Description and Use of the preceding Table.—In the above table are contained the logarithm of all numbers, from 1 to 10,000, which may be found by inspection, according to the method described below; but it will be proper, before we enter upon that subject, to make a few remarks with regard to the index, or characteristic, of logarithms, which are omitted throughout, and must therefore be supplied by the operator, according as the case may require. It has been shewn that the base, or radix of the system, is 10; and since

$$10^0 = 1, 10^1 = 10, 10^2 = 100, 10^3 = 1000, \&c.$$

therefore the log. of $1 = 0$, the log. of $10 = 1$, the log. of $100 = 2$, the log. of $1000 = 3$, &c ; and, consequently, the logarithm of any number between 1 and 10 has its logarithm greater than 0, and less than 1; a number between 10 and 100 has its logarithm greater than 1, and less than 2; between 100 and 1000 the logarithm is greater than 2, and less than 3, and so on; therefore, the integral part of the logarithm, or its index, is always one less than the number of its integral places. Again, since

$$\frac{1}{10} = 10^{-1}, \quad \frac{1}{100} = 10^{-2}, \quad \frac{1}{1000} = 10^{-3},$$

it follows, that the logarithm of $.1 = -1$, of $.01 = -2$, of $.001 = -3$, &c.; consequently, the logarithm of a number between 1 and $.1$ has its index properly 0, and its decimal part negative; but for the greater convenience, and this is one great advantage attending Briggs's logarithms, we may assume the index negative, and the decimal part positive; that is, instead of subtracting the decimal part from unity, and making the result negative, we retain the decimal as it arises, and make the index negative: whence, the logarithm of a decimal greater than $.1$, has its index $= -1$; if it be less than $.1$, but greater than $.01$, the index is -2 ; if it be less than $.01$, but greater than $.001$, the index is -3 ; and so on: whence it follows, that the index of the logarithm of any decimal is negative, and always one more than the number of ciphers which precede the first effective figure. Or both rules, *viz.* for integers and decimals, may be reduced to one, which is as follows. The index of the logarithm of any number is always equal to the number of places that the decimal point is distant from the unit's place, being positive if the decimal point be to the right of the unit's place, and negative if it be to the left of it. What has been said will be illustrated by the following examples:

Numbers.	Logarithms.
34560	4.5385737
3456 0	3.5385737
345 60	2.5385737
34.560	1.5385737
3.4560	0.5385737
.34560	— 1.5385737
.034560	— 2.5385737
.0034560	— 3.5385737
.00034560	— 4.5385737

These examples will illustrate all that has been said with regard to the index, and at the same time will shew the great advantage of the present system of logarithms; for here the tabular part of the logarithm is the same throughout, whereas with any other radix, each of the numbers would have required a different logarithm; and, consequently, much more extensive tables than any of those now in common use would be necessary under those circumstances.

To find the logarithm of any number by the table.—If the number consists of less than three figures, annex a cipher to it, or two if necessary, considering it as a decimal, and look

for the number thus increased in one of the first columns of the table, marked N, and the number in the adjacent column is the decimal part of the logarithm, to which prefix the proper index according to the above rule.

If the number consists of three figures, it may be found immediately in one of the first columns, and its logarithm in the adjacent column, to which prefix the proper index as above.

If the number consists of four figures, look for the first three in the column marked N, and seek the fourth figure in the line at the head of the page; and trace it down to the line in which the three first figures are found, and the meeting of the two lines will give the logarithm required; to which prefix the proper index. Thus,

The log. 34 = log. 34.0 = 1.5314789
 The log. 6 = log. 6.00 = 0.7781513
 log. 456 = 2.6589648
 log. 4569 = 3.6590506
 log. 45.69 = 1.6590506.

If the number consists of more than four places, find the logarithm answering to the first four as above, and for the rest multiply the number standing in the corresponding column of difference, by the remaining figures of the proposed number, and cut off from the right hand of the product as many figures as the multiplier consists of, and add the other part of it to the right-hand figures of the logarithm before found; then prefix to that sum the proper index, according to the rule above given. Thus, to find the logarithm of 34.6782;

$$\begin{array}{r} \log. \quad 34.67 = 1.5391604 \\ \qquad\qquad\qquad 102 \\ \hline \log. \quad 34.6782 = 1.5391706 \\ \hline \end{array} \qquad \begin{array}{r} \text{Diff.} = 125 \\ \qquad\qquad 82 \\ \hline \qquad\qquad 250 \\ \qquad\qquad 1000 \\ \hline \qquad\qquad 102(50) \end{array}$$

and in the same manner the logarithm of any number whatever may be found.

To find the number answering to any given logarithm by the table.—Seek for the decimal part of the logarithm in one of the columns of the table, and if it be found there *exactly*, the corresponding number is that required, the first three figures of which will be found in the column marked N, and the fourth in the head line of the table. Then point off the proper number of integers or decimals by the converse of the rule given in the preceding article, *viz.* the unit's place must stand so many places to the right or left of the first figure, as is denoted by the index; to the right if that index be positive, and to the left if negative.

Thus, the natural number answering to the logarithms

2.5434472 is 349.5
 -2.5434472 is 0.03495

when 9 in the first, and 0. in the second, are made the places of units agreeably to the rule. But if the logarithm be not found exactly in the table, then seek the next greater and the next less, as also the difference between the less and the given logarithm, and between the less and the greater; which will be found in the corresponding column of difference; divide the former difference by the latter, and annex the quotient to the right-hand of the four figures before taken out, which will be the number required. remembering to point off the decimals according to the rule.—Note, The above quotient cannot be depended upon for more than two places

L O G

Find the number corresponding to the logarithm

$$2.5430987.$$

$$\text{Next greater log. } 2.5431086 \quad \text{Given log. } 2.5430987$$

$$\text{Next less log. } 2.5430742 \quad \text{Next less } 2.5430742$$

$$\text{Tabular differ. } 1244 \quad \text{Differ. } 245$$

$$1244)245.00(19$$

$$1244$$

$$12060$$

$$11196$$

$$864$$

Therefore 349.219 is the number sought, the first four figures being the number answering to the least logarithm.

To perform arithmetical operation by logarithms.

Multiplication by logarithms.—Take out the logarithms of the factors from the table, and their sum will be the logarithm of the product sought; then, by means of the table, find the natural number answering to that logarithm, which will be the product required. Observing to add what is carried from the decimal part of the logarithm to the affirmative index, or indices, or subtract it from the negative. Also adding the indices together if they are of the same kind; *viz.* all positive, or all negative, but to subtract them if they be of different kinds, prefixing the sign of the greater to the remainder. Thus,

$$\text{Multiply together } .7684, 68.42, \text{ and } .34876$$

$$\text{log. of } .7684 = -1.8855874$$

$$\text{log. of } 68.42 = 1.8351831$$

$$\text{log. of } .34876 = -1.5425267$$

$$\text{Product } 18.3357 = 1.2632972$$

Division by logarithms.—Here the logarithms are to be taken out as above, and then the logarithm of the divisor must be subtracted from that of the dividend, and the remainder will be the logarithm of the quotient sought, observing to change the sign of the index of the divisor from affirmative to negative, or from negative to affirmative; then take the sum of the indices, if they be of the same kind, or subtract them if they be of different kinds, prefixing the sign of the greater for the index. Also, if *r* is borrowed in the left-hand place of the decimal part of the logarithm, add it to the index of the divisor when that index is affirmative, but subtract it when negative; then let the sign be changed, and worked with as before. Thus, for example,

$$\text{Divide } 37.149 \text{ by } 523.67$$

$$\text{log. } 37.149 = 1.5699471$$

$$\text{log. } 523.67 = 2.7190577$$

$$\text{Quotient } .0709397 = -2.8508894$$

Evolution, or raising of powers by logarithms.—Multiply the logarithm of the given number by the index of the power to which it is to be raised; and the product will be the logarithm of the power required. But in multiplying a logarithm with a negative index, the product will be negative, but what is carried from the decimal part will be positive, and must, therefore, in that case, be subtracted from that product.

VOL. XXI.

L O G

Hence, to find the cube of .327146

$$\text{log. of } .327146 = -1.4873479$$

$$3$$

$$\text{Power } .0289758 \quad -2.4620347$$

Evolution, or the extraction of roots by log. with ns.—Divide the logarithm of the given number by the index of the power, the root of which is to be extracted, and the quotient will be the logarithm of the root required; observing, that if the index of the logarithm be negative, as many units must be borrowed as will make it exactly divisible, and so many units must then be carried to the decimal part of the logarithm, and the division carried on as usual.

Required the cube root of .12345

$$\text{log. } 12345 \quad 3) -1.0914911$$

$$\text{Root } .497925 \quad -1.6971637$$

These are the most simple cases in which logarithms are introduced into arithmetical operations; the application of them to more complex cases, as in Trigonometry, Mensuration, &c. will be explained under the respective heads.

LOGARITHM, *Imaginary*, is used for the logarithm of negative and imaginary quantities, such as $-a$, $\sqrt{-a}$, &c. Thus, also, the fluents of certain imaginary fluxionary expressions, such as $\frac{x}{x\sqrt{-1}}$, $\frac{a\sqrt{-1}}{2bx\sqrt{-1}}$, &c. are imaginary logarithms. Euler Anal. Infin. vol. i. p. 72. 74.

The expression $\frac{x}{x}$ represents the fluxion of the logarithm of x , and the fluent, therefore, of $\frac{x}{x}$ is the logarithm of x ;

but no logarithm can represent the fluent of $\frac{x}{x\sqrt{-1}}$, which is therefore called an imaginary logarithm.

However, when these imaginary logarithms occur in the solutions of problems, they may be transformed into circular arcs or sectors; that is, the imaginary logarithm, or imaginary hyperbolic sector becomes a real circular sector. See Bernoulli, Oper. tom. i. p. 400. and p. 512. MacLaurin's Fluxions, art. 702, seq. Walmsley, Anal. des Mes. p. 63.

LOGE, in *Geography*, a town of Germany, in the county of Hoya; 20 miles S.W. of Nienburg.

LOGGERHEAD KEY, or *El Cento*, a small island in the bay of Honduras, near the coast of Yucatan. N. lat. 21° 25'. W. long. 87° 45'.

LOGGERHEAD, in the *Sea Language*, denotes a large round ball of iron, with a long handle for heating pitch.

LOG-HOUSES, houses in America, which are generally the first that are erected on any new settlement, and which are cheaper than any others in a country where wood abounds. The sides consist of trees just squared, and placed horizontally one upon the other; the ends of the logs of one side resting alternately on the ends of those of the adjoining sides, in notches; the interstices between the logs are stopped with clay; and the roof is covered with boards or shingles, which are small pieces of wood in the shape of slates or tiles, &c. which are used for that purpose, with few exceptions, throughout America. These habitations are not very tightly, but when well built they are warm and comfortable, and last for a long time. Some of them are built with brick.

or stone, or else constructed with wooden frames, sheathed on the outside with boards.

LOGIC, the art of thinking justly; or of making a right use of our rational faculties, in defining, dividing, and reasoning: or, as it is defined by an excellent writer on this subject, logic is the art of using reason well in our enquiries after truth, and the communication of it to others. Watts.

The word is Greek, λογικόν, derived from λογος, *sermo, discourse*; in regard thinking is only an inward, mental discourse, wherein the mind converses with itself.

Logic is also sometimes called *dialectica*; and sometimes the *canonical art*, as being a canon, or rule for directing us in our reasonings.

As, in order to think aright, it is necessary that we apprehend, judge, discourse, and dispose, or methodize, rightly: hence perception or apprehension, judgment, discourse or reasoning, and disposition, whence results method, become the four fundamental articles of this art; and it is from our reflections on those operations of the mind that logic is, or ought to be, wholly drawn.

Lord Bacon divides logic into four branches, according to the ends proposed in each: for a man reasons, either to find what he seeks, or to judge of what he finds, or to retain what he judges, or to teach what he retains; whence arise so many arts of reasoning; *viz.* the art of *inquisition*, or invention; the art of *examining*, or judgment; the art of *preserving*, or of memory; and the art of *elocution*, or delivery.

Logic, having being extremely abused, is now in some disrepute. The schools have so clogged it with barbarous terms and phrases, and have run it out so much into dry useless subtleties, that it seems rather intended to exercise the mind in wrangling and disputation than to assist it in thinking justly. It is true, in its original, it was rather intended as the art of cavilling than of reasoning; the Greeks, among whom it had its rise, being a people who piqued themselves mightily upon their being able to talk *extempore*; and to argue, by turns, on either side of the question.—Hence their dialectic, to be always furnished with arms for such rencontres, invented a set of words and terms, rather than rules and reasons, fitted for the use of contention and dispute.

Logic, then, was only an art of words, which frequently had no meaning, but served well enough to hide ignorance instead of improving knowledge; to baffle reason instead of assisting it: and to confound the truth instead of clearing it. Much of that heap of words, and rules, which we have borrowed from the old logic, is of little use in life; and is so far out of the common usage, that the mind does not attend to them without trouble: and finding nothing in them to reward its attention, it soon discharges itself, and loses all ideas it had conceived of them.

But logic, disengaged from the jargon of the schools, and reduced into a clear and intelligible method, is the art of conducting the understanding in the knowledge of things, and the discovery of truth.

From its proper use we gain several very considerable advantages: for, 1. The consideration of rules incites the mind to a closer attention and application in thinking: so that we hereby become assured, that we make the best use of our faculties. 2. We hereby more easily and accurately discover and find out the errors and defects in our reasoning; for the common light of reason, unassisted by logic, frequently observes an argumentation to be faulty, without being able to determine wherein the precise failure consists. 3. By these reflections on the order and manner of the op-

erations of the mind, we are brought to a more just and complete knowledge of the nature of our own understanding. See SOUL and UNDERSTANDING.

LOGICAL CONCRETE. See CONCRETE.

LOGICAL Part. See PART:

LOGINOV, in *Geography*, a town of Russia, in the government of Tobolsk, on the Irtysh; 16 miles S.E. of Tara.

LOGISTA, the title of an officer at Athens, whose business was to receive and pass the accounts of magistrates when they came out of their office.

The logistæ were in number ten; they were elected by lot, and had ten euthym, or auditors of accounts, under them.

LOGISTIC, or LOGARITHMIC Line, a curve so called, from its properties and uses, in constructing and explaining the nature of logarithms.

If the right line A X (*Plate XI. Analysis, fig. 4.*) be divided into any number of equal parts, and to the points of those divisions, A, P, p, &c. be drawn lines continually proportional, the points N, M, m, &c. form the logistic or logarithmic line or curve.

Here the abscissas A P, A p, &c. are the logarithms of the semiordinates P M, p m, &c.

Hence, if A P = x, A p = v, P M = y, p m = z, and the logarithms of y and z = l y and l z; x will be = l y, and v = l z; consequently x : v = l y : l z; that is, the denominators of the ratios A N : P M, and A N : p m, are to one another as the abscissas A P and A p.

Hence it follows, that there may be infinite other logistic lines invented: provided x m : v m :: l y : l z, that any of the roots, or powers, may be the logarithms of the semiordinates. The logistic will never concur with the axis, except at an infinite distance; so that A X is its asymptote. See LOGARITHMIC Curve.

LOGISTIC, *Quadrature of the.* See QUADRATURE.

LOGISTIC, or Logarithmic spiral, a line whose construction is as follows: Divide the quadrant of a circle into any number of equal parts, in the points N, n, n, &c. (*Plate XI. Analysis, fig. 5.*) and from the radii C N, C n, C n, &c. cut off C M, C m, C m, &c. continually proportional, the points M, m, m, &c. form the logistic spiral.

The arcs, therefore, A N, A n, &c. are the logarithms of the ordinates C M, C m, &c. whence also it follows, that there may be infinite logistic spirals. See SPIRAL.

LOGISTICA, or LOGISTICAL Arithmetic, a denomination sometimes given to the arithmetic of sexagesimal fractions, used by astronomers in their calculations.

It was so called from a Greek Treatise of one Barlaamus Monachus, who wrote about sexagesimal multiplication very accurately; and intitled his book *Αριθμητική*. This author Vossius places about the year 1350, but he mistakes the work for a treatise of Algebra.

Shakerly, in his *Tabule Britannicæ*, has a table of logarithms adapted to the sexagesimal fractions; which, therefore, he calls logistical logarithms; and the expeditious arithmetic of them, which is by this means obtained, and by which all the trouble of multiplication and division is saved, he calls logistical arithmetic.

LOGOGRAPHI, Λογιστογράφοι, among the *Ancients*, were the secretaries of the logistæ, and kept an account of the public revenues.

LOGOGRAPHY, derived from λογος, *word*, and γραφή, *I write*, a new mode of printing, in which the types correspond to whole words, and not, according to the usual method, to single letters. For this mode of printing a patent was obtained some years ago, and in the year 1783

the origin and utility of the art were stated in a treatise written by Henry Johnson. From the year 1778 he made several successful attempts for the practice of this art. The author has undertaken to demonstrate several advantages belonging to this method of printing; *viz.* 1. That the compositor shall have less charged upon his memory than in the common way. 2. That it is much less liable to error. 3. That the type of each word is as easily laid hold of as that of a single letter. 4. That the decomposition is much more readily performed, even by novices, than that of mere letters. 5. That no extraordinary expence nor greater number of types is required in the logographic than in the common method of printing. For other particulars, we must refer to the author's own account of the invention. See STEREOGRAPHY.

LOGOGRIPIHUS, from the Greek *λογος*, *discourse*, and *γρίπος*, or *γρίπος*, *net*, a kind of symbol, or riddle, proposed to students for their solution, in order to exercise and improve the mind.

The logogriphus usually consists in some equivocal allusion, or mutilation of words; which, literally taken, signify something different from the thing intended by it; so that it is a kind of medium between a rebus and proper enigma.

According to Kircher, logogriphi are a kind of canting arms: thus a person called Leonard, who bore in his arms a lion and nard, or spokenard, according to that father, made a logogriphus. *Ædip. Egypt.*

In another place, the same author defines logogriphus to be an enigma; which, under one name or word, will bear various meanings, by adding or retrenching some part of it. This kind of enigmas is well known to the Arabs; among whom are authors who treat expressly of it.

LOGONE, in *Geography*, a town of Hindooistan, in Viliapour; 10 miles N. of Poonah.

LOGONI, a town of Sardinia; nine miles E. of Cagliari.

LOGORAS, a town of Syria; 15 miles N. of Antioch.

LOGOS, *λογος*, Gr. *לוגה*, Chald. (*memra*), or *word*, Eng. in *Philosophy* and *Theology*, a term very differently understood and applied by both ancient and modern writers. Those who believe that the logos was the personification of the divine intellect, or of the divine attributes of wisdom, power, &c. trace this doctrine to the ancient Platonists, from whom, as they conceive, it was adopted by the Christian fathers. It must be acknowledged, however, that Plato expresses himself with a considerable degree of obscurity on this subject. Whilst he ascribes the origin of the universe to the Supreme God, whom he denominates *αγαθος*, or the good, without the instrumentality of any subordinate being whatever, and who is represented as having formed it according to a pattern previously formed in his own mind; he sometimes leads us to conceive that he regarded this pattern or idea of the divine mind as a *second principle* of things, and the world itself, which was produced from those ideas, as a *third principle*. But it does not satisfactorily appear that he made the divine mind, *i. e.* *νοος* (*nous*) or *λογος* (*logos*) a distinct intelligent being. His Demiurgus, or immediate maker of the world, seems to have been the Supreme Being himself, and not any subordinate agent or principle whatever. The reason, or logos, which, according to him, comes from God, and by which he made the universe, seems, in his view of it, to have been synonymous with *διάνους* and *επιστημης*, of his understanding, and not any other proper person or agent. In the writings of Plato, logos has only two acceptations, *viz.* those of *speech*, and of *reason*, such as is found in man. But when this philosopher

speaks of *νοος*, or *λογος*, as something distinct from the Divine Being himself, as a power or property belonging to him, and all divine power and properties being *substance*, it would be very natural and easy to transform this divine power into a substantial person; and this we shall find to have been the case with respect to the later Platonists, agreeably to one of the Platonic maxims, *viz.* that *being* and *energy* are the same thing. Philo, a learned Jew of Alexandria, and contemporary with the apostles, approached more nearly to a real personification of the logos than Plato himself, or his immediate followers. Although he did not proceed so far as some of the Platonizing Christians, and make a permanent intelligent person of the divine logos, he made of it an occasional one, representing it as the visible medium of all the communications of God to man, and of the instrument by which he both made the world and maintained an intercourse with the patriarchs of the Old Testament. Philo dignifies this logos with the appellation of God; but in order to distinguish him from the Supreme God, he says, that the latter is known by the term God with the article prefixed to it, *the God*; whereas the logos, like other inferior gods, is only called *God*, without the article. Whilst he ascribes proper creation to God the father only, he attributes the *forming* of created matter to the logos. The Jews did not, in general, use the term logos, or *לוגה* (*memra*) which corresponds to it in the Platonic sense, but as synonymous to God, or the mere token, or symbol, of the divine presence. Instances occur in various passages of the Old Testament, and a similar phraseology may be found in the "Wisdom of Solomon," which some have ascribed to Philo. The Christian Platonists, deriving their notions from the school of Alexandria, and the resemblance discernible in some of the doctrines of Plato to those of the sacred scriptures, could not help thinking, that he had actually borrowed them from the writings of Moses, with which, as they thought, he might have been acquainted during his residence in Egypt, or on his travels in the East. This opinion is frequently expressed and inculcated by Justin Martyr, and others of the fathers. A modern writer (see Priestley's *Early Opinions*) affirms, that Justin was the first, or one of the first, who advanced the doctrine of the permanent personality of the logos; of whom he says, "Jesus Christ is the only proper son of God, being his logos, first born and powerful." Many of the Christian fathers, however, maintained that the logos was an *attribute* of the Father, and that this attribute became the person of the Son, and was afterwards united to Jesus Christ. But we should enlarge this article far beyond its proper limits, if we cited more authorities in relation to this subject. We must therefore content ourselves with presenting to our readers a brief account of the sentiments of modern divines with regard to the logos. It has been very generally allowed that this name belongs, in a peculiar and appropriate sense, to Jesus Christ; of whose nature and rank of being different notions have been entertained. (See ARIANS, SABELLIANS, SOCINIANS, TRINITARIANS, and UNITARIANS. See also PRE-EXISTENCE of Christ and TRINITY.) We shall here subjoin a brief abstract of these opinions from some of the principal writers on this subject. The Pseudo-Athanasians, as they are denominated by the author of "The Apology of Ben Merdecas &c." seem to maintain, that the logos, or word of God, and that God, with whom he was in the beginning, and whose son he is, and the Holy Spirit, who proceeds from them both, are each of them, *singly*, the one Supreme God; and yet the three all *together* are the same Supreme God. To this purpose Dr. Clarke, in his "Scripture Doctrine of the Trinity," mentions the interpretation which some have

given of the phrase, "the word was God" (John i. 1.) The *logos*, or *word*, is conceived by such persons to be another self-existent, underived, independent person, co-ordinate in essential supreme authority and dominion with the Father Almighty: and this, says Dr. Clarke, whatever metaphysical union may be imagined of two such co-ordinate persons, will always and necessarily, in the religious and moral sense, be real polytheism; subverting that first and great foundation of all religion, both natural and revealed, the monarchical unity of the great King and God of the universe; and directly contrary to that first and great commandment in both Testaments (Deut. vi. 4. and Mark xii. 29.) "Hear, O Israel, the Lord our God is one Lord, &c."

Another opinion with respect to the *logos*, is that which supposes the appellation to designate a pre-existent spirit, of inconceivably exalted rank, and possessing supereminent power and perfection, which derives being from an immediate act of the power and will of God, in contradistinction to existence by mere necessity of nature, and called only begotten because it is thus derived from the Father in a singular and inconceivable manner, and so as to be thus distinguished from all other beings. This pre-existent spirit, or *logos*, according to the doctrine of Apollinarius about the year 370, and the Arians, descended from heaven, and supplied the place of a soul in Christ. To this purpose Mr. Whitton says, "the scripture, and earliest antiquity, never affirm, that Christ took a human rational soul; they never say, he took a whole human nature: they never say, that he was in that sense a true and perfect man; but that he was made flesh; had a body prepared for him; was the Word, or a God incarnate; was made in the likeness of man; was found in fashion as a man, while he was God the word. Nay, Ignatius directly affirms, that it was the Word, and not a human soul, which inhabited in that body; and almost all the ancients agree in the same doctrine; even Athanasius himself, before the council of Nice." It is said by Ben Mordecai, that notwithstanding the pains that were taken to discourage this opinion, it appeared again, in different shapes, in the Christian church in the doctrine of the Monothelites; who held, that Christ had only one will, which, without doubt, is sufficient for one person. Agreeably to this same use of the appellation *logos*, Dr. Clarke interprets the several passages that pertain to it in the 1st chapter of the gospel of St. John. In this sense "the word was with God;" not *ἐν τῷ θεῷ*, in God, as reason or understanding is *in* the mind, but *πρὸς τὸν θεόν*, with God, as one person is present with another; and "the word was God;" not *θεὸς ὢν*, is God, but *θεὸς πρὸς*, was God, or that visible person, who under the Old Testament appeared from the beginning *ἐν μορφῇ θεοῦ*, the visible image of the invisible God, in whom the name of God was, the angel of the Lord, &c. Phil. ii. 6. Col. i. 15. Exod. xxiii. 21. Zech. xii. 8. &c. &c. If this be the right interpretation of the text, then the words, *ἐν ἀρχῇ πρὸς τὸν θεόν*, in the beginning was the word, and *ὁ λόγος σὰς ἐγένετο*, the word was made flesh, mean, that the same person who in the fulness of the time was made man and dwelt with us, did before dwell with God, and acted in the capacity of a divine person, as the visible image of the invisible God, by whom God made all things, and by whom all things were from the beginning transacted between God and the creature; and as he is styled (1 Cor. i. 24.) the Power of God, and the Wisdom of God, upon account of the wisdom and power of God being manifested in and by him; so here he is styled (*ὁ λόγος*) the Word, because he does *ὡς λόγος*: he does, as Revealer, Lawgiver, and Judge, declare the will, the laws, the sentence of his Father. These who adopt this opinion also maintain,

that Christ was the person, by whom God created and governs the world, and that in and by him the Deity appeared to men under the Old Testament by the name of Jehovah, the Angel of the covenant, and similar appellations. The apostle tells us (Heb. i. 2. xi. 3.) that it was by Christ God made the world, *ἀρχαί*, the ages or dispensations; i. e. by whom, says Ben Mordecai, God formerly disposed and ordered those eminent and remarkable periods of time: the Antediluvian, the Patriarchal, the Mosaic, and the Present, being put under his government, according to the will of the Father. Now the ages or dispensations before Christ, we know from our own scriptures, were ordered by the angel Jehovah; and if he were not the Christ, the Old and New Testament contradict one another; by ascribing the same government to two different beings. St. Paul therefore could mean no other person by Christ, than the same *logos* or word of God; whom Philo, and all of that age, understood to be the angel of the covenant, or the angel Jehovah. The same truth is confirmed by many other references in the gospels and epistles; in which the sense is defective, upon any other principle.

There is another opinion concerning the *logos*, which has had many advocates among modern divines, and especially among those who are denominated Unitarians. Persons of this description understand by the *logos*, either not a real person, or God himself. Accordingly some of them interpret the passage above cited in the following manner: "In the beginning was Reason, and Reason was with God, and Reason was God." But the sense of these propositions amounts to nothing more, as Dr. Clarke has stated it, than that God always was a rational being; or if we understand by *logos*, the wisdom, or power, or any of the attributes of God, the conclusion will be much the same. This, we must allow, is in itself a certain truth; and, as to the manner of the expression, it might perhaps in some sense, by a figurative way of speaking, be affirmed, that the reason of God, or any one of his attributes, is God; yet this is nothing to the purpose of (what St. John is here treating of) the incarnation of Christ. For the reason of God is no otherwise God, than the reason of a man is the man himself. According to this interpretation, therefore, all those declarations of scripture, in which it is affirmed that "the word was made flesh and dwelt among us (John i. 14.), that Christ "came forth from the Father (John xvi. 28.), that "he came down from heaven (John iii. 13.), that "he came down from heaven, not to do his own will, but the will of him that sent him (John vi. 38.), that he "took part of flesh and blood (Heb. ii. 14.), that, having been "in the form of God," he did (*κεῖται ἑαυτοῦ*) empty himself of that form, "and was made in the likeness of man," and "found in fashion as a man," (Phil. ii. 6, 7, 8.):—All these expressions (according to this last interpretation of the words, *θεὸς πρὸς ὁ λόγος*), will in reality mean nothing more than that "the wisdom of the Father dwelt in the "Man Christ Jesus;" that is, that Christ was only in a more perfect and continued manner than other prophets, "an inspired man." Nothing, says Dr. Clarke, can be more forced and unnatural than this interpretation. It is reducing the whole doctrine of the humiliation and incarnation of the son of God to a mere figure of speech; and under the appearance of speaking of Christ as the Supreme God, making him really nothing but a mere man. This, however, would serve the purpose of those who are advocates for the simple humanity of Christ.

Dr. Lardner, in his "Letter on the Logos, written in the year 1730," professes, that he was once favourable to the supposition, that the *logos* was the soul of our Saviour; but being at a loss to conceive how that high being, the first and only

only immediately derived being by whom God made the world, should gain any exaltation by receiving after his resurrection and ascension, a bright resplendent human body, and being made the king and lord of all good men in this world, and the judge of mankind, and being made higher than the angels, to whom he was vastly superior before, abandoned this hypothesis, as throughout inconceivable, and irreconcilable to reason. Having stated some difficulties, which have been since repeatedly urged by Unitarians, and which those who are advocates for the pre-existent dignity of Christ are far from thinking to be incapable of a satisfactory solution, and having given interpretations of the passages that seem to intimate and to express the doctrine of our Saviour's pre-existence, he proceeds to explain the introduction to St. John's gospel. "In the beginning was the Word." By beginning he understands not the beginning of the gospel, as others of similar sentiments have understood it, but of the creation, or rather always from eternity. "was the Word." "And the word was with God;" that is, was always with God, though not fully manifested, till these last days of the world. "And the word was God;" sometimes rendered, though not correctly, "And God was the word." Notwithstanding the seeming tautology, he is of opinion, that God here is the same God that was mentioned before; and that St. John intends the one true God, not any inferior deity.

These passages still remain unsatisfactorily interpreted, whatever be the hypothesis concerning the *Logos* that is admitted; but this is not the place to pursue more at large the discussion of this point. Our theological readers will be led by this article to seek further information from those commentators and critics, who have expressly written on this subject.

LOGOTHETA, an officer under the emperors of the East, who kept an account of the various branches of public and private expence.

There were several kinds of them distinguished by the particular branch they superintended, as the *logotheta taxonomus*, or *post-master general*; *logotheta taxonomus*, or *master of the household*, &c.

LOGRONO, in *Geography*, a town of Spain, in Old Castile, on the Ebro; containing a court ofquisition, five parishes, eight convents, and about 5000 inhabitants. The environs produce fruit, legume, flax, hemp, excellent wine, oil, and silk: 20 miles N.W. of Calahorra. N. lat. 42° 23'. W. long. 3° 24'. Also, a town of South America, in the province of Quito; 40 miles E.S.E. of Cuenca.

LOGSTOR, or **LIXTOER**, a town of Denmark, in North Jutland, on Lynford gulf; 21 miles W. of Aalborg. N. lat. 57°. E. long. 9° 15'.

LOGSTOWN, a town of America, on the W. side of the Ohio; 18 miles from Pittsburg.

LOGUR, a town of Hindoostan; 20 miles W.N.W. of Poona.

LOGWOOD, in *Botany*, the wood of a tree; for the botanical characters of which, see *HEMATOXYLUM*. The wood of this tree is brought in logs of about three feet in length, to Europe, where it is used for dyeing purples, and for the finest blacks; and therefore it is a very valuable commodity.

The use of logwood in dyeing was established in this country by 13 & 14 Car. II. cap. 11. before which time it was prohibited as a pernicious material. A considerable part of the whole portion of the wood is taken up both by water and alcohol, but much more by the latter, and these menstrua become tinged by it of a deep purple-red or brown. To acids be added to the watery decoction, it is

turned yellow, but alkalies give a very deep purple colour, without yielding any precipitate. Alum, added to the decoction of logwood, causes a violet precipitate or lake, and the supernatant liquor also remains violet, and gives a fresh portion of lake on the effusion of an alkali. The salts of iron give an inky black with all the solutions of logwood, under the same circumstances as with galls, whence the presence of gallic acid in logwood is proved. The solutions of tin form a very fine violet-coloured lake with the decoction of logwood, and wholly precipitate the colouring matter, so that the supernatant liquor is quite clear and colourless. In dyeing, logwood gives its own natural purple, with shades or variations according to the mordant used, or it heightens and improves the common black with iron and galls. In this latter way it gives a peculiar gloss and lustre, on which account it is a very valuable dyeing material.

Logwood is used in miniature painting to make a purple wash; which may be varied to a more red or blue colour by the addition or omission of Brazil wood. The wash may be prepared by boiling an ounce of ground logwood in a pint of water, till one-half of the fluid be wasted: strain it then through flannel, while of a boiling heat; and add to it, when strained, about ten grains of pearl-ashes. To make it more red, add half an ounce of Brazil wood, or in proportion as the colour wanted may require; using in this case the pearl-ashes very sparingly. This wood has a sweetish subastringent taste, but a remarkable smell. It gives a purplish-red tincture to watery and spirituous infusions, and tinges the stools, and sometimes the urine, of the same colour; but it does not appear to colour the bones of animals.

Besides its use among dyers, it is employed medicinally as an astringent and corroborant. In diarrhoeas it has been found peculiarly efficacious; also in the latter stages of dysentery, when the obstructing causes are removed, it serves to obviate that extreme laxity of the intestines usually superinduced by repeated dejections. *Extractum ligni campechensis* is ordered in the pharmacopoeias, and may be given in the dose of one scruple or two, repeated according to the urgency of the symptoms. The extract is obtained by inspissating the decoctions. To promote the extraction, the wood should be reduced into a fine powder, which is to be boiled in the water, in the proportion of a pound to a gallon, till half the liquor is wasted. Some digest the powdered wood in as much spirit as will cover it to the height of about four inches, and afterwards boil it in water; the matters taken up by the watery and spirituous menstrua may be united into one extract, by inspissating the watery decoction to the consistence of honey, and then gradually stirring in the spirituous tincture.

Logwood Country, in *Geography*, a district of America, that lies N.W. of the Mosquito shore, at the head of the bay of Honduras, and extends from Vera Paz to Yucatan, from 15 to 18° N. lat. The whole end is overpread with islets, keys, and shoals, and the navigation is intricate.

Logwood Lager, a bay or gulf on the N.E. coast of Yucatan. N. lat. 20° 57'. W. long. 88° 21'.

Logwood Mill, in the *Manufactures*, is a machine for reducing logwood, or other dyeing woods, to small chips or raspings, that the colouring matter may be more readily extracted from them by the dyer. These machines are of two kinds: one, by means of knives fixed to a large wheel, which rips the wood across the grain into small fragments, which are afterwards reduced to a fine powder, by grinding them beneath a pair of rolling stones: this is called a *clipping engine*. The other kind operates by a steel bar, with a great number of notches in the edge, which rips and cuts the end of the wood into powder: this is called the *rasping engine*. Both machines require

require an immense power to actuate them, and are generally worked by water-wheels or by steam-engines. A plan and elevation of a rasping engine is given in *Plate XXXI. Mechanics*, *figs. 1 and 2*, where *A* is an iron cog-wheel, turned round by the large cog-wheel of a water-mill or steam-engine; its axis has an iron cylinder *B* fixed upon it, and this has a number of steel bars or knives *a* fixed in its circumference. The pieces of wood to be rasped are placed in a strong wooden trough, *DD*, in which an iron bar, *E*, slides, and forces the wood down to the cylinder, being moved by two racks, *F, F*, turned by pinions on an axis, *G*. At one end of this is a handle, *g*, and at the other a wheel, *h*, which is turned by a pinion, *k*, at the extremity of a long spindle, *HI*, which is turned by a wheel, *K*, whose teeth are engaged by threads of a worm or endless screw, *l*, cut on the end of the main axis. By this means the pinions are constantly turning round with a very slow motion, and advance the wood towards the cylinder, which is at the same time in motion, and its rasps cut the wood into powder. A section of the rasp cylinder is shewn in *fig. 3*, where the same letters are used. In this *m* is the groove in which tenants at the ends of the bar, *E*, slide. This bar has many large spikes in it, which fasten into the wood. At *n* is a strong iron plate at the end of the trough, to defend it from wearing away by the great pressure of the wood down upon it. The wood is kept down in the trough by the cross-bar, *L*, *fig. 2*, fixed down over them. The iron cylinder, *B*, is cast with 24 grooves in it lengthways, and in these are laid as many steel bars, *Y, Z*, *fig. 3*, the section of which is *X*. The angle, *r*, being ground to a sharp edge, and the side, *r s*, cut with teeth, as seen at *Z*, so that the edge is serrated, as shewn by *Y*, the knives are held in their grooves by a strong hoop, *n*, *fig. 2*, driven on the ends of the cylinder over the knives, and they are wedged in fast by small iron wedges. When the wood in the engine is all rasped, and it needs a fresh supply, the pinion, *k*, is disengaged from the wheel *h*, and then the wheel, *g*, being turned by a man, the racks are withdrawn. To disengage the pinion, *k*, its bearing is fixed in a beam, *O*, which swings on a hinge at the upper end, and the lower end has a rod, *p*, jointed to it, which is engaged by a catch, *r*, when the handle, *t*, at the extremity of the rod, is moved away from the cylinder, so as to engage the pinion, *k*, with its wheel, *h*. But on moving the end of the rod towards the cylinder, it is relieved from the catch, and the pinion is disengaged from the wheel; and to prevent the bar, *E*, going so far as to endanger its teeth meeting the rasps, a pin is fixed into a particular part of one of the racks, *f*, which takes hold of the rod, *p*, when it has got as far as intended, and removes the rod from the catch, *r*, and then the racks do not advance any farther to the rasps. The wheel at *R, S*, joining in the axes *H* and *I*, is called a friction box: it consists of an iron box, *R*, fixed on the end of the axis, *I*; its cavity receives a conical plug, *S*, fitted upon the end of the other axis, *HI*, and pressed into the box by a lever, *T*, loaded with a weight. By this means, if the wood does not rasp away so fast as the motion of the racks would advance it, the cone, *S*, slips round in the box, *R*, and allows for the difference of the movements, which would otherwise break the machine. The cylinders of rasping engines generally turn round from 15 to 20 times per minute, and will reduce a great quantity of wood to a powder in a short time. *Figs. 4 and 5* are two elevations of a *chipping engine*: here *A* is part of a strong iron axis, turned with a considerable velocity by water or steam: upon the end is a small circular flange, *B*, to which is bolted a circular iron-plate, *D*, in which four knives are fixed, so that their edges project a very small quantity before the

surface of the wheel in the manner of a plane iron. *E* is an iron frame containing the bearing for the pivot of the wheel; it has a small trough, *F*, cast all in one piece with it. All this iron work is screwed down to the wood framing, *G G*. The wood, *II*, is in this machine presented to the knives in the wheel by a man who holds it in the trough, and advances it as the knives cut away the end. These chips are cut across the grain but obliquely, as is evident from *fig. 4*: they are afterwards ground to a fine powder by a rolling stone, or runner upon edge. A large and heavy fly-wheel is usually fixed on the axis, *A*, of the chipping wheel to regulate its movement. A method of reducing logwood has been lately introduced by sawing it with a circular saw (see *SAW*), which cuts off a flake from the end of a piece of wood *x*, so that the jar of the saw shatters the flake all into powder. By this means, at every cut the saw cuts away as much wood as its thickness in saw dust and the flake, which is as much more, is reduced at the same time, so that all the wood is reduced, though only one-half is cut, whereas, in the rasping engine, every particle must be cut by the machine. This improvement merits the attention of the woollen manufacturers, whose numerous logwood mills would be much improved by the adoption of this method.

LOHA, a town of Algiers; 28 miles E. of El Callah.

LOHARCANA, a town of Nepal; 10 miles S. of Batgaon.

LOHARINAPPAUL, a town of Nepal; 15 miles S. of Catmandu.

LOHAROO, a town of Hindoostan, in Dooab; 10 miles N.W. of Patniary.

LOHE, a town of Austria; 12 miles W.S.W. of Crems.

LOHEIA, a town of Arabia, in the province of Yemen, on the coast of the Red sea, founded, about three centuries ago, by a Mahometan saint, who built a hut on the shore where the town now stands, and spent the rest of his days there as a hermit. After his death, a "Kabbat," or house of prayer, was erected over his tomb, and it was afterwards gradually embellished and endowed. Some devout persons resorted hither, and built huts for themselves about his tomb. The harbour of Macabra, a neighbouring town, being about this time filled up, the inhabitants who deserted it settled at Loheia, and transferred the seat of government to this place. The territory of Loheia is arid and barren; and the harbour is indifferent, so that at ebb-tide, laden boats cannot approach near it; but, notwithstanding this disadvantage, a considerable trade in coffee, brought from the neighbouring hills, is carried on in this town. The coffee is not so good as that which is procured by way of Mocha and Hodeida from Beit el Fakih, but it is purchased on more reasonable terms, and the carriage to Jidda is less expensive. On this account several merchants from Cairo reside at Loheia, and others annually resort hither for the purchase of coffee. In this town are also 40 poor Banians, who are employed in different trades. Loheia has no walls, but is defended by 12 towers garrisoned by soldiers, and placed at equal distances round it. The height of their gates render it necessary to ascend them by means of ladders. It is but one of these towers that admits of being defended by cannons. Thus exposed to the depredations of the Arabs, the inhabitants have been sometimes reduced to the necessity of leaving the town, and of taking refuge in a small island, whither they carry with them their most valuable effects. Several of the houses in Loheia are built of stone; but they are generally huts, constructed after the Arabian fashion; the walls consisting of mud mixed with dung, and the roof thatched with a sort of grass which is

common

common here. Around these walls is a range of beds made of straw, affording convenience for sitting or lying. These houses are not large enough to admit of being divided into separate apartments; they have seldom any windows, and the door is only a straw-mat. When an Arab has a family and cattle, he builds for their accommodation several such huts, and incloses the whole with a strong wooden fence. Lime is prepared in the neighbourhood of the town, by the calcination of coral from the sea in the open air, and without a furnace. The water at Loheia is very bad, and therefore they are supplied from the distance of $2\frac{1}{2}$ leagues, which is brought to them in earthen jars upon camels or asses. Within two leagues of the town is a small hill which affords considerable quantities of mineral salt. The inhabitants are curious, intelligent, and polished in their manners. The women wear large veils in the streets, and yet they have no objection to throw them aside before strangers. One of these females, who presented herself to view, had her brow, cheeks, and chin, ornamented with black spots, impressed into the skin, and her eyes were also artificially blackened. In this town they have all the instruments necessary for distilling brandy; they have also a sort of wine, prepared from an infusion of dry grapes in water, in a pot which is buried in the ground in order to make the liquor ferment. They have also a thick, white liquor, called "Bufa," prepared from meal mixed with water, and brought into a state of fermentation. Niebuhr.

LOHMEN, a town of Saxony, in the margravate of Meissen; 10 miles E.S.E. of Dresden.

LOHNIN, a town of Brandenburg; 10 miles S.E. of Brandenburg.

LOHOCK. See LOCH.

LOHORPOUR, in *Geography*, a town of Hindoostan, in Oude; 20 miles S. of Mahomdy.

LOHR, a town of Germany, in the county of Rieneck, on the Maine; 21 miles N.W. of Wurzburg.

LOHR Hampton, a town of Germany, in the county of Hanau-Munzenburg; 22 miles E. of Hanau.

LOHRY, a town of Hindoostan, in Behker, on the Sinde; 15 miles S. of Behker.

LOHTO, a town of Sweden, in the government of Wafa; 18 miles N.E. of Gamla Karleby.

LOHURDEGA, a town of Bengal, in the circle of Nagpour; 22 miles N.N.W. of Doela. N. lat. $23^{\circ} 20'$. E. long. $84^{\circ} 51'$.

LOHURSEY, a town of Bengal, at which is a pass across the mountains; 18 miles N.N.E. of Pelamow.

LOIBERSTORFF, a town of Austria; 14 miles S. of Vienna.—Also, a town of Austria; 10 miles S.W. of St. Polten.

LOIHL, a range of mountains between Carinthia and Carniola.

LOIMAJOKI, a town of Sweden, in the government of Abo; 32 miles N.N.E. of Abo.

LOINS, in *Anatomy*, the lower and posterior part of the trunk of the body, or the space situated between the upper edge of the pelvis, and the last ribs. The inferior end of the vertebral column occupies the middle of this region; it is called the lumbar portion of the spine, and the vertebrae composing it are the lumbar vertebrae. (See SPINE.) The lowest of these rests on the upper surface of the sacrum, and thus joins the chest to the pelvis. This part of the spine is the centre of the reciprocal motions of the chest and pelvis; it is covered on each side, towards the back, by a thick mass of muscle, forming two convex prominences, with a hollow between them, corresponding to the spinous processes. These muscles are the great powers concerned

in extending the spine, and maintaining it erect. (See DORSI longissimus, and SACROLUMBALIS.) They are affected in strains of the trunk, and in lumbago, in which cases all motions of the loins are performed with great difficulty and pain. The sides of the lumbar region of the spine are covered by the psoas muscles, which belong to the hip-joint. The collections of matter forming serous abscesses are found in the cellular substance about these muscles. Close to the side of the spine, the interval between the crista of the os innominatum and the last rib is occupied by the quadratus lumborum muscle. (See LUMBORUM.) In front of this muscle, and of the psoas, the kidney lies, surrounded by loose cellular substance, which separates it from the peritoneum. (See KIDNEY.) The loins in front form a part of the posterior surface of the abdomen; and this is called the lumbar region.

LOJO, in *Geography*, a town of Sweden, in the province of Nyland; 30 miles W. of Helsingfors.

LOJOBI, a town of Servia; 16 miles S.S.E. of Passarowitz.

LOIR and CHER, one of the nine departments of the central region of France, so called from the names of the rivers which traverse it, the former in the southern part, the other in the north, and composed of Blois and Sologne, districts of Orleansais, is situated in $47^{\circ} 40'$ N. lat., S.E. of Sarthe, and bounded on the N. by the department of the Eure and Loire, on the N.E. by the Loiret, on the E. and S.E. by the Cher, on the S. by the Indre, and on the W. by the Indre and Loire, and Sarthe. It is 34 French leagues in length, and 23 broad, and contains $6717\frac{1}{2}$ kilometres, or about 339 square leagues, and 211,152 inhabitants. It is divided into three districts or circles, 24 cantons, and 309 communes; the circles are Vendome, containing 68,330, Blois, including 103,268, and Romorantin, comprehending 39,554 inhabitants. Its contributions amount to 2,432,733 francs, and its expences to 270,286 fr. and 19 cents. Its capital is Blois. The soil of this department is partly sandy and partly fertile; yielding grain, wine, fruits, and pastures. It abounds in lakes, marshes, and heaths, with considerable forests, iron-mines, &c.

LOIRE, one of the 11 departments of the eastern region of France, formerly Forez, situated in $45^{\circ} 30'$ N. lat., west of the Rhone, 24 French leagues long and 12 broad, contains 5135 kilometres, or 259 square leagues, and 292,588 inhabitants. It is divided into three circles, 48 cantons, and 327 communes. The circles are Roanne, containing 95,668, Montbrison, 97,659, and St. Etienne, 90,261 inhabitants. The contributions amount to 2,745,417 fr. and its expences to 244,800 fr. and 66 cents. Its capital is Montbrison. This department is diversified with plains, hills, and mountains. Both banks of the river Loire, from which it derives its appellation, are level, yielding grain, hemp, and pastures. The gentle eminences near Roanne are covered with vines. Mont-Pilat, a ridge of high mountains, is situated at the S.E. extremity of the department, near the confines of Ardèche. Here are forests and mines of iron, lead, and coal.

LOIRE, *Upper*, one of the 12 departments of the south-east region of France, composed of Vevay and Cevennes, situated in 45° N. lat., south of Loire and Puy de Dôme, 26 Fr. leagues long and 17 broad, contains 5282½ kilometres, or 264 square leagues, and 237,901 inhabitants. It is divided into three circles, 28 cantons, and 272 communes. The circles are Brioude, containing 70,596, Le Puy 103,068, and Yssengeaux, 64,237 inhabitants. The capital is Le Puy. The contributions amount to 1,509,642 fr.

fr. and the expences to 219,838 fr. 23 cents. This territory, though mountainous and covered with snow six months in the year, yields grain, fruits, &c. sufficient for the inhabitants, with good pastures, mines of antimony, &c.

LOIRE, *Loire*, one of the nine departments of the western region of France, formerly Upper Bretagne, a maritime territory on either hand of the Loire, is situated in 47° 15' N. lat., is 30 Fr. leagues long and 27 broad, and contains 7600 kilometres, or 382 square leagues, and 368,506 inhabitants. It is divided into five circles, 45 cantons, and 209 communes. The circles are Savenay, comprehending 91,132, Chateau-Briant, 50,244, Ancenis, 36,049, Nantes, 157,940, and Paimboeuf, 32,241 inhabitants. Its capital is Nantes. Its contributions amount to 2,900,662 fr. and its expences to 345,171 fr. This department produces wheat, rye, flax, wine, and excellent pastures, with mines of iron, coal, quarries of marble, &c. Savenay yields cyder and wine of an inferior quality. The second circle is almost one continued forest. Nantes is agreeably diversified and fertile. From the marshes of Paimboeuf much salt is extracted.

LOIRET, one of the nine departments of the central region of France, a portion of Orléanais, E. of Loir and Cher, is situated in 47° 50' N. lat., is 30 Fr. leagues long, and 24 broad; and contains 7047½ kilometres, or 356 square leagues, and 280,728 inhabitants. It is divided into four circles, 31 cantons, and 303 communes. The circles are Pithivier, containing 55,061, Montargis, 61,912, Gien, 37,395, and Orleans, 135,360 inhabitants. Its capital is Orleans. Its contributions amount to 3,778,705 fr. and its expences to 337,821 fr. 52 cents. The soil of the second circle is sandy, yielding little grain. The products of the other districts are grain, wine, hemp, flax, fruits, and pastures.

LOIRON, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Laval; six miles W. of Laval. The place contains 1559, and the canton 13,810 inhabitants, on a territory of 280 kilometres, in 15 communes.

LOITSCH, or LOITZ, a town of Upper Carniola; 15 miles W. of Laybach.

LOITZ, a town of Anterior Pomerania; 24 miles S. of Stralsund. N. lat. 53° 56'. E. long. 13° 5'.

LOKACZ, a town of Poland, in Volhynia; 30 miles W.S.W. of Lucko.

LOKALAX, a town of Sweden, in the government of Abo; 27 miles N.W. of Abo.

LOKE, in *Mythology*, the name of one of the deities of the northern nations, answering to the Arimanes among the Persians, whom they represent as at enmity both with gods and men, and the author of all the evils which desolate the universe. Loke is described in the Edda as producing the great serpent which incircles the world; which seems to have been intended as an emblem of corruption or sin; he also gives birth to Hela or death, the queen of the infernal regions; and also to the wolf Fenris, that monster who is to encounter the gods and destroy the world. North. Ant. vol. ii. p. 85, &c.

LOKE, in *Rural Economy*, a provincial word used in Norfolk for a close narrow lane.

LOKMAN, in *Biography*, surnamed *Al-Hakim*, or the Wise, a philosopher in considerable estimation among the eastern nations, to whom is attributed a collection of maxims and fables, which are calculated to display the moral doctrines of the ancient Arabians. There have been many hypotheses concerning the country in which he lived, and the period at

which he flourished, but the greater part of the Mussulman doctors make him contemporary with David and Solomon. It has been supposed that he was a native of Ethiopia or Nubia, and in rather a servile condition; that he had been a slave in different countries, and that he was at length sold among the Israelites. His wisdom has been ascribed to divine inspiration, which he received in the following manner; while asleep at noon-day, angels came to the place where he was reposing, saluted him, without rendering themselves visible, and declaring that God would make him a monarch and his lieutenant on earth. He signified his submission to the will of his maker, but would rather have preferred to remain in a low condition. On account of this answer, God bestowed upon him wisdom in so eminent a degree that he was enabled to instruct mankind by a great variety of maxims, sentences, and parables, amounting to ten thousand in number. The anecdotes which are recorded concerning the life of Lokman are found scattered in the writings of several of the orientals; of these we shall notice only a few. As he was once seated in the midst of a circle of auditors, a man of high rank asked if he was not that black slave whom he had before seen attending upon the flocks in the field; he replied, he was; how then, said the other, have you attained to such wisdom and so high a reputation; "By following exactly," said Lokman, "these three precepts; always to speak the truth; to keep inviolably the promises made; and never to meddle with what does not concern me." It was Lokman who said that "the tongue and the heart, were both the best and the worst parts of men." Mahomet frequently refers to the authority of Lokman in support of his own opinions and doctrines, and he is still regarded by the followers of the Mahometan religion as a saint and a prophet. They represent him to have been as virtuous and pious as he was wise, and on that account was peculiarly blessed of God. Some writers assert that he embraced the Jewish religion, and entered into the service of king David, who entertained a high esteem for him, and that he died at a very advanced age. The scanty relics of the fables of Lokman were published by Erpenius, in Arabic and Latin, and Tannaquil Faber gave an edition of them in elegant Latin verse. Gen. Biog.

LOKMAN, in *Geography*, a town of the Arabian Irak, on the Tigris; 10 miles N. of Bagdad.

LOKO, a small island on the E. side of the gulf of Bothnia. N. lat. 60° 51'. E. long. 20° 59'.

LOKOHAR, a town of Hindoostan, in Bahar; 36 miles N.E. of Durbunga.

LOKTEVA, a town of Russia, in the government of Kolivan; 30 miles S.W. of Kuznetzk.

LOLBAZAR, a town of Bengal; 37 miles S.W. of Beyhar.

LOLBINIÈRE, a town of Canada, on the river St. Lawrence; 25 miles S.W. of Quebec.

LOLDONG, a town and fortress of Almora; 85 miles N.N.E. of Delhi. N. lat. 29° 47'. E. long. 78° 36'.

LOLGUNGE, a town of Hindoostan, in Oude; 16 miles N. of Manickpour.—Also, a town of Hindoostan, in Benares; 22 miles S.W. of Mitzapour.—Also, a town of Hindoostan, in Oude; 20 miles S. of Azemgur.

LOLICHMIUM, in *Greek Muses*, according to Pausanias, was the name given to the gymnasium at Olympia, which was always open for those who wished to contend in literature, poetry, or music; and Aelian tells us, that in the 94th olympiad, Euripides and Xenocles disputed the prize in dramatic poetry at the Olympic games; at which time they were accompanied by instruments.

LOLIUM, in *Agriculture*, the name of a kind of grasses,

of which there are several species, some of which are highly useful to the farmer, as the *lolium perenne*.

LOLIUM, in *Botany*, a Latin word of unknown origin.—Darnel, or Darnel-grass. Virgil calls it "*infelix lolium*," not only as being a weed amongst corn, but probably alluding to an idea, long prevalent, that corn was transformed into it. This opinion of the change of one kind of gramineous plant into another, as wheat into rye, rye into barley, barley into darnel, darnel into brome-grass; and of the latter by becoming oats or rye, in a fertile soil, returning again to a more improved state; all this, however absurd, was so generally believed, that Linnæus thought proper to write a dissertation against it. See *Tranmutatio Frumentorum*, Amoen. Acad. v. 5. 106.—Linn. Gen. 38. Schreb. 53. Willd. Sp. Pl. v. 1. 461. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 148. Aut. Hort. Kew. ed. 2. v. 1. 174. Juss. 31. Lamarck Illustr. t. 48. Class and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Gen. Ch. *Cal.* Common receptacle elongated into a spike, the flowers, which are disposed in two ranks, being pressed close to an angle of the stalk. Glume of one valve, awl-shaped, permanent, fixed, opposite to the stalk. *Cor.* of two valves; the lowermost lanceolate, narrow, convoluted, pointed, the length of the calyx; the uppermost shorter, linear, blunter, concave above. Nectary of two small, ovate, obtuse leaflets, gibbous at their base. *Stam.* Filaments three, capillary, shorter than the corolla; anthers oblong. *Pist.* Germen turbinate; styles two, capillary, reflexed; stigmas feathery. *Peric.* none; the corolla embracing the seed, and finally opening to let it fall. *Seed* one, oblong, convex beneath, with a broad shallow furrow above, compressed.

Obs. The sessile spikelets stand in the same plane with the stalk, so that the latter supplies the place of an inner valve to the calyx, which nevertheless is sometimes present, though diminutive.

Ess. Ch. Calyx of one valve, fixed, many-flowered. Florets two-ranked.

1. *L. perenne*. Perennial Darnel; Red Darnel; or Ray-grass. Linn. Sp. Pl. 122. Engl. Bot. t. 315. Mart. Rust t. 4. Knapp. t. 100.—Spike awnless. Spikelets longer than the calyx. Florets lanceolate.—A common European grass, in rather fertile ground, about the borders of fields, road sides, pastures, &c. flowering in June.—The root is fibrous, downy, perennial. Stem a foot high, erect or ascending, bent at the bottom, jointed, leafy, round in the upper part, striated, smooth. Leaves linear, keeled, smooth, dark green, with smooth, striated sheaths, and a short obtuse stipula. Spike nearly erect, very flat, often a little twisted.

A variety with a compound spike is figured by Leers, t. 12. f. 1; and another with a remarkably short broad and dense spike, in Scheuchz. Prodr. t. 2. Vaillant's t. 17. f. 3, with long awns, cited by Willdenow after Reichard, surely cannot belong to this species.

2. *L. tenue*; Linn. Sp. Pl. 122. Willd. n. 2, appears to be only a starved variety of *perenne*, with very few florets in each calyx.

3. *L. temulentum*. Bearded Darnel. Linn. Sp. Pl. 122. Fl. Dan. t. 160. Leers. 48. t. 12. f. 2. Engl. Bot. t. 1124. Knapp. t. 104. Host. Gram. Austr. v. 1. t. 26. Schreb. Gram. t. 36.—Spike awned. Spikelets shorter than the calyx. Florets elliptical. Stem rough in the upper part.—Native of European corn-fields, among barley, wheat, or flax, flowering in July.—Root annual, of a few downy fibres. Stem nearly solitary, twice as tall and stout as the former; erect, firm, of about three knots; very

smooth and shining in the lower part; rough above. Leaves lanceolate, spreading, ribbed, rough, of a lighter green than in *perenne*. Sheaths roughish. Stipula very short, crenate. Spike erect, larger and more turgid than in the former. Calyx without awns; in the lower spikelets often furnished with a minute, elliptical, inner valve. Florets numerous, ovate, swelling, slightly ribbed, rough, each tipped with an awl-shaped, whitish, rough, erect awn, twice its own length, from a little below the top.—The seeds are said to be intoxicating to men, beasts and birds, and even to bring on convulsions and death. We know of no mischiefs from it in this country, where it is far from common.

4. *L. arvense*. Annual Beardless Darnel. Withering 168. Engl. Bot. t. 1125. Knapp. t. 102. (*L. temulentum*; Hudf. 55.)—Spike almost beardless. Spikelets about the length of the calyx. Florets elliptical. Stem very smooth.—Native of fields in England and Scotland, as well as other parts of Europe. Willdenow indicates it as a variety of the last. It differs however, not only in being not at all, or very shortly, awned, but in the total smoothness of its stem and spike. The leaves are occasionally rough, but on their upper side only. Dr. Withering, who first defined this species, says the calyx has two valves; but we usually find only one. The awns are too large in the plate of *English Botany*.

5. *L. maximum*. Great West-Indian Darnel. Willd. n. 4.—"Calyx as long as the many-flowered compressed spikelet; of which the upper florets are awned."—Native of Jamaica. Root annual. Whole grass twice as large as *L. temulentum*, from which also it differs in having the calyx equal in length to the spikelet; and while the upper florets have long awns, the rest are beardless. Yet Willdenow, from whose work we adopt this species, suspects it may be but a variety of the second.

6. *L. distachyon*. Double-spiked Indian Darnel.—Linn. Mant. 187.—Spikes in pairs. Calyx single-flowered. Corolla fringed.—Sent by Koenig from the coast of Malabar.—Stems partly decumbent, slender, branched, smooth. Leaves short, narrow, with long, smooth, rather tumid sheaths. Spikes in pairs, terminal, equal, slender, two or three inches long. Flowers in two ranks, but directed to one side. Calyx of one valve, single-flowered. Corolla ovate, densely fringed with fine, long, white hairs. A singular grass, whose genus is at least doubtful. In some points it resembles a *Panicum*.

LOLIUM Perenne, the botanical name of the grass usually known to the farmers by the name of ray-grass: it has a perennial fibrous creeping root. The stems, several from the same root, prostrate or oblique at the base, but the flowering stem upright, smooth, from six inches to eighteen, twenty and twenty-four inches in height, according to the soil: they have several joints near the base, at a small distance from each other, but on the upper part only one or two. On a great number of plants of a middling size three joints, and never more than four, were counted by Miller, the flowering-stem running up from eleven to fourteen inches above the last joint. They are frequently russet-coloured at the joints; the leaves are four or five inches long, and from two to four lines wide, lengthened out into a point; the leaf on the stem above twice as broad as those next the root and on the runners. The sheath covers the stem for several inches above the upper joint; both that and the leaves are smooth. The flowers are in a spike, which is from four to six or seven, and even nine inches in length, composed of many two to eighteen spikelets, ranged at a little distance from each other, in two rows alternately along the rachis of a common receptacle. The spikelets gene-

vally flat, but sometimes nearly cylindrical; and it sometimes shews a disposition to become branched, particularly towards the bottom. The rachis is flexuous, or changes its direction in a curve line from one spikelet to another; and each spikelet being lodged at the base in a hollow of it, has no occasion for an inner valve to the calyx for protection, and therefore is not provided with one. The number of flowers in each spikelet varies from three or four to six, seven or eight, and even sometimes nine, ten, or eleven; but six or seven is the most common number. The valve of the calyx tapers to a point; and the terminating calyx is two-leaved. The two inner husks, which are the valves of the corolla, are both of the same length, or nearly so. The germ is placed between the upper of these, and two small white semitransparent tubercles, which Linnaeus terms the *nectaries*: the seed easily quits the chaff or covering.

This is a grass which is called in English a *ray-grass*, from the French *raye*, which is their name for another species, this being termed *Fausse raye*. It is corruptly termed by farmers *rie*, or *rye-grass*, but it bears no resemblance to *rie*, or *rye*, that being a name appropriated to a very different grass (*Hordeum pratense*). It has, likewise, by Ray been distinguished by the title of *Red Darnel-grass*; and in some places it is called *Crap*; in Devonshire, *Easer*; in Norfolk, *White Nonsuch*.

There are several varieties of this grass which differ chiefly in the size or colour of the stem and spike, as well as the number of flowers in each spikelet. Also the flowers are now and then found with awns or beards; and the spikelets are also sometimes clustered, and sometimes branched, or divided.

It is a sort of grass that has been long in cultivation as an early pasture and hay grass. See *ARTIFICIAL Grass*, and *RAY-GRASS*.

LOLLARDS, in *Eccllesiastical History*, a religious sect, differing in many religious points from the church of Rome, which arose in Germany about the beginning of the fourteenth century; so called, as many writers have erroneously imagined, from Walter Lollard, who began to dogmatize in 1315; and was burnt at Cologne: but it is evident that Lollard was no surname, but merely a term of reproach applied to all heretics who concealed the poison of error under the appearance of piety.

The monk of Canterbury derives the origin of the word Lollard, among us, from *lolum*, a *tare*; as if the Lollards were the tares sown in Christ's vineyard. Abilly says, that the word Lollard signifies *praising God*, from the German *loben*, to *praise*, and *herr*, *lord*; because the Lollards employed themselves in travelling about from place to place, singing psalms and hymns.

Others, much to the same purpose, derive *lollard*, *lullbard*, or *lollert*, *lullert*, as it was written by the ancient Germans, from the old German word *lullen*, *lullen*, or *lullen*, and the termination *bard*, with which many of the High Dutch words end. *Lullen* signifies to sing with a low voice, and, therefore, *lollard* is a singer, or one who frequently sings; and in the vulgar tongue of the Germans, it denotes a person who is continually praising God with a song, or singing hymns to his honour. The Alexians or Cellites were called Lollards, because they were public singers who made it their business to enter the bodies of those who died of the plague, and sang a dirge over them in a mournful and indistinct tone as they carried them to the grave. The name was afterwards assumed by persons that dishonoured it; for we find, among those Lollards who made extraordinary pretences to piety and religion, and spent the greatest part of their time in meditation, prayer, and such acts of piety, there were

many abominable hypocrites, who entertained the most ridiculous opinions and concealed the most enormous vices under the specious mark of this extraordinary profession. And many injurious aspersions were propagated against those who assumed this name, by the priests and monks; so that by degrees, any person who covered heresies or crimes under the appearance of piety, was called a Lollard. Thus the name was not used to denote any one particular sect, but was formerly common to all persons and all sects, who were supposed to be guilty of impiety towards God or the church, under an external profession of extraordinary piety. However, many societies, consisting both of men and women, under the name of Lollards, were formed in most parts of Germany and Flanders, and were supported partly by their manual labours, and partly by the charitable donations of pious persons. The magistrates and inhabitants of the towns, where these brethren and sisters resided, gave them particular marks of favour and protection, on account of their great usefulness to the sick and needy. They were thus supported against their malignant rivals, and obtained many papal constitutions, by which their institute was confirmed, their persons exempted from the cognizance of the inquisitors, and subjected entirely to the jurisdiction of the bishops; but as these measures were insufficient to secure them from molestation, Charles, duke of Burgundy, in the year 1472, obtained a solemn bull from pope Sixtus IV. ordering that the Cellites, or Lollards, should be ranked among the religious orders, and delivered from the jurisdiction of the bishops; and pope Julius II. granted them yet greater privileges in the year 1506. Mosheim informs us that many societies of this kind are still subsisting at Cologne, and in the cities of Flanders, though they have evidently departed from their ancient rules. Eccl. Hist. vol. iii. 8vo.

Lollard and his followers rejected the sacrifice of the mass, extreme unction, and penances for sin; arguing, that Christ's sufferings were sufficient. He is likewise said to have set aside baptism as a thing of no effect; and repentance, as not absolutely necessary, &c. In England, the followers of Wickliffe were called, by way of reproach, Lollards, from some affinity there was between some of their tenets; though others are of opinion, that the English Lollards came from Germany.

They were solemnly condemned by the archbishop of Canterbury and the council of Oxford.

LOLLCUNGE, in *Geography*, a town of Bengal; 20 miles E.N.E. of Purneah.

LOLLI, in *Biography*, a performer on the violin of great celebrity, who came into England at the beginning of 1785; but by a caprice in his conduct equal to his performance, he was seldom heard. And then so eccentric was his style of composition and execution, that he was regarded as a madman by most of his hearers. And yet we are convinced, that in his lucid intervals he was, in a serious style, a very great, expressive, and admirable performer. In his freaks nothing can be imagined so wild, difficult, grotesque, and even ridiculous as his compositions and performance. After playing at the oratorio, and making the grave and ignorant laugh at very serious difficulties upon which he had, perhaps, but ill bestowed his time, he suddenly left the kingdom, *à la fardine*; perhaps, at last, to shun difficulties of another kind.

LOLLIEI, in *Geography*, a town of Thibet; 110 miles N. of Goreah. N. lat. 35° 15'. E. long. 84° 28'.

LOLLONADO, a town of the island of Cuba; 140 miles S.W. of Havana.

LO-LOS, the name of a particular people dispersed through the province of Yun-nan, in China, distinct from the

the Chinese. They were formerly governed by their own sovereigns, but upon submitting to the emperor of China they obtained peculiar privileges. These people are well made, and inured to labour. They have a peculiar language of their own, and a mode of writing which seems to be the same with that of the bonzes of Pegu and Ava. These cunning priests have acquired an influence over the Lo-los in the western part of Yun-nan, and have introduced among them the worship and religious ceremonies of their country; and they have even induced them to build large temples of a different architecture from that of the Chinese. The princes of the Lo-los are absolute masters of their subjects, and have a right of punishing them, even by death, without waiting for the answer of the viceroy. These princes have many officers and men under their command; and their militia is composed of cavalry and infantry, who are armed with bows and lances, and sometimes muskets. The iron and copper mines which are lodged in their mountains, enable them to make their own armour. These mountains also abound with mines of gold and silver. The dress of the Lo-los consists of plain drawers; a vest of cotton hanging to their knees, and a straw hat; their legs are bare, and they wear only sandals. The women have a long robe, covering the whole body down to the feet, above which they tie a small cloak that reaches no further than the girdle. In this dress they appear on horseback, at marriage ceremonies, or when they pay visits, accompanied by the females in their train, who are also on horseback, and by several domestics. Grofier.

LOLPOUR, a town of Hindoostan, in the circar of Jyenagur; 15 miles S.S.E. of Jypour.

LQM, a town on the E. coast of the island of Gilolo. S. lat. 0° 16'. E. long. 128°.

LOMABLEM, or **LOMBLEM**, an island in the East Indian sea, about 120 miles in circumference. S. lat. 8° 18'. E. long. 123° 56'.

LOMATIA, in *Botany*, from *λμα*, a border, because the seeds are terminated by a bordered ring. Brown Tr. of Linn. Soc. v. 10. 199. Prodr. Nov. Holl. v. 1. 389. Ait. Hort. Kew. ed. 2. v. 1. 212.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Proteaceae*, Juss. Brown.

Gen. Ch. *Cal.* none. *Cor.* Petals four, irregular, distinct, oblong, obliquely twisted toward one side; their summits dilated, concave, bearing the stamens. Nectary three glands at one side of the base of the stalk supporting the germen. *Stam.* Filaments four, extremely short, in the hollows of the petals; anthers roundish, sunk in the said hollows. *Pist.* Germen superior, stalked, half-ovate, erect; style permanent, incurved; stigma oblique, dilated, roundish, nearly flat. *Peric.* Follicle stalked, half-ovate, coriaceous, crowned with the style of one cell. *Seeds* many, imbricated in two rows, elliptical, compressed, with a terminal bordered wing, whose disk is without veins.

Eff. Ch. Petals four, irregular. Stamens sunk in the cavities of the limb. Three glands, on one side, at the base of the stalk of the germen. Stigma oblique, flattish. Follicle coriaceous, of one cell. Seeds many, with a terminal bordered wing.

Eight species of this genus, some found in New Holland, others in South America, are defined by Mr. Brown. They are "shrubs, with alternate leaves, which are in many cases divided or toothed, rarely entire, sometimes various on the same individual plant. Clusters terminal, sometimes axillary, elongated, loose, occasionally short and corymbose; their partial stalks in pairs, with one common bractea to each pair. Flowers yellowish-white. Involucrum none. Nucleus

of the seed besprinkled with sulphur-coloured powder." Brown.

1. *L. filifolia*. Cut-leaved Lomatia. Sims in Curt. Mag. t. 1272. (*Embothrium filifolium*; Sm. Bot. of New Holl. 23. t. 8. *E. herbaceum*; Cavan. Ic. v. 4. 58. t. 384.)—Leaves doubly pinnatifid, very smooth; segments linear-wedge-shaped, or lanceolate, acute, pointed, reticulated with veins. Clusters very smooth, elongated, simple or divided.—Native of light sandy fields and heaths, on the east coast of New Holland, near Port Jackson. It is said to have been sent to Kew garden, by sir Joseph Banks, in 1792. We first saw it in flower at Messrs. Greenwood's, Kensington, in the summer of 1793, where it was kept in the stove; but the shelter of a greenhouse is sufficient. It is propagated either by seeds or layers. The whole plant is very rigid and smooth, three or four feet high, but little branched. Leaves dark green, with various, more or less compound, decurrent segments, much resembling some of the umbelliferous tribe. Flowers white, inodorous, in long, terminal clusters, whose stalks have occasionally a reddish tinge. Fruit about an inch long. Every part turns quite black in drying. See *EMBOTHRIUM*.

2. *L. tinctoria*. Colouring Lomatia. Labill. Nov. Holl. v. 1. 31. t. 42, 43.—Leaves once or twice pinnatifid, or undivided, smooth; segments pectinate, single-ribbed, almost veinless, bluntish, pointed. Clusters elongated, smooth, unbranched.—Gathered by Labillardiere and Brown in hilly places and fields at Van Diemen's land. The stem is six feet high. Leaves very various, usually very neatly pinnatifid, with numerous, parallel, linear-lanceolate, sometimes subdivided, segments; more rarely undivided, slightly notched at the tip. Clusters loose, with fewer flowers, on longer stalks than the former. The sulphur-coloured powder which covers the seeds, is said by Labillardiere to give out a rose-coloured dye to water.

3. *L. ferruginea*. Rusty Lomatia. (*Embothrium ferrugineum*; Cavan. Ic. v. 4. 59. t. 385.)—Leaves doubly pinnatifid, downy; segments ovate or lanceolate. Clusters shorter than the leaves.—Gathered by Louis Née at St. Carlos de Chiloe, South America, in places occasionally overflowed by the sea, flowering in February. The stem is ten or twelve feet high, rarely straight; its branches downy. Leaves doubly pinnatifid, acute; the down of the young ones rusty, of the old ones grey. Petals red within; yellowish-green without.

4. *L. polymorpha*. Various-leaved Lomatia.—Leaves linear-lanceolate; entire, toothed, or pinnatifid; downy, like the branches and flower-stalks, beneath. Clusters corymbose, terminal. Corolla somewhat hairy. Pith very smooth.—Gathered on the southern hills of Van Diemen's land, by Mr. Brown, who conceives this species to have been confounded by Labillardiere under our second, when he says "the leaves of that are sometimes besprinkled at their back with short russet down." Two varieties of *L. polymorpha* are indicated; one whose leaves are undivided, their downiness grey, and their seed-vessels but half an inch long; the other with generally cut or pinnatifid leaves, rusty underneath, and their seed-vessels near an inch in length.

5. *L. ilicifolia*. Hlex-leaved Lomatia.—"Leaves oblong-ovate, acute, with fine spinous teeth, reticulated, quite smooth, as well as their footstalks. Clusters elongated, terminal."—Native of barren fields at the sides of hills on the southern coast of New Holland, near port Phillip, where Mr. Brown gathered it, after the flowers were fallen.

6. *L. longifolia*. Long-leaved Lomatia. (*Embothrium myricoides*; Gærtn. v. 3. 215. t. 218? Br.)—Leaves li-

near-lanceolate, elongated, smooth, distantly serrated. Clusters axillary. Flower-stalks and corolla rather hairy. Petal very smooth.—Gathered by Mr. David Burton, as well as Mr. Brown, on the stony banks of rivers and rivulets near Port Jackson. This is a branched bushy *shrub*, with angular young *branches*, clothed with rusty hairs, as are also the *flower-stalks*, *bracts*, and in some degree the *flowers*. The *leaves* are numerous, alternate, on short broadish stalks, lanceolate, acute, veiny, three or four inches long, about half an inch broad, smooth except the lower portion of their rib at the upper side; sharply and distantly serrated upwards, tapering and mostly entire in their lower half. *Clusters* axillary, solitary, simple or branched, about as long as the leaves. *Stigma* very broad, with a small point. *Follicle* smooth, above an inch long, semi-ovate.

7. *L. dentata*. Toothed Lomatia. (*Embothrium dentatum*; Fl. Peruv. et Chil. v. 1. 62. t. 94. a. Br.)—Leaves oval, with tooth-like serratures, smooth, as well as their foot-stalks. Clusters lateral, short. Corolla hairy. Germen downy.—Native of woods and groves in Chili.

8. *L. obliqua*. Oblique Lomatia. (*Embothrium obliquum*; Fl. Peruv. et Chil. v. 63. t. 97. B. hirsutum; Lamarck Dict. v. 2. 355.)—Leaves ovate, serrated, smooth. Clusters axillary. Flower-stalks and corolla hairy. Stigma deciduous.—Found on hills in the provinces of the Concepcion of Chili and Puchacay.

Mr. Brown mentions that the wings of the seed in these two last species, which have not been seen by him, require examination.

LOMAZY, in *Geography*, a town of Lithuania, in the palatinate of Brzesc; 36 miles S.S.W. of Brzesc.

LOMAZZO, GIOVANNI PAOLO, in *Biography*, an historical painter, born at Milan in 1538, and pupil of Gio. Battista Cerva. Before he became blind, which happened about the 33d year of his age, he painted much, with more whim than originality. He afterwards wrote several treatises on painting, in which, with the most tedious prolixity, he interweaves anecdote and useful precept, with chemic and astrologic nonsense. Fuseli's Pilkington.

LOMBARD, PETER, a bishop of Paris, who flourished in the twelfth century, and known under the title of "Master of the Sentences," was a native of Novara in Lombardy, from which he derived his surname. He received his education at Bologna, celebrated at that time for its university, and its very eminent professors of the civil law. His mind was bent on theological pursuits, and he was encouraged to devote himself to them by the bishop of Lucca, who recommended him to St. Bernard, by whose assistance he was enabled to prosecute his studies at Rheims. He afterwards removed to Paris, and from his reputation for learning, obtained a professorship in the university, and was presented with the canonry of Chartres, which was followed by his elevation to the episcopal dignity, for which he was indebted to the regard entertained for him by his pupil, Philip, son of Lewis le Gros. This prince was educated for the church, and in 1159 was elected bishop, an honour which he declined in favour of his old master, as a mark of personal regard for him. Lombard did not long enjoy the dignity; he died in the year 1164. His celebrity in the schools was derived from his work entitled "Sententiarum, lib. iv." in which he endeavoured to illustrate the doctrines of the church by a collection of sentences and passages drawn from the fathers whose contradictions he attempted to reconcile. This work was received with universal applause, and acquired so high an authority among the schoolmen, that the most learned doctors were employed in illustrating and expounding it. The abbé Fleury makes

the number of commentators on it amount to two hundred and forty-four. It was first printed at Venice in 1477, and has undergone a multitude of impressions at different times and in different places. Moreri.

LOMBARDS, or rather LANGOBARDS, which was their original name, deduced from the peculiar length and fashion of their beards, *lang* signifying *long*, and *baert*, *beard*, whereas the corrupt appellation of *Lombards* was diffused in the 13th century by the merchants and bankers, who were the Italian posterity of the savage warriors to whom the name originally belonged, denote a tribe of people who arose from an obscure and small beginning to occupy the most considerable rank in Europe. The Scandinavian origin of these people is maintained by Paul the Deacon, contended by Cluverius, and defended by Grotius. It would be tedious, and also unsatisfactory to the reader, if we were to make an attempt at pursuing the migrations of the Lombards through unknown regions and marvellous adventures. About the time of Augustus and Trajan these fierce people were discovered between the Elbe and the Oder. They were fierce beyond the example of the Germans, and they took pleasure in propagating the tremendous belief, that their heads were formed like the heads of dogs, and that they drank the blood of their enemies whom they vanquished in battle. From the north they gradually descended towards the south and the Danube; and after an interval of 400 years, they again appear with their ancient valour and renown. Their manners were not less ferocious. The assassination of a royal guest was executed in the presence, and by the command, of the king's daughter, who had been provoked by some words of insult, and disappointed by his diminutive stature. The victories of the Lombards recommended them to the friendship of the emperors; and at the solicitation of Justinian, they passed the Danube, to reduce, according to their treaty, the cities of Noricum and the fortresses of Pannonia. But urged onward by a spirit of rapine, they wandered along the coasts of the Adriatic as far as the Dyrrachium, and presumed, as the historian says, with familiar rudeness, to enter the towns and houses of their Roman allies, and to seize the captives who had escaped from their audacious hands. These acts of hostility, charged upon some loose adventurers, were disowned by the nation, and excused by the emperor: but the arms of the Lombards were more seriously engaged by a contest of 30 years, which was terminated only by the extirpation of the Gepide. Of the cause and event of the quarrel between the Lombards and the Gepide we have already given an account under the biographical article *Alboin*. In consequence of the victory gained by the Lombards, assisted by the Avari, a Scythian horde, over the Gepide, A.D. 566, no further obstacle could impede the progress of the confederates, and they faithfully executed the terms of their agreement. Having captured Milan, the capital of Liguria, the Lombards, with joyful acclamations, proclaimed and installed Alboin king of Italy; raising him upon a shield in the midst of the army according to the custom of their nation, and presenting him with a lance, which among them was the ensign of royalty. From this time, A.D. 570, historians date the beginning of the kingdom of Lombards in Italy, which lasted above 200 years. After this event he extended his conquests, and his progress was rapid in the reduction of the greatest part of Italy. Pavia held out for more than three years; but it was at length constrained to surrender to the arms of Alboin; and as it was a city of great strength, and conveniently situated, this sovereign and his successors chose it for the place of their residence; and thus it became the metropolis of the kingdom of the Lombards. After his death (see *ALBOIN*,) Clepho, one of the noblest Lombard

LOMBARDS.

Lombard chiefs, was unanimously elected as his successor: his reign was terminated before the expiration of eighteen months by the hand of an assassin, and during the minority of his son Autharis, Italy was divided and oppressed by a ducal aristocracy of 30 tyrants. After an interval of distraction, which lasted 10 years, Autharis attained the strength and reputation of a warrior. Under the standard of their new king, the conquerors of Italy withstood their successive invasions; and the victorious Autharis asserted his claim to the dominion of Italy. However, he allowed the dukes, who for 10 years had exercised absolute authority in their respective dukedoms, to continue in their governments; but he obliged them to contribute one moiety of their revenue to the maintenance and support of his royal dignity. He also bound them, by an oath, to assist him in time of war to the utmost of their power. As he did not deprive them of their dukedoms, except in cases of treason, he did not transfer them to others, but when their male issue failed: and this was the origin of fiefs in Italy. Some, indeed, have imagined that fiefs were first introduced by the Lombards, and from them adopted by other nations. But it appears, that fiefs had been introduced into Gaul by the Franks some years before the reign of Autharis, who first established them in Italy. All the customs and laws which were afterwards introduced and published concerning fiefs, are owing to the Lombards, who gave them a certain and regular form; so that, among all other nations, successions, acquisitions, inheritances, and every thing else relating to fiefs, were regulated by the customs and laws of the Lombards. Hereupon a new body of laws sprung up, which were called feudal laws, and which continued in some provinces of Italy, and particularly in the kingdom of Naples, to be the chief part of the jurisprudence.

Autharis, having settled matters with the dukes in the manner now mentioned, enacted several reasonable and salutary laws against theft, rapine, murder, adultery, and other crimes which at that time prevailed among his subjects. He was also the first of the Lombard kings, who, renouncing Paganism, embraced the Christian religion, and his example was followed by most of his subjects.

At the foot of the Rhatian Alps, Autharis subdued the resistance, and rifled the hidden treasures of a secluded island in the lake of Comum; and at the extreme point of Calabria, he touched with his spear a column on the sea-shore of Rhegium, proclaiming that a certain landmark to stand the immovable boundary of his kingdom. Autharis closed his life and reign at Pavia, A.D. 590. Agilulf, his successor, renounced the opinions of Arius, which had been countenanced by Autharis, and embraced the Catholic faith. Agilulf was succeeded A.D. 615, by his son Adalund, who being deposed, had for his successor Ariovald, under whose government the Lombards enjoyed tranquillity both at home and abroad. Upon his death, A.D. 636, Rotharis ascended the throne, who is the first who gave written laws to the Lombards. From the year 638 to the reign of Luitprand, no acts of hostility occurred between the exarchs and the kings of the Lombards: the latter being satisfied with their new conquests, and the former being glad to enjoy unmolested the territories that remained under the dominion of the emperor. Luitprand, who ascended the throne A.D. 711, may be accounted, next to Rotharis, the chief law-giver of the Lombards: but induced by ambition he undertook to drive the Romans out of Italy, and this enterprise occasioned the ruin of the kingdom of the Lombards in that country. Luitprand invaded the exarchate, and reduced Ravenna, and several other cities of the exarchate, which he formed into a dukedom. Ravenna was af-

terwards recovered by the exarchate: but taken again by Astulphus, who changed it into a dukedom. The popes had been alarmed, and made application to Pepin, king of France, for assistance and protection. Accordingly Pepin was persuaded to make war upon the Lombards: and, in the year 754, entered Italy, and besieged Astulphus in his metropolis. Rome was twice rescued from the attacks of the Lombards, A.D. 754. At length the passes of the Alps, and the walls of Pavia, were their only defence: the former were surprised, and the latter were invested by Charlemagne, the son of Pepin; and after a blockade of two years, Desiderius, the last of their native princes, surrendered his sceptre and his capital, A.D. 774. Thus ended the kingdom of the Lombards in Italy, after they had possessed that country for 206 years. Under the dominion of a foreign king, but in the possession of their national laws, the Lombards became the brethren, rather than the subjects, of the Franks; who derived their blood, and manners and language, from the same Germanic origin. *Anc. Univ. Hist.* vol. 7. Gibbon.

During a period of 200 years Italy was unequally divided between the kingdom of the Lombards and the exarchate of Ravenna. (See EXARCH.) From Pavia the royal seat, the kingdom of the Lombards was extended to the maritime coast, and the west, as far as the confines of the Avarian, Slavonian, and the Franks of Aultraia and Burgundy. In the language of modern geography it is now represented by the Terra firma of the Venetian republic, Tyrol, the Milanese, Piedmont, the coast of Genoa, Mantua, Parma, and Modena, the grand duchy of Tuscany, and a large portion of the ecclesiastical state from Perugia to the Adriatic. The dukes, and at length the princes of Beneventum, survived the monarchy and propagated the name of the Lombards. From Capua to Tarentum, they reigned near 500 years over the greatest part of the present kingdom of Naples. In process of time, the disposition and manners of the Lombards underwent a very important change. So rapid, indeed, was the influence of climate and example, that the Lombards of the fourth generation surveyed with curiosity and affright the portraits of their savage forefathers. The government of the Lombards was an elective monarchy: and the public revenues arose from the produce of land and the profits of justice. The Lombards were at first a cruel and barbarous people; but divesting themselves, by degrees, of their native ferocity and barbarity, especially after they had embraced the Christian religion, they governed with such equity and mildness, that most other nations envied the happiness of those who lived under their administration.

As they had no other kingdom, nor dominions, Italy became their own country; whence the natives esteemed their kings as their natural princes, not thinking themselves governed, much less kept in slavery, by a foreign nation, as it happened to them afterwards, when, by frequent changes, they groined under the heavy yoke, sometimes of one nation, and sometimes of another. Under the government of the Lombards, says Paulus Diaconus, no violence was committed, no one unjustly dispossessed of his property, none oppressed with taxes; theft, robberies, murder, and adultery, were seldom heard of: every one went, without the least apprehension of danger, whither he pleased: and indeed their many wholesome laws, restraining and severely punishing all sorts of crimes; the magnificent churches, and rich monasteries, with which they filled that part of Italy which was subject to them; the many bishoprics which they erected; the towns and cities which they either built, or repaired, in most provinces of Italy; their generosity even to the bishop of Rome, their avowed enemy: and,

finally, the great number of persons among them, whose sanctity and eminent virtues have been acknowledged by the popes themselves, must convince every impartial reader, that the Lombards were not such a savage, barbarous, and inhuman nation, as they are described by some of the popes, especially by Adrian, the chief author of the ruin of their kingdom. They were the only power in Italy capable of defeating the ambitious views of the bishops of Rome, whom they would not suffer to enrich themselves with the spoils of the emperors, but considered them as their own by right of conquest; and hence arose the inveterate hatred which the popes bore them, and could not help betraying in all their writings. But their laws are convincing proofs of their justice, humanity, and wisdom, and, at the same time, a full confutation of the many calumnies, with which the popes, and their partisans, have endeavoured to asperse them. Their laws were found so just and equitable, that they were retained in Italy, and observed some ages after their kingdom was at an end.

LOMBARDS, a name given in the Netherlands, France, and England, to lending-houses. (See *LOAN-banks*.) It is well known that in the thirteenth and following centuries many opulent merchants of Italy, which at those periods was almost the only part of Europe that carried on an extensive trade, were invited to their countries, where there were few mercantile people able to engage deeply in commerce. For this reason they were favoured by governments in most of the large cities; but in the course of time they became objects of universal hatred, because they exercised the most oppressive usury, by lending at interest and on pledges. They were called *Longobardi* or *Lombardi*, as whole nations are often named after a part of their country, in the same manner as all the Helvetians are called Swiss, and the Russians sometimes Moscovites. They were, however, called frequently also Caorini, Catureini, Caurisini, Cawarini, Cawartini, Bardi, and Amanati; names which, in all probability, arose from some of their greatest houses or banks. We know, at any rate, that about those periods the family of the Corsini were in great consideration at Florence. They had banks in the principal towns for lending money; they demanded exorbitant interest; and they received pledges at a low value, and retained them as their own property if not redeemed at the stated time. They eluded the prohibition of the church against interest when they found it necessary, by causing the interest to be previously paid as a present or premium; and it appears that some sovereigns borrowed money from them on these conditions. In this manner did Edward III., king of England, when travelling through France, in the year 1329, receive 5000 marks from the bank of the Bardi, and give them in return, by way of acknowledgment, a bond for 7000. When complaints against the usurious practices of these Christian Jews became too loud to be disregarded, they were threatened with expulsion from the country, and those who had rendered themselves most obnoxious on that account, were often banished, so that those who remained were obliged to conduct their employment with more prudence and moderation. It is probable that the commerce of these countries was then in too infant a state to dispense altogether with the assistance of these foreigners. In this manner were they treated by Louis IX. in 1268, and likewise by Philip the Bold; and sometimes the popes, who would not authorise interest, lent their assistance by prohibitions, as was the case in regard to Henry III. of England in 1240.

In the fourteenth century, the Lombards, in the Netherlands, paid to government rent for the houses in which they carried on their money transactions, and something besides

for a permission. Of this we have instances at Delft in 1313, and at Dordrecht in 1342. As in the course of time the original Lombards became extinct, these houses were let, with the same permission, for the like employment; but governments at length fixed the rate of interest which they ought to receive, and established regulations for them, by which usurious practices were restrained. Of leases granted on such conditions, an instance occurs at Delft in the year 1655. In 1578, William prince of Orange recommended to the magistrates of Amsterdam Francis Masafia, one of the Lombards, as they were then called, in order that he might obtain for him permission to establish a lending-house; as many obtained permission to keep billiard-tables, and Jews letters of protection. In the year 1611, the proprietor of such a house at Amsterdam, who in the latter years of his lease had gained by his capital at least thirty-three and a half per cent. offered a very large sum for a renewal of his permission; but, in 1614, the city resolved to take the lombard or lending-house into their own hands, or to establish one of the same kind. However detailed this plan might be, a dispute arose respecting the legality of it, which Murets and Claude Saumaise endeavoured to support. The public lending-house or lombard at Brussels was established in 1619; that at Antwerp in 1620, and that at Ghent in 1622. All these were established by the archduke Albert, when he entered on the governorship, with the advice of the archbishop of Mechlin; and on this occasion the architect Wenceslaus Coberger was employed, and appointed inspector-general of all the lending-houses in the Spanish Netherlands. Some Italians assert, that the Flemings were the first people who borrowed money on interest for their lending-houses; and they tell us that this practice began in the year 1619. We are assured also, that, after long deliberation at Brussels, it was at length resolved to receive money on interest at the lending-houses. It however appears certain, that in Italy this was never done, or at least not done till a late period, and that the capitals of the lending-houses there were amassed without giving interest.

This beneficial institution was always opposed in France; chiefly, because the doctors of the Sorbonne could not divest themselves of the prejudice against interest; and some in modern times who undertook there to accommodate people with money on the like terms, were punished by government. A lending-house, however, was established at Paris, under Louis XIII. in 1626; but the managers next year were obliged to abandon it. In 1695, some persons formed a capital at Marseilles for the purpose of establishing one there according to the plan of those in Italy. The *mont de piété* at Paris, which has had sometimes in its possession forty casks filled with gold watches that have been pledged, was, by royal command, first established in 1777. Beckmann's *Hist. of Inventions*, vol. iii.

LOMBARDY, in *Geography*, a country in the northern part of Italy, very much corresponding with the Cisalpine Gaul of the Romans. It derived its name from the Lombards, (see the article *LOMBARDS*.) who founded the kingdom in the middle of the sixth century. This country was divided into several states, subject to the house of Austria, the republic of Venice, and the king of Sardinia; such as the duchies of Milan and Mantua, called Austrian Lombardy; the Paduan, Veronese, Vicentin, Brescian, Comasco, Bergamasco, belonging to Venice;—Monferrat and Nice, annexed to Piedmont, subject to the king of Sardinia;—together with many others, as the duchies of Modena, Reggio, Parma, Piacenza, Mirandola, and several smaller principalities and states. The vicissitudes which Lombardy has undergone, and more especially those which have occurred

to it since the French revolution, are briefly detailed under *Cisalpine Republic*, and *ITALY*. See likewise each of the above enumerated articles.

LOMBES, a town of France, and principal place of a district in the department of the Gers, the see of a bishop before the revolution; 16 miles S.E. of Auch. The place contains 1443, and the canton 12,145 inhabitants, on a territory of 290 kilometres, in 39 communes.

LOMBOK, an island in the East Indian sea, about 40 miles from N. to S. and from 18 to 30 broad, chiefly inhabited by Gentoos; between which and Cumbava is a passage, called the "Straits of Lombok."—Also, a town on the E. coast of the same island. S. lat. 8° 42'. E. long. 116° 2'.

LOMBUZZKOL, a small island in the Frozen ocean; near the coast of Russia; 180 miles E. of Kola. N. lat. 67° 55'. E. long. 40° 14'.

LOMBY, a town of Hindoostan, in the Carnatic; 20 miles N.W. of Tiagar.

LOMEIR, JOHN, in *Biography*, a learned Dutch Protestant divine, pastor of the church of Dotekum in Zutphen, was author of a curious little work abounding in erudition and deep research, in which he has undertaken to give historical and critical notices of the most celebrated libraries in ancient and modern times. It is entitled "*De Bibliothecis Liber Singularis*;" 12mo. The author's plan gave rise to a larger work on the same subject, by Maderus, a learned German, who published at Helmstadt a treatise "*De Bibliothecis*," in two vols. 4to., in which he has inserted Lomeir's piece.

LOMENTACEÆ, in *Botany, a natural order of plants, the 33d among the *Fragmenta* of Linnæus, named, as it should seem, from *lomentum*, the meal of beans, in allusion to the pulse-like nature of the plants in question, so as to keep in view their analogy with the *Papilionaceæ*. They are included in the three first sections of Jussieu's *Leguminosæ*, or nearly so; see that article. *Polygala* indeed, placed here by Linnæus, is referred by Jussieu to the *Pedicularis*.*

LOMENTUM, a word used by the old writers on medicine to express a meal made of beans, or bread made of this meal, and used as a wash. See *DETERSORIUM*.

Others have applied it to the French chalk, or morochthus, used by the sewers of clothes, which is brought over in large cakes, resembling loaves or cakes of bread.

LOMGRAD, in *Geography*, a town of Bulgaria, at the conflux of the river Lom with the Danube; 20 miles S.S.E. of Viddin.

LOMI, a town of Russia, in the government of Irkutsk, on the Amur; 16 miles N. of Stretensk.

LOMMETSCH, or **LUMTSCH**, a town of Saxony, in the margravate of Meissen; seven miles N.W. of Meissen. N. lat. 51° 11'. E. long. 13° 13'.

LOMMIUS, JONOCUS, (VAN LOM, in his native language,) in *Biography*, a medical writer of reputation, was born at Beren, in Guelderland, about the commencement of the sixteenth century. His father, who was town-clerk of that place, took great care of his education. He was already well versed in the Latin and Greek languages, when he turned his attention to medicine, which he studied principally at Paris, where his talents and assiduity obtained him the friendship of Fernel. It is not known where he took his degree; but he practised for a considerable time at Tournaï, to which city he was pensionary-physician in 1557; and he removed to Brussels, at an advanced period of life, about the year 1560. He was living in this city in 1562,

beyond which period there is no record of him. He left three small works, which are still held in estimation in consequence of the purity and elegance of the Latin in which they are written: these are "*Commentarii de Sanitate tuenda in primum librum C. Celsi*," Louvain, 1558, 12mo. This is an ample commentary upon Celsus, taken entirely from the ancients. "*Observationum Medicinarum Libri tres*," Antwerp, 1560. This work has passed through many editions: it consists of histories of disease, related with the simple perspicuity of Celsus, and containing many useful and valuable observations on the diagnostics, prognostics, and cure. "*De curandis Febris continuis Liber*," Antwerp, 1563. This little treatise, like the foregoing, has been several times printed and translated. These works were published together at Amsterdam, in 1745, in three vols. 12mo., under the title of "*Opera omnia*," Eloy Did. Hist.

LOMNITZ, in *Geography*, a town of Bohemia, in the circle of Königgrätz; six miles N. of Gitschin.—Also, a town of Moravia, in the circle of Brunn; 15 miles N.N.W. of Brunn. N. lat. 49° 24'. E. long. 16° 18'.

LOMNITZ Peak. See *CARPATHIAN Mountains*.

LOMOND, **LOCH**, a lake situated in the county of Dunbarton, Scotland. It is the finest and most beautiful expanse of water in that country, and not surpassed, in variety and magnificence of scenery, by any in Great Britain. This lake extends about twenty-six miles in length from north to south, and varies from one to eight miles in breadth. The broadest portion is towards the south. As it approaches the north, it gradually contracts. Here it is much deeper than in the broader parts. At the foot of Benlodon the depth is about 120 fathoms, but in the south division it is not generally much above 14 fathoms. The northern and deeper part of this lake is never covered with ice even in the severest frosts, but south from Luss, it is often frozen over so completely, that not only men but loaded horses can pass over it to the different islands in perfect safety.

Loch Lomond is supplied with water from several rivers, besides smaller streams from the mountains. It has, however, but one way of discharging itself, and this is the reason why it swells in wet seasons even so high as six feet above its usual level. Fish are caught here in great abundance, particularly salmon trout, eels, and perch, as likewise a species called pollocks, which resemble in appearance and flavour the large herrings.

The beauties of this lake have often been the subject of description, both in poetry and prose. These seem chiefly to arise from the woods in its vicinity, the number and variety of its islands, and the near approach of the terrific Grampians, which afford a striking contrast to the more placid scenery immediately adjacent. At the house of Cameron, placed at the southern extremity of the lake, the whole charms of this delightful expanse are in full view. After passing this mansion, the road skirts along the western bank, sometimes losing itself among the natural foliage that clothes the brow of the mountains, and at other times emerging into a more free space; thereby presenting in succession a variety of views of the lake, islands, and neighbourhood, highly captivating and delightful.

The islands in Loch Lomond, small and great, are usually reckoned to be thirty in number. Most of them are finely wooded, but not above ten are of any considerable size. The principal ones are the property of the duke of Montrose and sir James Colquhoun of Luss. Inchcailloch, or the island of old women, so called from a nunnery formerly there, was at one time the site of the church of Bueloch.

in Stirlingshire. Inchmurin is the most valuable island in the lake, and has a deer park belonging to the duke of Montrose. The island of Inch-tavanach, *i. e.* the island of the monk's-house, derives its name from the circumstance of a monk having fixed his residence here at a very remote period. The other islands are not deserving of particular notice, except as all contributing, by the beauty of their verdure, to render the whole scenery more interesting and varied than it otherwise would be.

Loch Lomond has long been celebrated for three wonders, "fish without fins, waves without wind, and a floating island." The fish without fins are manifestly vipers, which abound here in great plenty, and sometimes twin from one island to another. Waves without wind are common to this lake, with all extensive deep waters, when a calm immediately succeeds a storm. The floating island is now fixed near the west shore of the isle of Incheonagan, and if it ever did float, must be considered as a mossy fragment bound together by the matted roots of coarse grasses, willows, Dutch myrtles, &c.

The waters of this lake are supposed to be rising in height. Across the channel of a stream called Falloch, at the northern extremity, there are a number of stones fixed regularly, and evidently intended for enabling passengers to cross from one side to the other, which are now however covered with at least five feet of water. Near the middle of the bay of Camstraddan, when the water is low, there is a heap of stones visible, which is said to have formerly composed the residence of the Colquhouns of Camstraddan. Camden, in his *Atlas Britannica*, mentions an island existing here in his day, with a house and garden upon it. About five miles to the south of this heap of stones there is another, said to be the ruins of an ancient church: the field opposite to it is still called Church-field.

The village of Luss is delightfully seated on the western bank of the lake, and on the post road from Glasgow to Inverary. In the immediate vicinity of this village, Rosedoe, the mansion house of Sir James Colquhoun of Luss, is placed on a rich peninsula, projecting so far into the lake as to appear insulated. The ground is finely wooded, and a tower of the ancient castle, or habitation of the family, forms an excellent contrast to the modern house. Some very bold and rugged mountains compose the back ground of this charming scenery. Between Luss and Tarbet the road diminishes in breadth very rapidly. Passing the water of Uglas, which discharges itself into the lake, it ascends a lofty promontory, projecting considerably in the lake, which is called the point of Firkin. The ascent to the summit of this eminence is abrupt, difficult, and tedious, but the view which displays itself from it amply repays the admirer of nature for the labour attending it. Nearly opposite to this point Benlomond rears his lofty head on the eastern side. For a description of this mountain and its scenery, see the article BENLOMOND.

LOMOND Hills, two beautiful conical hills situated in the county of Fife, Scotland. The eastern one is by far the most beautiful, and rises 1650 feet above the level of the town of Falkland, which is placed at a short distance from its base. It appears to have been the seat of a fort in ancient times. On the very summit is a small lake, which has probably been the crater of an extinct volcano. On this hill a mine of lead has been lately opened with good prospects of success to the proprietors. It likewise contains coal and limestone in considerable abundance, but neither of them are wrought. The other hill, which is called Western Lomond, from its situation with respect to the former, is

much higher than it, and perhaps commands a more extensive view. On the top is one of those heaps or tumuli of stones which are denominated cairns.

LOMONOZOF, in *Biography*, accounted the father of Russian poetry, was born at Kolmogori in 1711, where his father was a dealer in fish. He possessed the rare advantage of persons in his station, of learning to read his native language, and caught a flame of poetical inspiration by perusing a translation of Solomon's song into rude verse. His love of learning induced him to leave his father, and take refuge in a monastery at Moscow, where he laid a good foundation in the learned languages, and displayed such talents, that he was sent by the Imperial Academy for improvement to the German university of Marburg. He studied under Wolf and the other celebrated professors. On his return to his native country he was elected adjunct, and then member of the Imperial Academy, and professor of chemistry, in which science he was a considerable adept, having studied it under Kunckel at Freyburg in Saxony. In 1764 he was honoured with the title of counsellor of state. He died in the same year. His reputation as a literary man is founded on his poetical compositions, which are numerous and various in their kinds. His odes are admired for their spirit and sublimity, in which he is said to rival Pindar. In these, and in his other poems, he was the creator of various measures new to Russian verse, so that he ranks as its greatest benefactor. He was author likewise of tragedies, idylls, and epistles, and he left a fragment of an epic poem on Peter the Great. He published some chemical and philosophical tracts, and two short pieces on the history of Russia, and he enriched the language of his country with some translations from the Greek and Latin.

LOMPAR, in *Geography*, a small island in the Baltic, near the S.E. coast of Åland. N. lat. 60° 10'. E. long. 20° 9'.

LOMWIA, in *Ornithology*, the name of a web-footed water-fowl common on the English shores, and called in different places the *guillem*, *guillemot*, *sea-hen*, *kidlaw*, and *skout*: the last name, however, is somewhat equivocal, as the Scotch call the common *razor-bill* by this name. See COLUMBUS TROLE.

LOMZA, in *Geography*, a town of the duchy of Warsaw, situated on the Narew; 80 miles N.E. of Warsaw. N. lat. 53°. E. long. 22° 40'.

LONAS, in *Botany*, Adans. Fam. v. 2. 118. Gærtn. v. 2. 396. t. 165, a genus established by those authors upon the *Achillea inodora*, Linn. Sp. Pl. 1265, *Athanasia annua*, Syst. Veg. ed. 14. 741.

LONATO, or LONADO, in *Geography*, a town of Italy, in the department of the Veneto; 12 miles E.S.E. of Brescia.

LONCHITIS, in *Botany*, a name derived from *λόνχη*, a spear, borrowed from the Greeks, and applied by Tournefort to what he esteemed a distinct genus of ferns, characterized by having auricled leaflets. Linnæus has retained it for one of the same family, better defined by the fructification, of which we are now to speak. The *λόνχη* of Dioscorides has always been a subject of dispute, though his description is more full and precise than usual. Some have thought it *Iris tuberosa*, others *Serapias Lingua*. His *λόνχη* however does appear to be a fern.—Linn. Gen. 560. Schreb. 757. Mart. Mill. Dict. v. 3. Sm. Mem. de l'Acad. de Turin. v. 5. 413. Tracts 244. Swartz. Syn. Fil. 93. Sprengel. Crypt. 127. t. 4. f. 27. Juss. 15. Lamarck Illustr. t. 868.—Class and order, *Cryptogamia Filices*. Nat. Ord. *Filices*, Linn. Juss.

Gen.

Gen. Ch. *Capsules* annulated, numerous, assembled in crescent-shaped, short, when young often divided, lines, in the margin of each sinus of the leaves. *Involucrum* membranous, proceeding from the margin of the leaf, inflexed, often divided in the middle.

Eff. Ch. Fructification in crescent-shaped spots, in the sinuses of the leaves. *Involucrum* from the inflexed margin of the leaf, separating inwards.

1. *L. aurita*. Linn. Sp. Pl. 1536. (*Filix latifolia*, spinulis mollibus et nigris aculeata; Plum. Fil. 14. t. 17. Petiv. Fil. t. 4. f. 4.—Frond pinnate; pinnatifid; the lower pair of leaflets divided; lobes obtuse, smooth, wavy, toothed at the summit. Stalk prickly.—This species, which Plumier only appears to have seen, was gathered by him in the course of a valley, in a district of Martinico, commonly called *le Prescheur*. The root consists of numerous, black, entangled fibres. *Fronde* five or six, erect, about a foot and a half high; their stalks brownish, polished, clothed with numerous, horizontal, black, plant prickles. The upper half of the plant consists of a few nearly opposite pairs of long and broadish, pinnatifid, pointed leaves, or *pinnae*, very thin, membranous, smooth, delicate, and finely veined, of a bright green. Their segments are separated rather more than half way to the rib, broadish, wavy at the edges, toothed at their blunt apex, and bearing at their sinuses, between each other, a crescent-shaped thick mass of *fructification*, which seems not to be cloven or divided.

2. *L. hirsuta*. Linn. Sp. Pl. 1536. (*Filix villosa*, pinulis quercinis; Plum. Fil. 16. t. 20. Petiv. Fil. t. 4. f. 5.)—Frond hairy, doubly pinnate; deeply pinnatifid; lobes sinuated, obtuse, wavy, many-flowered.—Gathered by Plumier by rivers in Martinico; by R. Shakespear in Jamaica. We have also specimens from J. V. Thompson, esq. collected by him in some part of the West Indies; yet this species is very rare. It differs widely from the former in its hairiness and much greater size, being five or six feet high, and the stalks near an inch thick. The frond moreover is doubly pinnate, either in an alternate or opposite manner; its leaves very deeply pinnatifid, pointed, their obtuse segments also pinnatifid, or at least deeply sinuated, each sinus bearing a crescent-shaped mass of seeds, or rather two separate masses, each with its own roundish *involucrum*, most unlike that of an *Adiantum*, though they finally, for the most part, coalesce.

3. *L. javanica*. Lamarck Dict. v. 3. 594. Swartz Syn. Fil. 94.—Frond hairy, once or twice pinnate; deeply pinnatifid; lobes sinuated, pointed, crenate, many-flowered. *Involucrum* simple.—Gathered by Commerçon in Java, according to Lamarck, though the specimen given to the younger Linnæus by Thouin is marked as coming from the Mauritius. It seems at any rate to be of East, not West, Indian origin, and differs essentially from the foregoing. How often the frond is decomposed, we have not materials to determine. Our specimen has two opposite *pinnae* only, each above a foot long, pointed, very deeply pinnatifid, clothed with fine soft pubescence, beautifully reticulated with veins; dark-green above, brighter beneath. The segments are likewise sharp-pointed, about fifteen pair, deeply sinuated, crenate. One thick, brown, semilunar mass of *fructification*, stands in each sinus, and is, as far as we can discern, simple and undivided, as well as its *involucrum*.

4. *L. glabra*. Swartz. n. 3. Bory de St. Vincent Voy. v. 1. 321.—“Frond doubly compound, smooth; leaves somewhat pinnate; their divisions deeply crenate.”—Native of the isle de Bourbon. We know nothing of this species

but the above character, which, except as to smoothness, gives no very precise information.

5. *L. repens*. Linn. Sp. Pl. 1536. (*Filix aculeata repens*; Plum. Fil. 11. t. 12. Petiv. Fil. t. 4. f. 6.)—Frond thrice pinnate; leaves deeply pinnatifid; lobes sinuated, obtuse, crenate. Stalks prickly. Root creeping.—Gathered by Plumier in Martinico. He described the root as extremely long, creeping like couchgrasses, half the thickness of the finger, black both within and without. *Fronde* spreading horizontally and very widely. Their general and partial stalks prickly, twice pinnate, in an alternate order. *Leaves* about six inches long, pointed, very deeply pinnatifid, if not pinnate; their segments oblong, obtuse, deeply sinuated. *Fructification* small, apparently solitary in each sinus. We know not on what grounds Linnæus fixed the genus of this species, which no other botanist than Plumier appears to have seen. As far as his figure goes, it may belong to *Dicksonia*, or *Cyathea*, as probably as to *Lonchitis*.

The *L. pedata* of Linnæus, Sp. Pl. 1536, like a few others named or published by different botanists, belong rather to *Pteris*, betwixt which genus and the present, it is not always easy to draw a line.

LONCHIURUS, in *Natural History*, a genus of fishes of the order thoracici: pectoral fins separate; tail lanceolate. There is only one species, viz. the *barbatus*, brown, with two cirri under the chin, which is about ten inches long, and inhabits the rivers of Surinam.

LONDINIARES, in *Geography*, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Neufchâtel; 7 miles N. of Neufchâtel. The place contains 764, and the canton 5691 inhabitants, on a territory of 225 kilometres in 32 communes.

LONDON, the metropolis of the British empire, the most wealthy, most extensive, and probably the most populous and powerful city in the world, is seated in a fertile and salubrious plain or valley, on the banks of the river Thames, which divides the town into two irregular parts, and passes through it, from the west to the east, in its progress to the sea. Many cities and towns of antiquity have been famous in the annals of nations: Nineveh was noted for its towers and walls of vast circumference, height, and breadth; Babylon, for the hanging gardens, and other objects of human labour; Persepolis, for its natural fortifications; Palmyra and Balbeck, for sumptuous buildings; and Athens and Rome, for the civilization, refinement, and high accomplishment of their inhabitants. But London may be denominated the modern wonder of the world. The prodigious increase of houses, inhabitants, trade, commerce, and wealth, with the refinement and luxury which now prevail, render it superior to all the cities of modern Europe; and must excite the astonishment of such foreigners and Englishmen as have studied the local and comparative histories of places of note. It may be regarded as the focus of the British empire; for within its jurisdiction are concentrated the royal, legislative, juridical, civil, commercial, scientific, and literary concerns of Great Britain. Many writers have been employed, at different periods, to narrate the annals of this great town; and several volumes in folio, quarto, octavo, &c. have been exclusively devoted to the topographical history of London: but all are imperfect and unsatisfactory: the largest works being mostly tedious, trivial, and prolix; and the smaller publications are very superficial and inaccurate. At the end of this account will be given a list of several of these works; to point out the sources of the present

essay, and to furnish the reader, who may require more circumstantial information, with a guide to facilitate his researches. The following article will comprehend a general view of the history and local characteristics of this metropolis, with some particular descriptions; but for detailed accounts of many buildings, places, and objects, the reader is referred to the following heads, in different parts of this work: *BANK of England*, *BRIDEWELL*, *BRIDGES*, *COMPANY*, list of 91 in London, and accounts of the principal; *COLLEGE of Civilians*, or *Doctors-Commons*, *COLLEGE of Herolds*, *COLLEGE of Physicians*, *COLLEGE, Sign*, *COLLEGE of Surgeons*, *COLLEGE, Veterinary*, *ROYAL EXCHANGE*, *CUSTOM of London*, *DOCKS of London*, *EXCISE*, *FLEET-PRISON*, *GRESHAM COLLEGE*, *GUILDHALL*, *HOSPITALS of Bethlehem*, *Bridewell*, *Christ*, and *Foundling*, *INNS of Court*, *INSURANCE Companies*, *ISLINGTON*, *LAMBETH*, *HACKNEY*, *MARY-LE-BONE*, *PADDINGTON*, *MIDDLESEX*, *SERRY*, *NEWINGTON-BUTTS*, *THAMES*, *POLICE*, *PARLIAMENT*, *NEW-RIVER*, *LIMEHOUSE*, *STRATFORD-LE-BOW*, *SOUTHWARK*, *WESTMINSTER*.

The centre of London, or St. Paul's church, is ascertained to be in latitude $51^{\circ} 31' N.$, and in longitude $5^{\circ} 37' W.$ of Greenwich, where the royal national observatory is established. The distance of London from the principal cities of Europe is as follows: from Edinburgh 395 miles S.; from Dublin 338 S.E.; from Amsterdam 190 miles W.; from Paris 225 miles N.N.W.; from Copenhagen 610 miles S.W.; from Vienna 820 miles N.W.; from Madrid 860 miles N.E. by E.; from Rome 950 miles N.N.W.; from Constantinople 1660 miles; from Moscow 1660 miles E.S.E.; from Stockholm 750 miles; from Petersburg 1140 miles; from Berlin 540 miles; and from Lisbon 850 miles.

London, as considered in the aggregate, comprises the city and its liberties, with the city and liberties of Westminster, the borough of Southwark, and nearly thirty of the contiguous villages of Middlesex and Surry. The greatest portion is built on the northern bank of the Thames, or in Middlesex; whilst Southwark, with Lambeth, and several connecting villages, extend along the southern shore of the same river, in the county of Surry. The extent of London, from west to east, or from Knightsbridge to Poplar, is full seven miles and a half; whilst its breadth, from north to south, or from Newington Butts to Islington, is nearly five miles. The circumference of the whole, allowing for various inequalities in the extension of streets, &c. at the extremities, cannot be less than thirty miles. Hence it may be fairly estimated, that the buildings of this metropolis cover at least eighteen square miles, or 11,520 square acres. Out of this must be deducted the space occupied by the river Thames, which extends about seven miles, or 12,320 yards in length, by one quarter of a mile, or 400 yards in width; making 1120 square acres.

Independently of various local and civil divisions, London may be said to consist of five distinguishing parts, or popular portions: viz. the west end of the town, the city, the east end of the town, Westminster, and the Borough. The "west end of the town," extending from Charing-Cross to Hyde-park, and from St. James's park to Paddington, is considered the best and most fashionable part of the town, and is laid out in the two great thoroughfares, called Oxford road and Piccadilly, with various handsome squares and streets, which are chiefly occupied by the town-houses of the nobility and gentry, and the most fashionable shops. The "city" includes the central part, and most ancient division of the metropolis. This is the emporium of com-

merce, trade, and business; and is occupied by shops, warehouses, public offices, and houses of tradesmen and others connected with business. The "east end of the town," and its inhabitants, are devoted to commerce, to ship-building, and to every collateral branch connected with merchandize. This division of London has assumed a novel character since the commencement of the present century, by the vast commercial docks and warehouses that have been formed and constructed here. The southern bank of the Thames, from Deptford to Lambeth, bears some resemblance to the east end of the town; being occupied by persons engaged in commercial and maritime concerns; docks, wharfs, and warehouses being abundant. But this part of London has one distinguishing feature from any other, as it abounds with numerous and various manufactories; iron-foundries, glass-houses, soap-boilers, dye-houses, boat-builders, snut and hat manufactories, &c. and many other similar establishments. From the great number of fires employed in these houses, and offensive effluvia arising from some of the works, this district is rendered extremely unpleasant, if not unhealthy, for human residence. It is therefore mostly inhabited by workmen, labourers, and the lower classes of society. Many improvements have lately been made, and several respectable houses erected on St. George's field. In Westminster are the houses of lords and commons, the courts of justice, and many offices belonging to government. Another part of the metropolis, not hitherto noticed, but which may be considered as the last enlargement, and the most regular and systematic in its arrangement of squares, streets, &c. is the northern side of the town; comprehending a large mass of new buildings between Holborn and Somers-town, and in the parishes of Mary-le-bone and Paddington. Nothing shews the increased and increasing growth of the English metropolis more decisively than the vast number of new squares, streets, rows, and places, that have been recently erected, and are now in the progress of building, all round the metropolis. London is computed to contain nearly 70 squares, and 8000 streets, lanes, rows, courts, &c. According to a census obtained in the year 1811, the population of London, Westminster, and their suburbs, was 1,099,104 persons; being an increase of 133,139 within the course of ten years. Well might Cowper exclaim,

"Opulent, enlarged, and still increasing London."

It would be both amusing and interesting to trace the progressive growth or expansion of London; to describe it at different and remote periods; and delineate, with a careful and accurate pencil, the natural and artificial, the political and civil, the moral and commercial characteristics of the British metropolis, at different epochs. Some of these features will be noticed in the progress of our survey; but many must necessarily be omitted, from the peculiar nature of the present publication.

Ancient History and Antiquities of London.—It is generally admitted by topographers, that the present site of London was occupied as a British town before the arrival of the Romans. Of this, however, there is no evidence: for Geoffrey of Monmouth is not to be trusted, nor is his assertion entitled to respect. We are informed by Tacitus, that about the year 61, Londinium, or Colonia-Augusta, "was the chief residence of merchants, and the great mart of trade and commerce, though not dignified with the name of a colony." (Ann. lib. xiv. c. 33.) Boadicea, the amazonian queen of the Britons, headed a large body of natives, and, after conquering Camalodunum and Verulam, took posses-

tion of Londinium. At this time, it appears that Londinium was not fortified in the Roman manner, and was inferior to either of the other places just named. In a few years afterwards, the Romans made it a permanent station; surrounded it with a fortified wall of stone and brick, and governed the inhabitants by Roman laws. The course and extent of the walls were as follows: commencing at a fort, near the present tower of London, the wall was carried in a line directly north to Ald-gate; thence it made a curve to the south-west, to Bishops-gate, from which it continued in a straight line to Cripple-gate and Alders-gate; here it turned to the south, and proceeded to New-gate, where it made almost a right angle, turning to the south, to Lud-gate, and on to the banks of the Thames. The circuit of this part of the boundary, according to Stow, was nearly two miles and one furlong. Another wall, of about one mile in length, extended along the northern bank of the Thames, from the fort near the Tower to another fort near the present Black-friars bridge. These walls were defended, at different distances, by strong towers and bastions. The height of the wall is said to have been 22 feet, and the towers 40 feet. The superficial contents of the area thus enclosed have been computed at about 400 acres. Nearly through the middle of this station passed a stream, since called Wall-brooke. Dr. Stukeley, in his "Itinerarium Curiosum," has given a plan of Londinium, shewing the extent and form of the station, with the number of gates in the walls, and the military roads that branched off from it. The burial-places were without the walls, on the north and eastern sides of the town. Londinium was advanced from a *præfectura*, i. e. a town governed by a Roman præfect, to the rank of a colony. It also became the seat of the vicarius Britanniarum, and of the commissioners of the treasury under the Roman emperors. To enter into accounts of all the various remains of the Romans, which have been discovered at different times within the limits of London, would lead us into a long dissertation: it must suffice to state, that tessellated pavements, urns, coins, pottery, foundations of buildings, and other evident relics of the Romans, have been frequently found beneath the present surface. At the Bank, near the India house, and in Lombard street, some pavements have been taken up; and in various other parts of the city have been found evident traces of Roman habitations, and Roman customs. The London stone in Cannon street is considered, by most antiquaries, as part of a Roman millary. These are all particularly described in Brayley's Survey of London and Middlesex, vol. i. 1810.

Very little is known of London during the Anglo-Saxon dynasty; nor do we know of any buildings, or other local antiquities, which may be referred to that period. Under the Saxons, London, then called Lunden, Lundone, Lundenburg, Lundenes, Lundeneaster, gradually increased in extent and affluence; and, according to Bede, it then became the "emporium of many nations." Religious edifices were erected in the seventh century, on the sites of St. Paul's and Westminster Abbey. It is presumed there was a bridge across the Thames, near Westminster, previous to the year 994: as William of Malmesbury, when speaking of the repulse of the Danes under Sweyn and Olaf, says that "part of them were drowned in the river, because, in their hasty rage, they took no heed of the bridge." In the time of king Athelstan, a law was passed respecting coinage, by which it is specified that London was allowed eight minters, whilst only seven were appointed for the cities of Canterbury and Winchester.

Soon after the Roman conquest, a fortress or castle was built on the banks of the Thames; and this was enlarged

by Gundulph, Bishop of Rochester, who erected the White tower, within the Tower of London. In the same reign St. Paul's church was commenced; and the strong castles of Baynard and Montfichet, both of them standing on the banks of the Thames within the city walls, were erected by two of the Norman king's officers, named Baynard and Montfichet. During this and several succeeding reigns, the public buildings of London were greatly augmented in number, by the erection of several religious edifices, abbatial and episcopal residences. The royal palace at Westminster, which had been founded by Edward the Confessor, was considerably enlarged; and a large hall was built there by William Rufus. The reign of Henry I. was distinguished by the foundation and construction of many monastic houses; and several others were established during the Anglo-Norman and Plantagenet dynasties.

A list of the religious houses, with the time of their different foundations, will afford a tolerable idea of the gradual increase of the city, with respect to such establishments, and of the difference between ancient and modern London. The town appears to have contained no less than fifty-four monastic houses, such as abbies, priories, nunneries, hospitals, colleges, &c.

St. Paul's cathedral was first founded by Ethelbert, king of Kent; church rebuilt in 964; again in the time of William Rufus. The present church commenced in 1675.

The priory of St. Martin-le-Grand, founded by Withred, king of Kent, in the year 700; was given, in 1502, by Henry VII. to Westminster Abbey; the street of St. Martin-le-Grand is still annexed to Westminster.

The nunnery in Clerkenwell, founded in 1100, by sir Jordan Briset.

The hospital of St. John of Jerusalem, in Clerkenwell, was founded in 1100, by the same.

The Holy Trinity, or Christ-church, within Ald-gate, was founded by the empress Maud, in 1108, for Austin canons.

The priory of St. Bartholomew in West Smithfield was begun by Rahere, in 1123; the hospital soon afterwards.

A Benedictine nunnery of Haliwell, by Robert Fitz-Gelran, before 1127.

St. Katherine near the Tower, by the empress, before 1148.

The Old Temple of Holborn, in 1118; and the new one near Fleet-street, by the order, in 1185.

St. Mary Spittle, by Walter Brune, in 1197.

St. Thomas of Acre, in the end of Henry II.'s reign, by Thomas Fitz-Theobald.

The college of Allhallows Barking, by Richard I.

The nunnery of St. Helen's, in Bishops-gate-street, was founded by William Fitz-William, in 1210.

The Black Friars had a house near Chancery-lane, but afterwards begged or bought the ground near Caille Baynard, soon after 1221.

The Grey Friars, about 1224; afterwards in Newgate street.

The White Friars, by sir Rich Grey, in 1241.

A priory for Austin Friars was established in Broad-street, by Humphry Bohun, earl of Hereford, in 1253.

The Friars of the Sack, Old Jewry, 1257. Order dissolved, 1307.

The Crossed or Crutched Friars, by Ralph Hoesier and William Saberns, in 1298.

The Rolls, or Domus Converterorum, by Henry III. in 1231, for the conversion of Jews.

St. Mary Rouncivall in the Strand, about the same period.

L O N D O N.

The hospital or priory of St. Mary of Bethelam or Bedlam, was granted by Simon Fitz-Mary, in 1247.

The convent of St. Clare, in the Minories, by Edmund earl of Lancaster, in 1293.

A college and hospital, called Elsing Spittle, were founded by William Elsing, a citizen, in 1329.

Sir John Pountney founded a college in Cannon-street, in 1332.

St. Mary of Graces, or East-Minster, a Cistercian abbey, was founded by king Edward III. in 1350.

The Charter-House, before 1370, by sir Walter de Manny, and Michael de Northburgh, bishop of London. See CHARTREUSE.

The hospital of the Savoy, in 1505, by Henry VII.

Besides these, the guilds or fraternities of London were very numerous. There was a brotherhood and chapel of the Holy Trinity in Leadenhall, and several others were founded in most churches. The grand suppression of the whole commenced in 1537. Exclusive of the religious houses, the bishops and parliamentary abbots had each a town residence of state.

The abbot of St. Anslin's, Canterbury, house was in the parish of St. Olave's, Southwark.

The abbot of Eveham's, in the parish of St. Catherine Cree.

The abbot of Reading's, at Baynard castle, in the parish of St. Andrew Wardrobe.

The abbot of St. Mary's, York, at St. Peter's Place, Paul's Wharf.

The abbot of Glastonbury, in West Smithfield.

The abbot of Hyde, in the parish of St. Mary at Hill.

The abbot of Ramsey, in Whitecross-street.

The abbot of Bury St. Edmund's, in St. Mary-street, Aldgate.

The abbot of St. Alban's, in Lothbury.

The abbot of Peterborough, in the parish of St. Gregory.

The abbot of Salop, near St. Bartholomew's, West Smithfield.

The abbot of Leicester, in the parish of St. Sepulchre.

One instance of the service which was rendered to the public, even in London, by the monastic institutions, is worthy of note: the priory of St. Mary Spittle contained, at its dissolution about the year 1536, no less than 180 beds for the reception of sick persons and travellers. The hospitals which were suffered to remain, owed their continuance to sir Richard Gresham, mayor of London, in 1537, who petitioned the king to bestow the lands belonging to this, St. Bartholomew's, St. Thomas's, and the new abbey on Tower-hill, on the corporation, for the relief and use of the poor, the sick, and the vagrant.

Annals of London, from the Departure of the Romans to the Accession of Edward I.—When the Romans, from the distracted state of the empire, found it necessary, in the early part of the fifth century, to withdraw their troops from the distant provinces, London again became a British town, and is mentioned in the Saxon chronicle in the year 457, when the Britons fled thither on their defeat by the Saxons under Hengist, who, about twenty years afterwards, made himself master of London; but on his death, in 498, it was retaken by Ambrosius, and retained by the Britons during a considerable part of the next century. It afterwards became subjected to the newly-established Saxon kingdom of Essex. On the conversion of the East Saxons to Christianity, London was nominated as the bishop's see, Melitus being appointed the first bishop in the year 604: a cathedral church

was erected in 610, on the site of the present St. Paul's. During the period of the Saxon heptarchy, but few notices of London appear to have been recorded. In 664 it was ravaged by the plague; and in 764, 798, and 801, it suffered severely by fires; in that of 798 it was almost wholly consumed, and great numbers of the inhabitants perished. On the union of the Saxon kingdom under Egbert, London, though not the royal residence, or seat of government, as has been erroneously stated, was advancing in consequence, as appears from a Wittenagemot having been held here in 833, to consult on proper means to repel the Danes. By these invaders London was repeatedly pillaged and laid waste. In 925 king Athelstan had a palace here; the city increased in importance under the Danish sovereigns, and under Edward the Confessor; and on the successful invasion of William the Conqueror, the magistrates of London, conjointly with the prelates and nobility, invited him to accept the title of king of England. From this period London may be considered as the metropolis of the kingdom.

William, at the commencement of his reign, granted a charter to the citizens, which is beautifully written in the Saxon characters, and is still preserved among the city archives: it consists of only five lines on a slip of parchment, six inches long and one broad. In the year 1077 the greatest part of the city was destroyed by fire. In the following year the king founded the fortress, now called the White Tower, for the purpose of keeping the citizens in awe, as he had reason to suspect their fidelity. In 1086 another fire consumed the principal part of the city, together with the church of St. Paul. Maurice, then bishop of London, laid the foundation of the new church: "a worke," Stow observes, "that men of that time judged would never have been finished, it was then so wonderful." It is remarkable that Domesday book, though so minute in regard to other cities and towns, does not contain any notice of London. A vineyard is mentioned in Holborn belonging to the crown, and ten acres of land near Bishopsgate (now the manor of Norton-Falgate) belonging to the dean and chapter of St. Paul's. In November, 1090, above 600 houses and several churches were blown down by a tremendous hurricane, and Stow says, "the Tower of London was also broken." About two years afterwards another destructive fire happened. In the succeeding years William Rufus repaired the Tower, and strengthened it by additional works; and in 1097 he built a great hall at Westminster. Henry I., as a reward for the ready submission of the Londoners to his usurped authority, granted to the city an extensive charter of privileges, among which was the perpetual sheriffwick of Middlesex. On the death of Henry, the Londoners took a decided part in favour of Stephen in his contest with the empress, and greatly contributed to his establishment on the throne. In the first year of his reign a fire, beginning near London Stone, consumed all the houses eastward to Aldgate, and westward to St. Paul's, together with London bridge, which was then of wood. Henry II. does not appear to have held the citizens in any great degree of favour, probably resenting their attachment to Stephen; and we find that large sums of money were extorted from them under the specious name of Free-gifts. In 1176 the building of a new bridge of stone was commenced at London, but was not completed till the year 1209. On the coronation of Richard I. a dreadful massacre of the Jews, who were settled in London, was made by the brutal and ignorant populace. At the coronation-dinner, the chief magistrate of London, who at that time had the title of bailiff, acted as chief butler. Early in this reign

reign the appellation was changed to that of mayor, in the person of Henry Fitz Alwyn. Richard granted the city a new charter, confirming all its liberties, with additional privileges; and four years afterwards, on payment of 1500*l.* he granted another, providing for the removal of all weirs that had been erected on the river Thames; on this charter the corporation of London found their claim to the confederatorship of that noble stream. In 1196, a sedition arose in London, headed by William Fitz Osbert, who excited the common people to oppose the government, and gained associates to the amount of 50,000; but the leader being taken and executed, the commotion subsided. This is one of the first instances upon record of a tumultuous assemblage in defence of popular rights. In the reign of king John the civic importance of London was greatly increased; and its corporation finally assumed that form and predominancy, which, with a few alterations, it has maintained till the present time. John granted the city several charters; by one he empowered the "barons of the city of London" to choose a mayor annually, or to continue the same person from year to year, at their own pleasure. In 1212 a dreadful calamity took place, through a fire which commenced at the bridge end in Southwark, and occasioned a destruction almost unparalleled from such a cause: Stow relates that about 3000 persons perished. During the contest between the king and pope Innocent III. London severely felt the consequences of the interdict which was laid upon the kingdom. In the civil feuds, which marked the latter years of John, the Londoners sided with the barons; and when the humbled monarch was compelled to sign Magna Charta, it was therein expressly stipulated that the "city of London should have all its ancient privileges and free customs as well by land as by water." The long reign of Henry III. affords but few events worthy of notice respecting London: its growing prosperity was checked by a series of extortions and oppressions. In 1258, the price of corn was so excessive, that a famine ensued, and according to the chronicles of Evesham, 20,000 persons died of hunger in London only. In 1264 another massacre of the Jews took place; on a plea that one of that persecuted race had taken more than legal interest, and upwards of 500 Jews were put to death by the populace, and their houses and synagogues destroyed.

Annals of London from the Accession of Edward I. to that of Henry IV.—In the year 1279 all the Jews in England were apprehended in one day, on a charge of their being the authors of the great mutilations which had taken place in the coin during the preceding reign: 280 persons of both sexes were executed in London, besides many others in various parts of the kingdom. Between the years 1314 and 1317 the city, in common with the rest of the kingdom, suffered greatly from a scarcity of provisions, which eventually produced a complete famine. King Edward III., on the commencement of his reign, granted to the city two charters: by the first all the ancient privileges were confirmed and additional ones bestowed; by the other, the village of Southwark was granted to the citizens in perpetuity. In 1348, the terrible pestilence, which, breaking out in India, spread itself westward through every country on the globe, reached England. Its ravages in London were so great, that the common cemeteries were not sufficiently capacious for the interment of the dead; and various pieces of ground without the walls were assigned for burial places: amongst these was the waste land now forming the precinct of the Charter-house, where upwards of 50,000 bodies were then deposited. This destructive disorder did not entirely subside till 1357. The public entry of Edward the

Black Prince into London, May 24, 1356, after the victory he obtained at Poitiers, was celebrated with an unparalleled degree of splendour; and every street through which the cavalcade passed, exhibited an extraordinary display of riches and magnificence. The captive king of France, dressed in regal robes, was mounted on a white courser, while the victorious prince rode by his side on a small black horse, and appeared more like an attendant than a conqueror. In 1361, the plague having again broke out in France, every precaution was taken to prevent its spreading into England, but without effect; the pestilence reached London, and its ravages were so destructive, that upwards of 2000 persons fell victims in two days. In 1363, a sumptuous entertainment was given in the city by Henry Picard, alderman, to the kings of England, France, Scotland, and Cyprus, to Edward the Black Prince, and to a great number of nobility and gentry. The year 1378 is memorable in the city annals for the expedition fitted out by an individual, John Philpot, against Mercer, the Scottish pirate, who taking advantage of the inattention of government to naval affairs, carried off all the shipping from the port of Scarborough; and continuing to infest the northern coast, frequently made considerable prizes. The complaints of the merchants were but little regarded by the council; when Philpot prepared a fleet at his own expence, with a thousand men well armed, went himself on board as commander-in-chief, and failed in pursuit of the pirate. A long and desperate engagement ensued; but Philpot obtained the victory, and obliged the pirate to surrender, with most of his ships, among which were fifteen Spanish vessels richly laden. In November 1380, the fourth year of Richard II. an act of parliament was passed for levying a poll-tax on every person in the kingdom, male or female, above the age of fifteen years. This act was the occasion of producing, in the following year, one of the most dangerous insurrections that ever threatened the monarchy of this kingdom; and in which the metropolis particularly suffered. The tax was exacted with great rigour; and the insolence of the collectors was an additional cause of irritation, and kindled the sparks of sedition which soon after burst into an open flame. The insurrection began in Essex, but quickly spread through the neighbouring counties, and particularly in Kent, where the daughter of Wat Tyler, so called from his trade, having been indecently treated by a collector, the father killed him, and being supported by the insurgents, placed himself at their head. To his standard incredible numbers flocked from all parts of the kingdom; and on the 10th of June, 1381, having mustered on Blackheath a hundred thousand strong, they entered Southwark, where they set at liberty the prisoners from the King's Bench and Marshalsea prisons, and levelled the houses of all lawyers. They burnt the archbishop's palace at Lambeth, with the rich furniture, books, and registers, and destroyed the public stewes which were then tolerated on Bankside. For one day the bridge gate was shut against them; but they were afterwards, from prudential motives, admitted into the city. They then proceeded to the palace of the Savoy, which was one of the most magnificent structures in the kingdom. Having set fire to it in several places, they caused proclamation to be made, that no person should convert any part of the rich effects to his own use, and actually threw into the fire one of their companions who had reserved a piece of plate. They also burnt the Temple and the other inns of court. Dividing into three parties, one advanced to the rich priory of St. John of Jerusalem, near Smithfield, which they burned; a second division marched to the Tower, where they seized sir Robert Hales, lord treasurer, and Simon Sudbury;

Sudbury, archbishop of Canterbury, and lord chancellor (though guarded by 1200 soldiers), and hurrying them to the adjacent hill, beheaded them; the third division proceeded to Mile End, where the king met them, and promised to redress their supposed grievances, on which they dispersed. But Wat Tyler, with his party, under the pretence of reforming abuses, continued their ravages in London, liberated the prisoners from the Fleet and Newgate, plundered the houses of the Lombards who resided in the street, which yet retains their name, and dragging the merchants from the churches, whither they had fled for refuge, beheaded them in the streets. Not content with murdering many of the most eminent citizens, they made proclamation for beheading all lawyers and persons connected with the Exchequer, and even all who, in those days of ignorance, were capable of writing. The king made another effort for negotiation: attended only by forty horse, he met Tyler with 20,000 of his adherents in Smithfield. The behaviour of Tyler was so insolent, that the king ordered the mayor, sir William Walworth, to arrest him; on his resistance, sir William felled him to the ground with his sword, and the attendants dispatched him. The rebels prepared to revenge their leader's death; but Richard, though only fifteen years of age, with a prudence and bravery which did him more credit than any other action of his life, rode forward, exclaiming, "My friends, will you kill your king? Be not troubled for the loss of your leader; I will be your captain, and grant what you desire." They then marched under his direction to St. George's Fields, where, finding a thousand citizens completely armed to oppose them, they threw down their weapons, obtained their pardon, and immediately dispersed. Thus ended an insurrection unparalleled in the annals of this kingdom, and which for three weeks seemed to threaten a total subversion of the government. In 1390, the king appointed a tournament to be held in London, and sent heralds to proclaim his intention to all the principal courts of Europe, whence many princes and nobles came to attend the spectacle, which was continued with the greatest splendour for four days; open house being kept at the king's expence for all persons of distinction. The vast expenditure which this and similar festivities occasioned, frequently reduced Richard to great pecuniary difficulties; his enormous profusion led him to a system of oppression and extortion, which eventually caused his deposition and death.

Annals of London from the Accession of Henry IV. to that of Elizabeth.—At the coronation of the new king, the mayor, as usual, officiated as chief butler. The citizens were gratified by the repeal of some obnoxious statutes, and an extension of their privileges. In 1401, an act was passed for "burning obstinate heretics," entirely aimed at the Lollards, or followers of Wickliffe. The first victim was William Santer, parish priest of St. Ofyth, in Syth-lane, London. In 1407, the Plague again ravaged the kingdom, and swept away more than 30,000 of the inhabitants of the metropolis. In 1409, "a great play, of Matter from the Creation of the World," was acted at Skinner's-Well, near Clerkenwell. The exhibition lasted eight days; at which were present the king and most of the nobility and gentry of the realm. In the following year, John Bradley was condemned as a Wickliffite, and burnt in Smithfield, with circumstances of peculiar cruelty. In this year Guildhall was erected; the city hall before being a mean cottage in Aldermanbury. The return of king Henry V. after the glorious victory obtained at Agincourt in 1415, was celebrated in London with great magnificence. Neither this reign nor the following produced any events of peculiar import to the city, till the year 1450, when a new insurrection arose, of so formidable a

nature, that for some weeks all the power of the crown was insufficient to quell it. This tumult is supposed to have been raised by the instigation of the duke of York, in order to found the inclination of the people, and prepare the nation for his design of seizing that sceptre which Henry swayed so feebly. By the secret instructions of the duke, Jack Cade, who had served under him in the French wars, assumed the name of Mortimer, and collected a strong body of malcontents, under the popular pretext of redress of grievances. They entered the city in triumph, and for some time bore down all opposition; and beheaded the lord treasurer, lord Say, and several other persons of note. The insurgents at length losing ground, a general pardon was proclaimed, and Cade, finding himself deserted by his followers, fled: but a reward being offered for his apprehension, he was discovered, and refusing to surrender, was killed. The remainder of this reign was filled up with the dreadful contest between the Lancastrians and Yorkists, which ended in the deposition of Henry and the establishment of Edward IV. on the throne. The year 1472 will ever be memorable in the annals of the metropolis, for the introduction of printing into this country by William Caxton, citizen and mercer. The history of the kingdom during this reign and that of Richard III. does not in any particular manner affect the concerns of the city. Soon after the accession of Henry VII. in 1485, an epidemical disorder of a very singular nature, called the *sweating sickness* , raged with great violence in London. Those attacked by it were thrown into a violent perspiration, which generally occasioned their death within twenty-four hours. It appears from Hall's Chronicle, that two mayors and six aldermen died of this complaint in one week. This reign was particularly marked by oppression and extortion on the part of the king; and the tumults and insurrections occasioned thereby, particularly that in support of Perkin Warbeck, who was asserted to be Richard, duke of York, and the heir to the throne. In this event, though highly interesting to the kingdom, the city was not immediately concerned. In 1500 the kingdom was again visited by the Plague, of which 30,000 persons died in the metropolis and its vicinity. In the reign of Henry VIII. when he attempted to raise money without the aid of parliament, the citizens made such determined opposition to the measure, and their example had such an influence through the kingdom, that the king, in full council, abandoned his design, and granted a pardon to all who had opposed him. On the king's marriage with Anne Boleyn, in 1533, she was conveyed from Greenwich to the Tower, and thence through the city to Westminster, with all the magnificence and pageantry which unbounded prodigality could devise. The remainder of this reign was notorious for the tyranny and cruelty of the king, who, having thrown off the pope's supremacy, sacrificed all who adhered to it: yet professing a zealous attachment to the doctrines of the church of Rome, he put to death those persons who presumed to differ from him. Hence the promoters of reformation, and its opposers, perished in the same flames; the blood of the Catholic and Protestant was shed upon the same block; and Henry, whilst vehemently contending against the pope's infallibility, supported his own with the most vindictive cruelty. In these sanguinary scenes, London had its full share; great numbers, of all ranks, were continually executed, either for heresy or treason. The suppression of the monasteries now took place: opposition to the king's will was fatal; and the partial insurrections which broke out in consequence, only served to forward his measures, by giving the colour of necessity to the vengeance that was inflicted. Many improvements were made during this reign in the city and its suburbs.

suburbs. The police was better regulated; nuisances were removed; the streets and avenues were amended and paved; and various regulations were carried into effect for supplying the metropolis with provisions, to answer the demands of an increasing population. In the short reign of Edward VI. the reformation proceeded with steadiness and regularity; but on the accession of Mary the church of Rome again gained the ascendancy. On the projected union between the queen and the king of Spain, a formidable insurrection ensued, in which the city was particularly affected: the suppression of this revolt was followed by a dreadful scene of sanguinary triumph. The statutes against heretics were now also enforced with great severity. A number of persons were burnt in Smithfield: in the whole kingdom upwards of 200 were brought to the stake.

Annals of London from the Accession of Elizabeth to the Revolution in 1688—Elizabeth succeeded her sister amidst the acclamations of all ranks of people. Reformation again reared its head, and was in a short time firmly established. In 1561 the spire of St. Paul's cathedral was struck by lightning, and great part of the building consumed. In 1563 the Plague again made dreadful ravages, to which 20,000 persons fell victims in the city. In July 1566, the foundations of the Royal Exchange were laid by sir Thomas Greham, and the structure was completed in the following year. The year 1569 exhibited a novelty in London of most pernicious example. The first public lottery was then drawn at the west door of St. Paul's cathedral, and the drawing continued, without interruption, from January 11 to May 6. The prizes were of plate, and the profits were appropriated to the repair of the sea-ports. In 1586 a conspiracy was set on foot to assassinate Elizabeth, and free the queen of Scots from the captivity in which she had passed almost eighteen years. The plot was soon discovered, and the conspirators, fourteen in number, were executed in Lincoln's-inn-Fields. Mary was said to be implicated in the conspiracy; and this, whether true or false, furnished a plausible pretext for those proceedings, which soon after condemned her to the block. The sentence against her was proclaimed with great solemnity at different places in London and Westminster. In the preparations made to repel the threatened attack of the boasted Spanish Armada, London took a most distinguished share, in furnishing large supplies of money, men, and ships. The preparations for the coronation of king James were interrupted by a dreadful Plague, which ravaged the city with greater violence than any similar visitation since the time of Edward III. In 1604, the horrible conspiracy, known in history by the name of the "Gunpowder Plot," the grand object of which was to prepare the way for the restoration of the Catholic religion, was commenced by its daring contrivers, with every possible precaution that seemed necessary to ensure its success. The destruction of the king and parliament was the preliminary measure through which the conspirators thought to accomplish their design; and the blowing up of the parliament-house with gunpowder at the moment when the sovereign should be commencing the business of the session by the accustomed speech from the throne, was the dreadful means by which the destruction was intended to be accomplished. All the principal conspirators were bigotted Catholics, who had for many years been plotting the downfall of Protestantism in this country, and had even applied for aid to Spain and Flanders. Being disappointed of the assistance they required, they resolved to depend on their own efforts, and about Easter 1604, formed the idea of the gunpowder plot, to be carried into effect on the meeting of parliament in February

following. Accordingly Percy, one of the conspirators, hired a house immediately adjoining to the house of lords, and the operations commenced by digging through the foundation-wall, which was nine feet in thickness. Just at this juncture, a vault under the parliament-house, used as a depository for coals, was to be let, and the coals to be sold. As nothing could have happened more favourable for their purpose, Percy hired the cellar, and bought the coals, as if for domestic use, and without any appearance of concealment. The prorogation of parliament from February to October gave the conspirators sufficient leisure to further their design; and, at convenient opportunities, thirty barrels and four hogheads of gunpowder, which had been procured from Holland, were conveyed into the cellar by night, and covered with billets, faggots, iron-bars, and stones. This was done without exciting any suspicion: parliament had again been prorogued to November 5th; and the conspiracy wore every aspect of success. It had now been on foot eighteen months, and confided to more than twenty persons; yet nothing had led a single step toward discovery; when the plan was happily frustrated by a circumstance apparently trivial. One of the conspirators, wishing to save lord Monteagle, sent him a letter, advising him, in ambiguous terms, to absent himself from parliament, on account of a sudden danger to which he would be exposed. This notice Monteagle carried to the secretary of state, who laid it before the privy-council. A secret search was determined on, but, to prevent suspicion, was delayed till the eve of the meeting of parliament, and then made only by the lord chamberlain, as if in a formal discharge of his office. When he entered the cellar, and saw the great store of coals and wood, he enquired to whom it belonged, and was informed the cellar was let to Mr. Percy, and the fuel was for his consumption. The chamberlain heard this with seeming carelessness, and left the cellar with apparent negligence. But at midnight a further search was made; Guy Fawkes, a principal conspirator, to whom the final execution of the plot was assigned, was apprehended in the cellar: the fuel was removed, and the gunpowder discovered. Fawkes gloried in the plot, but refused to discover his accomplices; the sight of the rack, however, subdued him, and he made a full disclosure of the whole conspiracy. His associates fled into Warwickshire, where they endeavoured to excite a rising of the Catholics, but without effect. A proper force was sent against them, four were killed in resistance, and the rest were taken and brought to London, where, with Fawkes, they suffered the just punishment of their guilt. In the year 1609, the city acquired a considerable accession of power and property: almost the whole province of Ulster, in Ireland, having fallen to the crown, the king made an offer of the escheated lands to the city, on condition they would establish an English colony there. The proposal was accepted; and so rapid was the colonization forwarded, that within seven years arose the two capital towns of Londonderry and Coleraine. The commencement of Charles I.'s reign was marked by the return of the plague, which carried off in the metropolis 25,000 persons. To advert to all the important transactions that took place in London during the eventful struggle between Charles and his people would far exceed our limits. The excessive oppressions to which the nation was subjected, were more particularly felt in the metropolis than in other parts of the kingdom, from its being more directly within the vortex of the star-chamber and high-commission courts, and from the effects of the monopolies, which had a most pernicious influence on trade and

commerce. For the particulars of this important period, we refer our readers to Clarendon's History of the Great Rebellion.

The year 1665 became memorable in London by the dreadful ravages of the great Plague, which first made its appearance in December 1664, and had not entirely ceased till January 1666. Its progress, the first two or three months, was comparatively small, but continued to advance, notwithstanding every precaution was used to abate its fury: from May to October 1665, it raged with the greatest violence; the deaths progressively increased from five hundred to eight thousand weekly. The pestilence was now at its height: its ravages, which commenced in Westminster and the western suburbs, extended through the city to Southwark, and to all the parishes eastward of the Tower. The digging of single graves had long been discontinued, and large pits had been excavated, in which the dead were deposited with some little regularity and decent attention: but now all regard to ceremony became impossible. Deeper and more extensive pits were dug, and the rich and the poor, the young and the aged, the adult and the infant, were all promiscuously thrown together into one common receptacle. Whole families, and even whole streets of families, were swept away together. By day, the streets presented a most frightful aspect of desolation and misery; and at night the dead carts, moving with slow pace by torch-light, and with the appalling cry, "Bring out your Dead," thrilled horror through every heart that was not by suffering hardened to insensibility. The stoppage of public business was so complete, that grass grew within the area of the Royal Exchange, and even in the principal streets of the city: all the inns of court were shut up, and all law proceedings suspended. The entire number returned in the bills of mortality, as having died of the plague within the year, was 68,950; yet there can be no doubt that this total fell short, by many thousands, of those who actually fell by the infection, but whose deaths were not officially recorded. The aggregate is estimated at about 100,000. The whole number of deaths within that year, as given in the bills, was 97,306. Since this dreadful period, the plague has entirely ceased in London: a circumstance that must be regarded as the more remarkable, when it is considered how frequent had been its ravages for ages past, and when reference is had to the bills of mortality for the preceding part of this very century, when scarcely a year passed without some persons falling victims to the infection. For further particulars, see PLAGUE.

The most important event that ever happened in this metropolis, whether it be considered in reference to its immediate effects, or to its remote consequences, was the great Fire, which broke out in the morning of Sunday, September 2, 1666, and, being impelled by strong winds, raged with irresistible fury nearly four days and nights, nor was it entirely mastered till the fifth morning. The destructive extent of this conflagration was, perhaps, never exceeded in any part of the world, by any fire originating in accident. Within the walls it consumed almost five-sixths of the whole city; and without the walls, it cleared a space nearly as extensive as the one-sixth part left unburnt within. Scarcely a single building, that came within the range of the flames, was left standing. Public buildings, churches, and dwelling-houses were alike involved in one common fate; and, making a proper allowance for irregularities, it may fairly be stated, that the fire extended its ravages over a space of ground equal to an oblong square, measuring upwards of a mile in length, and half a mile in breadth. In the summary ac-

count of this vast devastation given in one of the inscriptions on the monument, and which was drawn up from the reports of the surveyors appointed after the fire, it is stated, that "the ruins of the city were 436 acres, viz. 373 acres within the walls, and 63 in the liberties of the city; that of the six-and-twenty wards it utterly destroyed fifteen, and left eight others shattered and half burnt; and that it consumed 400 streets, 13,200 dwelling-houses, 89 churches, besides chapels; four of the city gates, Guildhall, many public structures, hospitals, schools, libraries, and a vast number of stately edifices." The immense property destroyed in this dreadful conflagration could never be calculated with any tolerable degree of exactness; but according to the best estimations that have been made, the total value must have amounted to the immense sum of ten millions of pounds sterling. As soon as the general consternation had subsided, the rebuilding of the city became the first object of consideration; an act of parliament was passed for that purpose; and though all was not done that might have been, the city was principally rebuilt within little more than four years, and that in a style of far greater expence and regularity, and infinitely more commodious and healthful, than the ancient capital. In the system of tyranny and oppression which marked the reign of Charles II. the city largely participated; having its ancient liberties and privileges invaded, and magistrates arbitrarily forced on the citizen at the pleasure of the king. Every principle of law and justice was violated; and in this humiliating state London continued till the revolution.

Annals of London from the Revolution in 1688, to the present Time.—In the first year of William and Mary, an act was passed, by which all proceedings of former reigns against the city charters were reversed, and all the rights and privileges of the citizens were fully re-established. In 1692, during the king's absence in Holland, the queen borrowed 200,000*l.* of the city for the exigencies of government. In 1694, an infamous system of bribery was investigated by the house of commons, when it was proved, that a thousand guineas had been demanded and taken from the chamberlain of London by sir John Trevor the speaker, for forwarding the Orphan bill; in consequence of which he was expelled the house. In 1697, an act of parliament was passed for the suppression of the much abused privilege of sanctuary, heretofore attached to the following places, viz. the sanctuary in the Minories, Salisbury-court, White-friars, Ram-alley, and Mitre-court in Fleet-street; Fulwoods-rents in Holborn; Baldwin's-gardens in Gray's-inn-lane; the Savoy in the Strand; and Montague-cloise, Deadman's-place, the Clink, and the Mint, in Southwark. The year 1703 was remarkable for a dreadful storm of wind, which raged through the night of the 26th of November. The damage sustained by the city alone was estimated at two millions sterling; and in the suburbs the damage was proportionably great: the lead on the tops of several churches was rolled up like skins of parchment; and at Westminster-abbey, Christ's-hospital, St. Andrew's Holborn, and many other places, it was carried off from the buildings. The ships in the river were driven from their moorings; four hundred wherries were lost; more than sixty barges were driven foul of London-bridge, and as many more were sunk or flaved above the bridge. At sea the destruction was immense; twelve men of war, with more than eighteen hundred men on board, were lost within sight of their own shore. The year 1709 was marked by a circumstance highly creditable to the humanity of the nation. The cruel depredations of the French in the palatinate compelled the inhabitants to desert

desert their country; twelve thousand, in the most forlorn condition, sought refuge in London: the queen, for some time, supported them out of her privy purse; she was afterwards assisted by the benevolence of her subjects, and 22,038*l.* was paid into the chamber of the city for the relief of these distressed fugitives, who were finally disposed of as colonists to Ireland and North America.

The increase in the population of the metropolis having occasioned a great insufficiency in places for divine worship, an act of parliament was passed in 1711 for erecting fifty new churches in and about London: the expense of which was defrayed by a final duty on coals brought into the port of London for about eight years. The year 1720 will ever be famous in the annals of London, from the destructive system of speculation and fraud which history has denominated the South Sea bubble; and which so completely infatuated the people, that they became the dupes of the most barefaced impositions. (See BUBBLE, in *Commerce*.) The directors of the South Sea Company, encouraged by the prevalent spirit of avaricious enterprise, proposed to the government to take into their fund all the debts of the nation, under the plausible pretext of a speedier redemption. The amount of the debts was 31,664,551*l.*; for the liberty of adding the whole of which to their capital stock, they offered to pay to the public the immense sum of 7,723,809*l.* This bait was too tempting to be refused; the plan received the sanction of parliament, and the directors were empowered to raise the ready money necessary for so great an undertaking, "by opening books of subscription, and granting annuities to such public creditors as were willing to exchange the security of the crown for that of the South Sea Company, with the advantage of sharing in the emoluments that might arise from their commerce." So much was the public mind impressed with the idea of rapid gain, that before the act received the royal assent, the company's stock rose to 31*g*l. *per cent.*: it advanced so amazingly for three months, that books were then opened for a fresh subscription of four millions at 1000 *per cent.*; and such was the popular frenzy, that within a fortnight the new subscription was at 200 *per cent.* premium. Some alarm now prevailed: it had been whispered, that the directors and their friends had disposed of their own stock while the price was at the highest; and all confidence in the stability of their credit was destroyed. The confusion became general; every one was willing to sell, but no purchasers could be found, except at a vast reduction. Distraction and dismay spread through the city; the stock fell rapidly, and, before the end of the year, was reduced to 86 *per cent.* which was about its real value. The destruction to public and private credit, thus produced, was excessive: all trade was at a stand; and many of the most respectable merchants, goldsmiths, and bankers of London, who had unwisely lent large sums to the company, were obliged to abscond. A parliamentary investigation ensued; and the knavery of the directors was so apparent, that the greater part of their estates was confiscated for the benefit of those whom their villainy had ruined. The sum thus obtained amounted to 2,014,000*l.*

During the continuance of the infatuation which the South Sea delusion inspired into all classes of people, many other visionary projects were set on foot by speculators and gamblers; even chartered companies of established credit lent their countenance to schemes of impossible accomplishment: nearly two hundred subscription projects were afloat at one time. When the public confidence in the South Sea scheme was on the decline, the superior stability of the bank of England, East India, and African companies, was at once seen: Bank stock rose from 100 to 260; East India stock

from 100 to 405; and African stock from 100 to 200. The shares in the London and Royal Exchange Assurance Companies also experienced a prodigious rise. See INSURANCE.

The close of the year 1729 was attended by a great mortality in London; the deaths within the bills of mortality in the course of the year amounting to almost 32,000. The pernicious habit of dram-drinking had become to general, and so many disorders had been occasioned, and crimes committed in consequence of it, that in the year 1735 the legislature found it necessary to prohibit the selling of Geneva, except under certain restrictions. Previous to this, the magistrates had ascertained that the number of gin-shops in London and Westminster was 7044, besides garrets and cellars where the baneful liquor was sold privately. So determined were the retailers to carry on their trade, that the utmost exertions of the police were required to enforce the act; and within two years, 12,000 persons were convicted and fined under its provisions.

The winter of 1739—40 was memorable from the occurrence of one of the most intense frosts ever known in this country, and which is recorded in our annals by the appellation of the Great Frost; it commenced on Christmas-day, and lasted till the 17th of February: above bridge the Thames was completely frozen over, and numerous booths were erected on it for selling liquors, &c. to the multitudes who daily flocked thither. Great improvements were now made in different parts of the metropolis; and convenience, health, and safety, were more generally attended to than they had previously been. Westminster bridge was finished and opened for public use in the year 1750; the houses upon London bridge were pulled down in 1756; and in the two succeeding years the bridge was put into a course of repair. In 1760 Black-friars' bridge was commenced; most of the city gates were taken down; and an act of parliament was obtained for making alterations in the avenues of the city and its liberties; some of which have been carried into effect at different periods, yet many others remain to be executed. In the year 1763, the recent peace with France, the resignation of Mr. Pitt, afterwards earl of Chatham, as premier, and other political occurrences, set the metropolis into a complete ferment. The conduct of administration was such, as to augment rather than obviate the prevailing discontents. Hence the ministry were assailed with political publications; in particular by a periodical paper called "The North Briton;" the writers of which, the principal of whom was John Wilkes, were determined to expose the measures of the then administration to the contempt they deserved. The forty-fifth number of this paper contained such severe reflections on the king's speech to parliament, that the ministry thought they had an opportunity to crush their avowed enemy. Mr. Wilkes was apprehended and committed to the Tower under an illegal warrant, signed by the principal secretary of state; but the case being argued in the court of Common Pleas, before lord chief justice Pratt, the court directed him to be discharged. Mr. Wilkes brought actions against the earl of Halifax, secretary of state, for issuing the warrant, and against Mr. Wood, under-secretary, and obtained verdicts with damages; 400*l.* from the former, and 1200*l.* from the latter. Shortly after his release, Mr. Wilkes established a printing-press in his own house, and republished all the numbers of the obnoxious paper. This provoked the ministry to highly, that an information was filed against him. The "North Briton, No. 45," was voted by the house of commons to be a seditious libel, and ordered to be burnt by the common hangman. Mr. Wilkes was expelled the house:

and though he retired to France, his trial was brought on in his absence, when he was found guilty of republishing the libel, and was consequently outlawed. Four years afterwards he returned to England, his outlawry was reversed, and he was sentenced to two years in prison; during which he was elected an alderman of London, and knight of the shire for Middlesex.

In the year 1780, from a cause apparently harmless, a petition to parliament from the Protestant Association, arose an insurrection, composed chiefly of the lowest of the people, which for a week bore the most alarming appearance; the prisons of Newgate, the King's Bench, and the Fleet were burnt and the prisoners set at liberty, and most of them joined the insurgents. The Popish chapels, and a great number of private houses of Catholics, were set on fire; and thirty six fires were seen blazing at one time in various parts of the metropolis. Military interference became absolutely necessary, when many of the rioters were killed; 135 were brought to trial, of whom 59 were convicted, and upwards of 20 of the most active were executed in various parts of the town, but immediately contiguous to the scenes of their respective depredations.

During the year 1792, and the two following years, the metropolis was greatly agitated by political contention; many associations were formed for the purpose of obtaining a more pure and equal representation of the people. The two principal of these associations, *viz.* the Friends of the People, and the Corresponding Society, held their meetings in London. Their avowed object was parliamentary reform; but they were stigmatized by their enemies with the appellations of Republicans and Levellers. Some of the most active and powerful leaders of these associations were at length arrested, and tried for high treason, but after a long investigation all were acquitted. Other persons, among whom was Thomas Paine, were prosecuted for sedition, and some were imprisoned. Paine was pronounced guilty of writing and publishing the second part of the Rights of Man, which was declared seditious, and the author having left the kingdom, was outlawed. The numerous clubs, debating societies, and political associations formed in the metropolis soon after the revolution in France, and during the early stages of the war against that country, constitute a prominent epoch in the history of the metropolis. The country was hurried on to the very brink of revolution; but this great crisis was prevented by the vigilant, powerful, and determined conduct of the Pitt administration. An Alien act was passed in 1793; the Habeas Corpus act was suspended in the next year; and various arbitrary and oppressive measures were adopted by the ministry to preserve public tranquillity, but at the same time abridge the rights of the British subjects.

The year 1797 was distinguished by the stoppage of bank payments in specie, as the government had employed nearly all the current coin in remittances to the emperor of Germany and to other foreign powers. An act of parliament was now passed to allow the bank to issue notes under five pounds. At the commencement of 1798 a numerous meeting of the bankers, merchants, and traders of London, was held in the Royal Exchange for the purpose of raising a voluntary subscription for the public service. In the course of four days the common council alone subscribed 10,000*l.*, 200,000*l.* was subscribed by the bank, considerable sums were given by other public companies, and 20,000*l.* was advanced by his majesty. The minister estimated this subscription at one million and a half, but the total amount was more than two millions of money. Continued threats of invasion from France induced the minister to adopt some new mode of defence; and several armed associations were

formed by different parishes and companies in the metropolis. On the 4th of June, 1799, all these volunteers were assembled in Hyde Park, and reviewed by his majesty, the princes, &c. The total number under arms was 8989, of which 1008 were cavalry. On the 21st of the same month, a still greater number of volunteers was dispersed through the streets, squares, and suburbs of the metropolis, to be inspected again by the king, and a numerous retinue of princes, dukes, &c. It is stated, that 12,208 volunteers were then drawn out under arms. A similar review of the volunteers to the former, took place on the 4th of June 1800. On the ratification of preliminaries of peace in October, 1801, the metropolis was brilliantly illuminated, and all classes of people testified great joy at the event. The definitive treaty was signed on the 27th of the following month, and the illuminations throughout London were now singularly splendid and general. A war again broke out, and an act of parliament was passed to enable his majesty to arm the people *en masse*. Other acts for increasing the military force of the country were also passed. The cities of London and Westminster, and parishes immediately adjacent, raised a volunteer force amounting to 27,077 men. A patriotic fund was established in London in July 1803, and before the end of August more than 152,000*l.* were subscribed; towards which the city, in its corporate capacity, gave 2500*l.* The successive deaths of lord Nelson, Mr. Pitt, and Mr. Fox, produced great sensation in the metropolis, and many changes in the legislative officers. Covent Garden theatre and several contiguous houses were consumed by fire in September 1808; another fire in January 1809, destroyed part of the king's palace at St. James's, and a third fire, in February of the same year, consumed the whole of Drury-lane theatre. The October of 1809 is memorable in the annals of London, for the circumstance of his majesty's entrance into the fiftieth year of his reign, and the loyal rejoicings, or public manifestations of loyalty that were displayed on the occasion. The memorable and unpropitious expedition to Walcheren, the theatrical riots at Covent Garden theatre, the investigation, before the house of commons, relating to the duke of York and a noted prostitute of the name of Clarke, the arrest and imprisonment of sir Francis Burdett, a member of the house of commons, are all memorable events in the local history of London, and are entitled to particular narration and exposition in a publication devoted to the topography of the metropolis. In Brayley's Survey, already referred to, these subjects are particularized and elucidated. It is conjectured that within the last forty years, 40,000 new houses at least have been erected in London and its connected environs, and that these afford habitation for nearly 200,000 new inhabitants. In July, 1794, a fire broke out in Radcliffe highway, and consumed 630 houses, with much other property. Many of the inhabitants fixed tents in the open fields, where they lived for several weeks till new houses were erected.

History of the Commerce of London.—

“Then COMMERCE brought into the public walk
The busy Merchant; the big Warehouse built;
Rais'd the strong Crane; choak'd up the loaded Street
With foreign Plenty; and thy Stream, O Thames,
Large, gentle, deep, majestic king of floods!
Chose for his grand resort.” Thomson.

London is universally acknowledged to be the first commercial, as well as the first manufacturing city in the world. Considering, therefore, the intimate connection that subsists between its trading prosperity and the general interests of the empire; the subject of this section cannot fail to be highly

highly interesting and important. To trace the steps by which London has risen to its present opulence and grandeur, is in fact to develop the sources of that distinguished rank which England now holds among the nations of the earth.

London was, doubtless, a place of considerable trade at a very early period. Tacitus speaks of it as the *nobile imperium* of his time; the great resort of merchants, and though not a colony, famous for its commercial intercourse. After this, little is known of it, in respect to trade, until the close of the second century of the Christian era, when it is again mentioned as having become "a great and wealthy city." In the year 359, it is said of England, that its "commerce was so extended, that 800 vessels were employed in the port of London for exportation of corn only." Three centuries afterwards Bede styles it "an emporium for many nations repairing to it by land and sea." Fitz-Stephen, who lived in the reign of Henry II. says, that "no city in the world exports its merchandize to such a distance as London;" but does not inform us what goods were exported, or to what countries they were carried. Among the imports, however, he enumerates gold, spices, and frankincense from Arabia; precious stones from India; and palm-oil from Bagdad. But it seems more reasonable to suppose these were obtained through the medium of the trading cities of Italy, than by direct commerce to the respective places. William of Malmbury, who likewise lived about this period, calls "London a noble city, renowned for the opulence of its citizens," and "filled with merchandize brought by the merchants of all countries." The same author adds, "that in case of scarcity of corn in other parts of England, it is a granary, where it may be bought cheaper than any where else." Thus it will be perceived, that even in the infancy of European commerce, and at a time when ignorance and barbarism clouded almost every portion of the world, this city had made no inconsiderable progress towards its present celebrity and importance.

In the year 1220, the merchants of Cologne, in Germany, probably in consequence of an invitation from king John in 1203, established a hall or factory in London, which shortly after became the general factory of all the German merchants resident in the city. Not long subsequent to this period, viz. in 1245, sea coal "*carbone maris*," is mentioned among the articles of inquisition into trespasses committed in the king's forests. Hence it may reasonably be inferred, that coal was not only known and wrought before this time, but actually formed a part of the imports of London. Sea-coal lane, in this city, was certainly so named as early as the year 1253, and according to Stow, received this appellation from lime being burnt there with sea-coal.

The close of the thirteenth century appears to have been a remarkable era in the commercial history of London. In 1296, the company of merchant-adventurers was first incorporated by Edward I. The Hanseards, or Hanse merchants, also received considerable privileges about the same time. In the year 1498, when all direct commerce with the Netherlands was suspended, this body obtained very great advantages over the merchant-adventurers by importation of vast quantities of those articles, through the medium of the Hanse towns, which before had come directly from the Netherlands, where the trade of the latter company had been chiefly established. In consequence of these circumstances, the warehouses of the merchants were attacked and rifled by the mob; but the offenders were soon suppressed, and many of them punished.

In the year 1504, all the ancient privileges of the Hanse, or as they were likewise called, Steel-yard merchants, were

confirmed to them by statute, and all the previous acts which had been made in derogation of them were annulled. A similar charter was also obtained by the English merchants "trading in woollen cloths of all kinds to the Netherland," in which they are for the first time styled the "Fellowship of merchant-adventurers of England." This act strictly prohibited the Steel-yard association from interfering with their trade, by carrying cloths to any of their settlements in the Low Countries. Notwithstanding these unfavourable clauses, however, the Hanse-merchants seem to have engrossed the chief trade of the city. Grievous accusations were consequently made against them, for their proceedings were considered as tending to ruin the commerce of the native English. The city of London at length instituted an action, in the Star-chamber, against them, the object of which was to deprive them of their privileges as a body. Accordingly, in the year 1597, a decree was obtained, annulling their association, and ordering them, under severe penalties, to quit the kingdom. See *HANSE TOWNS*.

But to return: it may be proper to remark, that during the contentions between the houses of York and Lancaster, the commerce of London was very considerably retarded. In the reign of Henry VII. it again began to make rapid progress. Still, however, if credit is to be given to Wheeler's "*Treatise on Commerce*," published in 1601, the trade of this city must have been very low indeed, even as late as the year 1539; for that author expressly avers, that sixty years before he wrote, there were not above four merchant vessels exceeding 120 tons burthen in the river Thames. Nor would it appear that they had increased much in the next reign, if we are to believe the report of a London merchant, who, in a letter to sir William Cecil says, that there is not a city in Europe "having the occupying that London hath, so slenderly provided with ships."

Notwithstanding these complaints, however, it is undoubtedly a fact, that a spirit of enterprise was very general among the merchants about this period. For, in 1553, we find a great geographical and mercantile discovery made by a company, consisting of 240 shareholders, instituted for the purpose of prosecuting discoveries under the direction of Sebastian Cabot, a merchant of Bristol. (See *CABOT, SEBASTIAN*.) This association having fitted out three ships, one of them accidentally fell into the bay of St. Nicholas, in the White seas, and landing at Archangel, obtained from the czar of Russia peculiar privileges of trade with the subjects of his dominions. Within a few years after, the London merchants had also factors settled at the Canaries. The Russia or Muscovy merchants were incorporated in the reign of Philip and Mary, and had their charter subsequently confirmed by Elizabeth, in her eighth year. This princess, likewise, obtained an exclusive grant to the English of the whole foreign commerce of that extensive empire, which they continued to enjoy for a considerable period. About this time the civil dissensions in Flanders began, upon which a vast number of families from the Netherlands flocked to London, and brought over with them their trade and riches. This great addition to the population of the city, and the consequent increase of its commerce soon after, led to the erection of the Royal Exchange, by the celebrated sir Thomas Gresham, in the years 1566 and 1567. (See *ROYAL EXCHANGE*.) Previous to this the merchants were accustomed to meet twice every day in Lombard-street, without any other refuge from the severities of the weather but what the neighbouring shops might occasionally afford. In 1579, the Levant, or Turkey Company, was established, as was also the Eastland Company; both of which still exist, but the former only retains any degree of importance. On the

L O N D O N.

31st of December, 1600, the queen granted the first patent to the East India Company. Their stock then amounted to 72,000*l.* and with this sum the company was enabled to fit out four ships under the command of James Lancaster. The adventure proving successful, the company continued its exertions, and hence has arisen the most splendid and powerful mercantile association that probably ever existed in the world. (See COMPANY, *East India*.) Assurance and insurance companies were now established in London. An act was passed in 1601 for regulating the business of assurance, and a standing commission of merchants appointed to meet weekly "at the office of insurance on the west side of the Royal Exchange." (See INSURANCE COMPANIES.) The company of Spanish merchants were likewise among the number of those incorporated by Elizabeth, so that the reign of that princess may be justly said to form a grand era in the commercial history of this metropolis.

In the reign of James I. the progress of the foreign trade was rapidly increased. Tobacco, which had first been introduced in 1565, now became a considerable article of import. (See TOBACCO.) The tonnage and number of the shipping in the port of London were greatly augmented about this time. Many of the patents granted by Elizabeth were annulled, and the trade thrown open. Howe, speaking of the foreign commerce of this city in the year 1614, says, "London, at this day, is one of the best governed, most richest, and flourishing cities in Europe; plentifully abounding in free trade and commerce with all nations; richly stored with gold, silver, pearl, spice, pepper, and many other *strange* commodities from both Indies; oyles from Candy, Cyprus, and other places under the Turk's dominion; strong wines, sweet fruits, sugar, and spice, from Grecia, Venice, Spayne, Barbaria, the islands and other places lately discovered and known; drugs from Egypt, Arabia, India, and divers other places; silks from Persia, Spayne, China, Italy, &c.; fine linen from Germany, Flanders, Holland, Artois, and Hanault; wax, flax, pitch, tarr, malkes, cables, and honey, from Denmark, Poland, Swethland, Russia, and other northern countries; and the superfluity in abundance of French and Rhenish wines, the immeasurable and incomparable increase of all which coming into this city, and the encrease of houses and inhabitants within the terme and compasse of fifty years, is such and so great, as were there not now two-thirds of the people yet living, having been eye-witnesses of the premises and bookes of the custom-house, which remain extant, the truth and difference of all things afore-mentioned were not to be justified and believed." Howe's edition of Stow's Annals of England, p. 868.

Among the circumstances which occasioned the vast increase of trade during this reign, may be reckoned the colonization of America and the West India islands. The new discoveries, likewise, which were every day made in different quarters of the world, no doubt had a powerful effect in stimulating numbers of speculating persons to commercial exertion and adventure.

During the peaceful years of Charles I. the commerce of this metropolis still continued to make rapid progress; and though the civil wars, for a time, had a very contrary operation, yet in the end they certainly proved beneficial. The energies of the mind were more awakened; the habits of thinking and modes of action, which then became general, taught man to feel his dignity as an individual; the different ranks of society were more closely drawn together; the exertions of industry were better directed; and the means of acquiring wealth greatly augmented. The injurious tendency of monopolies was eminently counteracted; for,

though never abolished by any direct statute, men, regardless of the prerogative whence they were derived, gradually invaded the privileges they conferred, and commerce was increased by the increase of liberty.

The augmented commerce of the port of London, in this reign, may in some measure be estimated by the quota of ship-money, which Charles I. imposed on the city in 1634. By one writ, the citizens were ordered to fit out and equip, at their own charge, for 26 weeks, one ship of 920 tons and 930 men, one of 800 tons and 260 men, four of 500 tons each and 200 men, and one of 300 tons and 150 men. Next year they were commanded to provide two ships of 800 tons and 320 men each. About this time, or at least very shortly before, prices-current were first printed. In 1635, an order was issued by the king in council to the "post-master of England for foreign parts," requiring him to open a regular communication, by running post between the metropolis and Edinburgh, Ireland, and a variety of other places.

Previous to the year 1640, it was usual for the merchants to deposit their cash in the Tower mint; but this deposit now lost all its credit by the ill-advised measure of a forced loan, which the king thought proper to make. The merchants, in consequence, found themselves obliged to trust their money to their apprentices and clerks. The circumstances of the times and opportunity holding forth great inducements to frauds, many masters lost at once both their servants and their money. Some remedy became necessary; and the merchants now began to lodge cash in the hands of the goldsmiths, whom they also commissioned to receive and to pay for them. Thus originated the practice of banking: for the goldsmiths, soon perceiving the advantages that might be derived from disposable capital, began to allow a regular interest for all sums committed to their care; and, at the same time, they commenced the discounting of merchants' bills at a yet superior interest than what they paid. (See BANK and BANKING.) In 1651 the celebrated navigation act was passed, the wise provisions of which have no doubt contributed much to promote our naval and commercial greatness. This same year, coffee was introduced into London by a Turkey merchant named Edwards. (See COFFEE.) The sugar trade was now likewise established; and upwards of 20,000 cloths were sent annually to Turkey, in return for the commodities of that country.

The plague, which made such dreadful havoc among the citizens in 1665, almost wholly suspended the commerce of London; inasmuch that scarcely a single foreign vessel entered the port for the space of three years. The great fire, which happened in 1666, likewise occasioned incalculable loss to numbers of the most opulent merchants in the city. Notwithstanding these disastrous events, however, the spirit of the survivors, so far from sinking, was roused to uncommon exertions. In the course of a few years, the city rose from its ashes with greater magnificence and splendour. India muslins were first worn in 1670, and soon became prevalent. In this year also was the Hudson's Bay Company established, with very extensive powers. The Greenland Fishing Company was incorporated in the year 1693; and the institution of the Bank of England rendered the succeeding one justly memorable in the commercial annals of London. See COMPANY.

The commerce to the East Indies having become vastly enlarged, and many disputes arising relative to exclusive trade, a new joint stock company was incorporated in London, in the year 1698, by the name of "The English Company trading to the East Indies." The existence of two rival companies having the same privileges, however,

fool gave birth to numerous absurdities and contradictory questions of right. These circumstances, and some others which it is unnecessary to detail in this place, eventually produced the consolidation of both into one, in the first and seventh years of queen Anne, by the title of "The United Company of Merchants trading to the East Indies." See COMPANIES, *English, the East India*, vol. ix. for a full account of this establishment.

The number of vessels belonging to the port of London, as appears from returns made to circular letters from the commissioners of the customs, amounted, in 1701, to 560; carrying 84,882 tons and 10,065 men. In 1710 the customs of this city are stated at 1,268,005*l.*, and those of all the out-ports only at 346,081*l.*, which is more than three and a half to one. The following year beheld the incorporation of the South Sea Company, afterwards to baneful in its effects to numerous individuals, and so generally hurtful to the commercial enterprise of the country at large. The Royal Exchange Assurance and the London Assurance Companies were chartered about the same time.

During the reign of George I. the trade of London made very little, if any, progress. The failure of the South Sea scheme, the rebellion in Scotland, and the Spanish war, were the combined causes which operated to produce its retardation. In the year 1732, however, commerce began again to revive; but its advances continued comparatively slow, till the peace of Aix-la-Chapelle in 1748, after which it extended with uncommon rapidity. The next considerable check it sustained was the result of the American war. No sooner, however, was peace signed than it proceeded with renewed vigour. The grievous consequences which many persons apprehended to our trade, from the declaration of the independence of the United States, were only imaginary. For, even so soon after that event as the year 1784, the value of exports to America only had increased to 3,397,500*l.*, somewhat more than 332,000*l.* above the greatest amount in any one year before the war. The net sum of duties levied in the port of London, and paid into the exchequer this year, arose to the vast sum of 4,472,001*l.* 13*s.* 3*d.* From this period to 1793, when the French revolution began, the commerce of London continued uniformly increasing. In that year, however, the value of exports was upwards of two millions less than in the preceding year; though the imports scarcely suffered any diminution. Numerous bankruptcies consequently took place; but the timely interference of the legislature, and the voting of exchequer bills to the amount of 5,000,000*l.* for the use of such persons as could give sufficient security, soon checked the growing distress.

In the course of the three succeeding years, the appearance of things was entirely altered. In 1796 the exports of London amounted in value to 18,410,499*l.* 17*s.* 9*d.*, and the imports to 14,719,460*l.* 15*s.* 7*d.* The number of British ships that entered the port amounted to 2007, carrying 436,343 tons; and 2169 foreign vessels, carrying 287,142 tons. The total entering coastwise was 11,176, including repeated voyages, which made a tonnage of 1,059,915. The following year, some alarm was spread among the merchants by the stoppage of the bank payments *in specie*; but, through the intervention of parliament, confidence was soon restored. The net amount of the customs was 3,950,608*l.* In 1798 the importations of sugars and rum far exceeded those of any preceding year, as did likewise the revenue of the customs, which amounted to the sum of 5,321,187*l.* 7*s.* 3*d.* In 1799 it had increased to 7,226,353*l.* 0*s.* 1*d.*, West India 4*l.* per cent. duty included; but next year fell to 6,468,655*l.* 13*s.* 7*d.* The official

value of the imports, in 1800, was 18,543,172*l.* 2*s.* 10*d.*; and of the exports, 25,428,922*l.* 16*s.* 7*d.* Their real value amounted in all to 68,000,000*l.*, nearly two-thirds of the value of the whole trade of the kingdom. The number of vessels belonging to the port in that year appeared, from official documents laid before parliament, to be 2666, carrying 568,202 tons, and 47,402 men. Comparing this number with the number returned in the beginning of the last century, the increase will be seen to be astonishing. On the quantity of tonnage, it is nearly in the proportion of six to one; and on the amount of men and ships, as upwards of four to one. The East India Company's ships alone carry more burthen, by 21,166 tons, than all the vessels of London did a hundred year ago. The average number of ships in the Thames and docks is 1100, together with 3000 barges employed in lading and unlading them, 2288 small craft engaged in the inland trade, and 3000 wherries for the accommodation of passengers; 12,000 revenue officers are constantly on duty in different parts of the river; 4000 labourers are employed in lading and unlading, and 8000 watermen navigate the wherries and craft. See DOCKS and COMPANIES.

The Port of London, as actually occupied by shipping, extends from London bridge to Deptford, being a distance of nearly four miles, and from four to five hundred yards in average breadth. It may be described as consisting of four divisions, called the Upper, Middle, and Lower Pools, and the space between Limehouse and Deptford: the Upper Pool extends from London bridge to Union Hole, about 1600 yards; the Middle Pool, from thence to Wapping New Stairs, 700 yards; the Lower Pool from the latter place to Horse-ferry Tier, near Limehouse, 1800 yards; and the space below to Deptford about 2700 yards. When the house of commons commenced an investigation respecting the port of London, the land accommodations were found to consist of only the legal quays and the sufferance wharfs. The former were appointed in the year 1558, under a commission from the court of exchequer, authorized by an act of the first year of Elizabeth, for the exclusive landing of goods, subject to duty: they occupy the north bank of the river Thames, with some interruptions, from London bridge to the western extremity of Tower ditch; the whole frontage measuring about 1464 feet. Till of late years these quays constituted the whole legal accommodation for the prodigious shipping trade of London; though from the increased size and tonnage of merchant vessels, &c. the depth of the river in this part was found too shallow to admit of that speedy clearance which the trading and mercantile interests require. The commissioners of the customs, therefore, occasionally permitted the use of other landing places, which were thence called sufferance wharfs, and of which five were situated on the north side of the river, between the Tower and Hermitage Dock, and eighteen on the opposite side: the whole having a frontage of 3576 feet. Notwithstanding these additional conveniences, the whole number of quays was still very far from possessing sufficient accommodation for the increased trade; and more especially in times of war, when large fleets of merchantmen arrive at once. The numerous evils arising from this want of a sufficient space for shipping and landing goods, and among which, the monopoly thrown into the hands of the few legal quays was not the least, were for many years subjects of vexation and complaint. So long ago as 1674, the merchants of London petitioned the house of commons for redress against a combination, which the whole body of wharfingers had entered into; and in the year 1711, when the tonnage of the vessels belonging to London did not amount to one-third

part of what it does now, the commissioners of the customs recommended to government to make a legal quay at Bridge yard, on the south side of the river; but it was never executed. About the year 1762, the court of exchequer directed a part of the Tower wharf to be converted into a legal quay; but this plan was relinquished. The construction of Wet docks had been recommended as the best expedient for obviating the vast loss and embarrassment arising from the encumbered state of the quays and wharfs, and from the immense crowding of the vessels on the river; and through the various schemes which were about this time offered for the purpose, &c. the house of commons was induced to appoint a committee; the business of which has been to inquire into the best mode of improving the port, and render it completely adequate to the present and probable commerce of London. The most skilful engineers and surveyors have been employed; whose reports, plans, &c. with the opinions and statements of various merchants and other persons, have been printed by order of the house of commons. These reports constitute several volumes in folio; and are peculiarly interesting and curious. Sir Frederic Eden published a pamphlet on the same subject, entitled "*Porto-Bello, or a plan for the improvement of the port and city of London; illustrated by plates.*" 8vo. 1798. For a particular account of the various branches of commerce, commercial companies, and other objects connected with the same, the reader is referred to the words *DOCKS, COMPANIES, EAST INDIA Trade, WEST INDIA Trade.*

Custom House.—On the north bank of the Thames, west of the Tower, is a large building, appropriated to such officers, clerks, tide-waiters, &c. as are immediately concerned in receiving the king's duties on the exports and imports of commerce. The present building was erected in 1718, on the site of another which had been destroyed by fire. It is 260 feet in front; and when erected was deemed amply sufficient for its destination. It has proved, however, very inadequate to the increased customs and business of the port; and to the vast commerce of London. After various surveys and reports made on the subject, it has been recently determined by the commissioners of the customs, that a new custom-house shall be erected, upon such a scale, and provided with such numerous and various accommodations, as to meet the exigencies and demands of government. Mr. David Laing, architect to the customs, having furnished designs for a new edifice, and the same being approved, it is intended to proceed with the building immediately. The site is from the western side of the present edifice to Billingsgate quay; and its whole extent will constitute a range of 480 by 96 feet. In the centre is to be the long room, of 190 feet by 67. The whole building will accommodate 650 officers and clerks, the number employed here; also 1050 tide-waiters, and other inferior servants. The lower floor is to consist of bondage vaults, over which are to be numerous apartments for officers and offices; and above these are to be several others, with the long room already noticed. The water front is to be of stone, with Ionic columns at each wing, and the centre will be crowned with a large dome over the long room, with sky-lights and ventilators. It is but justice to say that the designs are creditable to the taste and science of the architect. The quay in front of the building is to be enlarged by filling up a part of the river. A new wall and quay are to be formed from the Tower to Billingsgate wharf, and numerous improvements will be made in the contiguous streets and lanes. The river, at this place, is about 20 feet deep at high water mark. The business of the customs is managed by nine commissioners, whose jurisdiction extends over all the ports of England.

Manufactures of London.—London has long been celebrated for its manufactures as well as for its commerce. In the year 1327 the Skinners were a very numerous and rich class of citizens, manufacturing "fables, lucerns, and other rich furs." Cloth-workers of different kinds were also noted for the excellence of their goods. In 1556 a manufactory for the finer sort of glasses was established in Crutched Friars, and flint glass, not exceeded by that of Venice, was at the same time made at the Savoy. About five years subsequent the manufacture of knit stockings was introduced by one William Rider, an apprentice in London, who happening to see a pair from Mantua at the house of an Italian, made another exactly similar to them, which he presented to William earl of Pembroke. (See *HOSE and STOCKINGS.*) A manufacture of knives was shortly after begun by Thomas Matthews of Fleet-street, and this has ever since been a flourishing trade. Silk stockings were first made in England in the reign of queen Elizabeth. In the fourth year of that princess, "John Rose, dwelling in Bridewell, devised and made an instrument with wyer stringes, called the Bandora, and he left a son far excelling him in making bandoras, viol de gambles, and other instruments." Coaches were introduced in 1564, and in less than 20 years became an article of great manufacture. The following year the manufacture of pins was established, and shortly after that of needles. The making of "earthen furnaces, earthen fire-pots, and earthen ovens, transportable," began about the tenth year of Elizabeth, one Richard Dyer, an Englishman, having brought the art from Spain. Women's masks, busks, musins, fans, bodkins, and periwigs were introduced and made in London shortly after the massacre at Paris in the year 1572, and in 1577 pocket watches were brought from Nuremberg in Germany, and the manufacture of them almost immediately commenced. In the reign of Charles I. saltpetre was made in such quantity, as not only to supply all England, but the greater part of the continent. The manufactures of silk had likewise become extremely prevalent, as well as the manufacture of various silver articles. The printing of calicoes commenced here in 1676, and about the same time the weavers' loom was introduced from Holland. The revocation of the edict of Nantes in 1685, having driven many industrious Frenchmen from their native land, a considerable number came over to England and settled in Spitalfields. By them several of our manufactures, but particularly that of silk, were greatly improved, and many others introduced. Since then the productions of London have greatly increased both in extent and value. They now consist chiefly of fine goods, and articles of elegant use, brought to the greatest perfection, such as cutlery, jewellery, articles of gold and silver, japan ware, cut glass, books, cabinet work, and gentlemen's carriages; together with such particular articles as require a metropolis, or a port, or great mart for their consumption, export, or sale; viz. porter, English wines, vinegar, refined sugar, soap, &c. The silk manufactories of Spitalfields, Shoreditch, and Bethnal-green parishes alone employ upwards of 7000 persons. In Clerkenwell a like number are engaged in the different branches of watch-making. Coach builders and harness makers are very numerous, and have brought their respective works to a higher degree of perfection and elegance than any in the world. Intimately connected with this subject is the

Trade of London. which is vast, various, and of extensive effect. It may be divided into the wholesale and retail business; for these are different, and under different systems of management. The great number and variety of shops that are dispersed over the metropolis, the diversity, richness, and multitude of articles displayed for sale, and the great concourse

course of persons immediately and collaterally dependent on, and intimately connected with the same, are calculated to excite the astonishment of foreigners, and of persons who have not made inquiries into the subject. The whole-sale trade is mostly carried on in the city, and in the vicinity of the river, where large warehouses and counting-houses are established. The retail trade is dispersed through all the public streets: where spacious and handsome shops are opened for the display of all the necessities, as well as all the luxuries of life. The shop-keepers of London are mostly an active, industrious and respectable class of society: many of them are wealthy, and frequently retire from business in advanced age, with competence, or fortunes. Among the most modern shop establishments upon a large scale, are those appropriated to books and prints. Within the last 50 years, these have been prodigiously increased: and it would greatly astonish Addison, Johnson, or Sir Joshua Reynolds, could they revisit London in 1812, and take a review of the change that has been produced since the time they lived, in the quantity and quality of literary productions, and in works of art. The regular, continued and perpetual intercourse that subsists between London and all parts of the kingdom, by coaches, waggons, barges, &c. constitutes another and strongly marked feature.

Provisions, &c. used in London.—An immense population will require a large and systematic supply of provisions; and in this respect, no city in the world can be better accommodated; laws, custom, and open competition are all conducive to public advantage.

Animal Food.—The number of oxen annually consumed in London is estimated at 110,000; of sheep, 770,000; of lambs, 250,000; of calves, 250,000; of hogs and pigs, 200,000; besides animals of other kinds. In speaking of the consumption of animal food in London, it is not sufficient to notice merely the number of animals brought to market; for their size and fine condition should also be considered in forming a proper criterion. The increased consumption of the metropolis, from its accumulating population, may be estimated from the following average of the number sold annually in Smithfield.

	Oxen.	Sheep.
From 1750 to 1758	75,331	623,501
1759 — 1767	83,432	615,328
1768 — 1776	86,362	627,805
1777 — 1785	99,285	687,588
1786 — 1794	108,075	707,456

It is not only in number but in weight that there has been an astonishing increase; this has arisen from the improvements in breeding that have taken place in the course of the last century. About the year 1700, the average weight of an ox, killed for the London market, was 370lbs.; of a calf, 50lbs.; of a sheep, 28lbs.; of a lamb, 18lbs.; whereas the average weight at present is, of oxen, 800lbs. each; of calves, 140lbs. each; of sheep, 80lbs. each; and of lambs, 50lbs. each. The total value of butchers' meat sold in Smithfield is calculated to amount to 7,000,000*l.* *per annum.*

Milk.—The quantity of this article consumed in London surprises foreigners; and yet few persons have even a suspicion of the amount, which is not less than 6,080,000 gallons annually. The number of cows kept for this supply is said to be 8500; the sum paid by the retailers of milk to the cow-keepers is valued at 317,400*l.* annually, on which the retailers lay an advance of *cent. per cent.*, making the cost to the inhabitants 634,000*l.* Not content with

this profit, the retailers add water to the milk, to the extent, on an average, of a sixth part. Though the cow-keepers do not themselves adulterate the milk, (it being the custom for the retailer to contract for the milk of a certain number of cows, to be milked by his own people,) yet they are not wholly to be acquitted of the guilt; for in many of the milk-rooms where the milk is measured to the retailer, pumps are erected for the express purpose of furnishing water for headulteration, which is openly performed in the presence of any person who happens to be on the spot. See MILK.

Vegetables and Fruit.—There are at least 10,000 acres of ground near the metropolis, cultivated wholly for vegetables, and about 3000 acres for fruit. The sum paid at market annually is about 645,000*l.* for vegetables, and about 400,000*l.* for fruit; independently of the advance of the retailers, which, on an average, is more than 20*l. per cent.*, making the entire cost for the London supply upwards of 3,000,000*l.*

Wheat, coals, &c.—The annual consumption of wheat in London is, at least, 900,000 quarters, each containing eight Winchester bushels; of coals 800,000 chaldron, 36 bushels, or a ton and half to each chaldron; of ale and porter 2,000,000 barrels, of 36 gallons each; spirituous liquors and compounds 11,146,782 gallons; wine 65,000 pipes; butter about 21,265,000lbs.; and cheese, 25,500,000. The quantity of porter brewed from July 5, 1809, to July 5, 1810, by two of the principal brewers, was, by Barclay, Perkins, and Co. 235,053 barrels, and by Menx, Reid, and Co. 211,009. (See PORTER.) The quantity of fish consumed in the metropolis comparatively small, on account of the high price which it generally bears; and this appears to be the most striking defect in the supply of the capital, when it is considered that the rivers of the kingdom, and the seas which surround it, must afford such an amazing quantity. There are, on an average, annually brought to Billingsgate market 2500 cargoes of fish, of 40 tons each, and about 20,000 tons by land-carriage, in the whole 120,000 tons. The supply of poultry being inadequate to a general consumption, and the price consequently exorbitant, this article is confined to the tables of the wealthy, and the annual value does not exceed 60,000*l.* Game is not publicly sold, yet a considerable quantity, by presents, and even by clandestine sale, is consumed by the middling classes. Venison is sold, chiefly by pastry-cooks, at a moderate rate; but the chief consumption, which is considerable, is amongst the proprietors of deer parks.

Markets, &c.—London contains 15 flesh markets, one for live cattle, sheep, horses, &c. and 25 for corn, coals, hay, vegetables, &c. Of these the principal are, at Smithfield, for bullocks, sheep, horses, swine, hay, straw, &c.; Leaden-hall, for butchers' meat, wool, hides, &c.; Billingsgate, for fish; Covent garden and Fleet, for fruit and vegetables; Newgate, Newport, Carnaby, and Clare markets, for butchers' meat, &c.; the corn market in Mark-lane: in Thames street is a coal exchange. London has only one annual fair, which is held in Smithfield, and continues for three days. It is mostly devoted to objects of amusement, such as shows, exhibitions of beasts, birds, flights of hand, and the very lowest species of diversion. Hence it is mostly frequented by the lowest and most depraved classes of society. It is become more a place of riot and debauchery, than of public utility.

From what has been stated respecting the provisions annually consumed in London, we are naturally led to inquire into its population; an accurate knowledge of which forms

a foundation for much curious speculation. In the following table we are enabled to give the total number of persons at four different periods; but it may be necessary to premise, that the last is presumed to be the most correct census ever taken in London.

Population.—London is less populous, for its extent, than many other great cities. The streets are wider, and the inhabitants of every class, below the highest rank, enjoy more room for themselves and families than is usual for the same classes in foreign countries. Hence a given number of people is spread over a larger space in London than in foreign

cities. From the report on the population of Great Britain, published on the authority of an act passed 43 G. III. London, including the suburbs, appears to contain 837,906 settled inhabitants; but the great number of soldiers, mariners, provincial visitors, colonists, and foreigners, who are constantly in London, for purposes of pleasure and business, and the new inhabitants of 10,000 houses built within the last seven years, extends the total population to more than a million. As the increase or diminution of the population claims a distinct notice, the following table will shew its five divisions, at four different periods.

	In 1700	1750.	1801.	1811.
1. City of London, within the walls - - - - -	159,300	87,000	78,000	80,000
2. City of London, without the walls, including the Inns of Court - -	169,000	156,000	155,000	168,000
3. City and Liberties of Westminster - - - - -	130,000	152,000	165,000	180,000
4. Out-parishes within the Bills of Mortality - - - - -	226,900	258,900	379,000	460,000
5. Parishes not within the Bills - - - - -	9,150	22,350	12,300	135,000
Total population of the Metropolis - - - - -	674,350	675,250	900,000	1,023,000

Government of London.—In tracing the outline of the present government of this metropolis, it will be proper to divide it into three principal parts; viz. the city of London, with its dependencies; the city and Liberties of Westminster; and the suburbs connected with the two, but out of the jurisdiction of both the cities.

The civil government of the city of London is vested, by charters and grants from the kings of England, in its own corporation or body of citizens. The city is divided into 26 principal districts, called wards; and the corporation consists of, 1, the lord mayor; 2, the aldermen; and 3, the common council. The lord mayor is chosen annually in the following manner: on the 29th of September, the livery, in Guildhall or common assembly, choose two aldermen, who are presented to the court of lord mayor and aldermen, by whom one of the aldermen is chosen, (generally the senior,) is declared lord mayor elect; and on the 9th of November he enters on his office. The aldermen are chosen for life by the free householders of the several wards, one for each ward; except Bridge-ward without, where the election is by the court of aldermen from among those who have passed the chair, commonly the senior: he is styled father of the city. The common council are chosen annually by the free householders in their several wards, the number for each ward being regulated by ancient custom; the body corporate having a power to extend the number. The common council are the representatives of the commons, and compose one of the parts of the city legislature, which nearly resembles that of the kingdom; for as the latter consists of king, lords, and commons, so this is composed of lord mayor, aldermen, and common councilmen: the principal difference is, that in the three estates of the kingdom each enjoys a separate negative, while in the city this right is denied to the lord mayor, and confined to the aldermen and common council. Before the year 1547, there were only two common-councilmen returned for each ward, which being thought insufficient to represent such a numerous body, it was at that time settled that each ward should choose a number, not more than twelve, or less than six, according to its dimensions; which has since been increased to the present number. The 26 wards are subdivided into 236 precincts, for each of which a representative is elected in the same manner as the aldermen; with this difference,

that as the lord mayor presides in the wardmote, and is judge of the poll at the election of an alderman, so each alderman, in his respective ward, presides at the election of common council men. The civil powers exercised by the corporation are very complete: the laws for the internal government of the city are wholly framed by its own legislature, called the court of common council, which consists of the lord mayor, aldermen, and representatives of the several wards, who assemble in Guildhall as often as the lord mayor thinks proper to convene them. They annually select six aldermen and twelve commoners for letting the city lands, and this committee generally meet at Guildhall on Wednesdays. They also appoint another committee of four aldermen and eight commoners for transacting the affairs of Gresham-college, who usually meet at Mercer's-hall, at the appointment of the lord mayor, who is always one of the number. The court of common council also, by virtue of a royal grant, annually choose a governor, deputy, and assistants, for the management of the city lands in Ireland. This court also dispose of the offices of town-clerk, common serjeant, judges of the sheriffs'-court, common crier, coroner, bailiff of the borough of Southwark, and city garbler. The election of the recorder is vested in the court of aldermen only. The lord mayor is the chief magistrate of the city: and the aldermen are the principal magistrates in their several wards. The lord mayor, the recorder, the common serjeant, and the aldermen, are judges of oyer and terminer (that is, the king's judges to try capital offences and misdemeanors) for the city of London and county of Middlesex; and the aldermen are perpetual justices of the peace for the city. The two sheriffs, (who are strictly officers of the king, for many important purposes of his executive government,) are chosen annually by the livery of London, not only for the city, but for the county of Middlesex, the same persons being sheriffs for London, and jointly forming one sheriff for the county. (See Philips's Letter on the Office of Sheriff, 8vo. and SHERIFF.) The administration, in all its branches, within the jurisdiction of the corporation, in all cases embracing the city and the borough of Southwark, and in some cases extending beyond, is exercised by members of the corporation or its officers. The borough of Southwark was formerly independent of the city of London, and appears to have been governed by

a bailiff till the reign of Edward III., who granted the government of it for ever to the city. A part has been since incorporated with the city, under the appellation of Bridge Ward Without, and has its officers appointed by the court of common-council. The livery is a numerous, respectable, and important elective body; in which is vested the election of the lord mayor, sheriffs, chamberlain, members of parliament, bridge-matters, ale-conners, and auditors of the chamberlain's accounts. The lord mayor, aldermen, common-council, and livery of London, form together the most important popular assembly, the commons house of parliament excepted, in the kingdom. On occasions of the greatest moment, their decisions have inspired general fortitude; and the whole legislature, when under evil influence, has been struck with awe by the remonstrance of the city, and prudently listened to a warning so solemnly pronounced.

The military government of the city of London was considerably changed by an act of parliament passed in the year 1794; under which two regiments of militia are raised in the city, by ballot, amounting together to 2200 men. The officers are appointed by the commissioners of the king's lieutenancy for the city of London; and one regiment may, in certain cases, be placed by the king under any of his general officers, and marched to any place not exceeding twelve miles from the capital, or to the nearest encampment; the other, at all such times, to remain in the city. Regiments of affiliated volunteers are formed in the respective wards and parishes, for the internal defence and peace of the metropolis. A considerable force is also maintained by the Bank, India-house, Custom-house, and other public bodies, for their more immediate security. The Artillery company, which is principally composed of a voluntary enrolment of the younger citizens, affords an additional force of about six hundred men. (See ARTILLERY.) See also Highmore's History of the Artillery Company, 8vo.

The civil government of the suburbs is vested in the justices of the peace for the county. The county-hall for Middlesex is on Clerkenwell-green, where the quarter-sessions are held; and a great part of the civil government is exercised. In Bow-street, Covent-garden, is an office of police, under the direction of certain justices of Middlesex, who dedicate their time chiefly to that office, where are first examined the most serious cases of misdemeanor. The other public offices of police, where magistrates sit daily, are—the Mansion-house and Guildhall, within the city. In the suburbs—Bow-street; Queen-square, Westminster; Marlborough-street; Hatton-garden; Worship-street; Lambeth-street. Whitechapel; High-street. Shadwell; and Union-street, Southwark; at Wapping New-Itairs is an office for enquiry into offences connected with the shipping and port of London.

The police of London is under the controul of the magistrates belonging to these offices; who are appointed and paid by the government. They are required to attend on duty every day, and their province is to hear and determine petty offences, and subjects of dispute between individuals. On many occasions they investigate felonies, and the higher classes of crimes, and commit the offenders to the proper prisons. Different acts of parliament have been passed on this subject, by which the duty and powers of the magistrates and subordinate officers are particularly defined. The police of the city of London is regulated by acts passed in 10 Geo. II. 11, 14, 33, and 34 Geo. III.: of Westminster and its liberties, by acts of 27 Eliz., 16 Cha. I., 29 and 31 Geo. II. 2, 3, 5, 11, and 19 Geo. III.: municipal regulations are also established in the borough of Southwark, by acts 28 Geo. II. and 6 and 14 Geo. III.

Under the foregoing acts, a nightly watch is appointed for the prevention of robbery, and the apprehension of offenders. To the city of London are attached 765 watchmen, and 38 patrols. The whole number of headles, patrols, and watchmen, who are every night on duty in and around the metropolis, is estimated at 2041. Watch-houses are placed at convenient distances in all parts, where parochial constables attend in rotation to keep order, receive offenders, and deliver them the next morning to the sitting magistrate. In the winter season, the roads adjacent to London are additionally guarded by horse-patrols; and on extraordinary occasions, the officers of the police are ordered out, or kept in readiness, to assist in the preservation of the public peace. The nightly watch is of peculiar utility in case of fire, as in every watch-house the names of the turncocks, and the places where engines are kept, are to be found. Besides parochial engines, many public bells are provided with them, and the principal fire-offices have engines stationed in various districts, with active men and horses. By means of the fire-plugs, water is immediately supplied, and the general security is guaranteed by every effort of vigilance and activity.

Acts of Parliament relative to London and its Inhabitants.—

The internal economy, government, police, and civil regulations of London, are entitled to particular and commendable notice; because these have tended to attract foreigners to settle here, and induced numerous families, both tradesmen and persons of fortune, to fix on this city as a desirable place of permanent residence. It will be found that many legislative acts have been passed, and are in force, to secure the safety and comfort, and administer to the luxuries of the inhabitants of this metropolis. Besides numerous local acts of parliament that apply to particular parishes and districts, the following have been passed expressly for the above purposes. It is thought advisable to specify these acts, and point out some of their items; because many local advantages and conveniences of London are to be referred to these legislative provisions.

By 3 Hen. VII. c. 9, citizens and freemen of London are authorized to carry their wares to any fair or market in the kingdom, in spite of any bye-law to the contrary. By 6 Geo. II. c. 22, the lord mayor and citizens were empowered to fill up part of Fleet Ditch, and the inheritance of the ground was vested in them. By 29 Geo. II. c. 20, the lord mayor and common-council were empowered to purchase and remove buildings, to improve, widen, and enlarge the passage over and through London-bridge.

Buildings.—In the year 1764, a very important act of parliament was passed, respecting all buildings which are hereafter to be erected within London, Westminster, the bills of mortality, and the parishes of Mary-le-bone, Paddington, Pancras, and Chelsea, whereby it is provided, that they shall be divided into seven rates, of which the external walls shall be of a thickness proportionate to their rates or sizes; those of first-rate buildings to be at the foundation $2\frac{1}{2}$ bricks, or 1 foot $9\frac{1}{2}$ inches thick, and decreasing upwards in a degree therein specified. Another act, of a more ample nature, was passed in 1774, respecting the buildings of London and its vicinage. By this it is required, that houses contiguous to other buildings shall have party-walls between them, which walls and all chimnies and chimney-shafts shall be of brick or stone, or both together. (See CHIMNEY.) Party-walls shall be 18 inches above the buildings adjoining, and those of first-rate buildings shall be at the foundation $3\frac{1}{2}$ bricks, or 2 feet 6 inches in thickness, decreasing upwards in a given proportion. No recesses to be made in party-walls (except for chimnies, fires, girders,

&c.) so as to reduce such wall under the thickness required. No timber to be in the party-walls (except bonds, templets, and chains, and the ends of girders, beams, &c.) and 8½ inches of solid brick-work to be between the ends and sides of every piece of timber, except opposite to other timbers, and then no part of such timber to approach nearer than four inches to the centre of the wall. Surveyors are to give information of irregular buildings, and the lord mayor and justices are to order the same to be demolished or amended, and 50s. penalty is chargeable on the workman. Fire-engines and ladders to be kept in known places in every parish; and parish officers shall place on the mains of water-works, stop-blocks, and fire cocks, and shall mark the house near. In case of fire, the turncock whose water comes first shall be paid 10s. First engine 1*l.* 10s., the second 1*l.*, the third 10s. Where officers pay rewards for fires in chimneys only, or beginning there, they are to be reimbursed by the occupier. Servants who through negligence set fire to any house, shall forfeit 100*l.* or be committed to hard labour for 18 months.

Butchers.—It is provided by an act of Hen. VII. c. 3, that butchers shall not kill beasts within the walls of London; but this act is either superseded or not put in force.

Cattle.—By 14 Geo. III. c. 87. and 21 Geo. III. c. 67. any peace officer may arrest persons who drive cattle through the streets of London in an improper or cruel manner. The party, if convicted, shall forfeit from 5s. to 20s. or be committed for one month. Persons not being drivers of cattle, who shall throw stones or set dogs at them, shall be subject to the same penalties.

Carts.—By 1 Geo. I. stat. 2. c. 57, no carman, drayman, waggoner, or other person shall, within the bills of mortality, ride on a cart, dray, or waggon, not having some person on foot to guide the same, on forfeiture of 10s. This penalty is extended to within ten miles of London, by 24 Geo. II. c. 43.

Coals.—By 27 Geo. III. sess. 2. c. 68, the coal exchange shall be a free open market on Monday, Wednesday, and Friday, from twelve o'clock till two, and coals are only to be sold in market hours, under a penalty of 100*l.*

Hackney Coaches.—The commissioners may licence 800 by act 9 Anne, 200 more by 11 Geo. III., and 100 more by 42 Geo. III.; total 1100. The rates of fares are fixed, and an office is appointed to determine on complaints, which are also cognizable by magistrates.

Paving, lighting, and cleansing.—Several acts were passed in the reign of Hen. VIII. for paving parts of the metropolis. The eastern suburbs were paved by act 13 Eliz. Various other acts were passed in subsequent reigns for paving the several parts which were added to the metropolis. The *new paving*, according to the present mode, commenced in 1763, under an act passed in the preceding year. Before this period the streets were extremely inconvenient to passengers, the stones (mostly Guernsey pebbles) being round, the kernels in the middle, and no level footway, as at present, for the pedestrians. The alterations first took place in Westminster, and the improvements progressively extended through most parts of the metropolis. The act also took place the removal of the enormous dunghills lying across the streets or over the footways, and the raising of the pavements and manure works, improving the circulation of the air as the progress of the paving.

Lighting.—As early as the year 1416, the inhabitants of London were obliged to hang out lanterns on winter evenings. Among other improvements in the reign of Queen Anne, was the introduction of globular glass lamps

with oil burners, instead of the lanterns with candles, and common lamps that had previously been in use. In 1736, an act of parliament was procured to regulate "the better enlightening the streets, &c." within the city. A committee appointed to carry this act into execution, reported that "the number of houses then inhabited and chargeable (*i.e.* such as were subject to poor-rates) was in all 14, 14, of which 1287 were under the rent of 1*l.* per annum: 4741 of 1*l.* and under 20*l.*; 3045 between 20 and 30*l.*; 1839 between 30 and 40*l.*; and 3092 of 40*l.* and upwards. The number of lamps required was 4200, exclusive of such as were attached to public buildings. They were to be placed at the distance of 25 yards from each other in the principal streets, and 35 yards in the smaller streets and lanes. This was the commencement of the system of defraying the charges of lighting the metropolis by parochial assessments. Since this time various other acts of parliament have been obtained for different districts in the suburbs, and it is conjectured that more than 30,000 lamps are lit every night within the bills of mortality. From Lady-day to Michaelmas, a less number is used than during the other half of the year. In 1737, an act of parliament was passed for regulating and increasing the city watch, &c. Various acts have been passed for cleaning the streets, and preserving them from obstructions and nuisances of every description.

Sewers.—One of the most essential objects in a large city is good drainage; and in this respect London is well provided. Into the deep channel of the Thames, numerous large sewers communicate, and convey all the superfluous water, and vast quantities of filth from the houses. By acts of the legislature, a number of persons, styled commissioners of sewers, are empowered to make and repair sewers, and levy a tax on every housekeeper towards defraying the expences incurred by the same. An act of parliament was obtained as early as the reign of Henry VI. on this subject; and this has been amended and enlarged by subsequent acts, 6th Henry VIII. cap. 10; 23d Henry VIII. cap. 5; and 25th of same reign; afterwards in the 3d and 4th of Edward VI.; 1st of Mary; 13th of Elizabeth; 3d of James, and 7th of Anne. See SEWERS.

By an act of parliament passed in 1737, the number of playhouses was limited to three, and all dramatic pieces intended for the stage, were first to be subjected to the perusal and approbation of the lord chamberlain. See PLAYHOUSE.

The *Charitable Institutions* of London are numerous, of various descriptions, and of incalculable advantage. Whilst they administer comfort, health, education, and protection to the necessitous, they reflect much honour on the affluent, and on all the patrons. These consist of hospitals, dispensaries, almshouses, charity schools, benevolent societies, and other establishments. In a former part of this work, under the word HOSPITAL, will be found accounts of several, to which we shall add a few particulars. In the metropolis are 22 hospitals for sick, lame, and for pregnant women; 107 almshouses for the maintenance of aged persons of both sexes; 18 institutions for the support of the indigent of various other descriptions; above 20 dispensaries for the gratuitous supply of medicine and medical aid to the poor; 45 free-schools with perpetual endowments, for educating and maintaining 3500 children; 17 other public schools for educating poor children; 237 parish schools, supported by voluntary contribution, in which about 9000 boys and girls are constantly clothed and educated: each parish has also a workhouse for the maintenance of its own helpless poor. Exclusive of this ample list, the several livery companies of

the city of London distribute above 75,000*l.* annually in charities; and there is a multitude of institutions, of a less prominent nature than the foregoing, which make the total of charitable donations immense. The sums annually expended in the metropolis for charitable purposes, independently of the private relief given to individuals, have been estimated at 850,000*l.* The hospitals were chiefly founded by private munificence: some are endowed with perpetual revenues, and others supported by annual or occasional voluntary subscriptions. The almshouses were built and endowed either by private persons or corporate bodies of tradesmen. Many of the free-schools owe their origin to the same sources. The magnitude of the buildings dedicated to public charities, and the large revenues attached to them, are highly deserving of commendation; and the general administration of these establishments confers a peculiar honour on the capital. The interior regulations of the hospitals well accord with the exterior magnitude: the medical assistance is the best the profession can supply; the attendance is ample; the rooms are generally very clean and wholesome; and the food is proper for the condition of the patients. The almshouses, and other institutions for the support of the aged and indigent, exhibit not merely an appearance, but a real possession of competence and ease. From some of the free-schools, pupils have been sent to the universities as learned as from any of the most expensive seminaries: and all the scholars receive an education completely adapted to the stations for which they are designed. Among the free-schools may be particularly noted those of Westminster, Blue-coat or Christ's-hospital, St. Paul's, Merchant-tailors', Charter-house, and St. Martin's. For a very ample history and description of all the charitable institutions of London, the reader is referred to a volume published in 1810, entitled, "*Pietas Londinensis; the History, Origin, and present State of the various public Charities in and near London,*" by A. Highmore, 12mo.

Institutions.—For the accommodation and convenience of the immense population of the metropolis, the following institutions have been formed for education, for promoting good morals, for advancing the useful and fine arts, and for charitable and humane purposes. For education (besides the various schools already mentioned) there are 16 inns of court and chancery for students in the law, &c. (see COURT, *Inns of*), and five colleges, *viz.* Sion-college, at London-wall, for the improvement of the clergy; Gresham-college, for divinity, astronomy, and other sciences; the college of physicians, Warwick-lane, for professors in medicine; one for the study of civil law, Doctor's Commons; and the Herald's-college. (See COLLEGE.) The number of private schools, for all the various branches of male and female education, is estimated at 3730; including some for children who are deaf and dumb.

For promoting religion and good morals London contains the following societies: 1. For giving effect to the king's proclamation against vice and immorality, established in the year 1707, and for the suppression of vice in 1803: 2. For promoting Christian knowledge, founded in 1699: 3. For the propagation of the gospel in foreign parts, incorporated in 1701: 4. For promoting religious knowledge, by distributing books to the poor, instituted in 1750: 5. For promoting charity schools in Ireland: 6. For religious instruction to the negroes in the West Indies, incorporated in 1795; and African education society, instituted in 1800: 7. For preventing crimes, by prosecuting swindlers and cheats, 1767: 8. For the encouragement of servants, 1792: 9. For the relief of poor pious clergymen, 1788: 10. For giving bibles to soldiers and sailors, 1780: 11. For giving bibles, and otherwise furthering the purposes of Sunday schools,

1785: British and foreign bible society, 1804. To these may be added, Dr. Bray's charity for providing parochial libraries; and queen Anne's bounty for the augmentation of small livings of clergymen.

For the promotion of learning, and advancement of the useful and fine arts, are the following institutions: 1. The Royal society, incorporated for promoting useful knowledge, was instituted 1663: 2. Antiquarian society, Somerset-place, 1751: 3. Society, or trustees of the British Museum, 1753: 4. Royal Academy of Arts, Somerset-place, 1768: 5. Society for encouragement of learning, Crane-court, Fleet-street: 6. Society for encouragement of arts, manufactures, and commerce, in the Adelphi-buildings: 7. Medical society of London, Bolt-court, Fleet-street, 1773: 8. Society for the improvement of naval architecture: 9. Veterinary college, St. Pancras: 10. Royal institution for applying the arts to the common purposes of life, 1799: 11. The London institution, in the city, 1805: 12. The Surrey institution near Blackfriars-bridge, 1808: 13. The Ruffel institution, Cornhill-street, Ruffel-square, 1808: 14. The Literary fund, established in 1707, &c.

Among the institutions for charitable and humane purposes, the following may be enumerated: 1. The humane society for the recovery of drowned and suffocated persons: 2. Society for the relief of merchants' seamen: 3. Several societies for support of widows in general: and others respectively for the widows and orphans of clergymen, medical men, officers, artists, and musicians; and for decayed musicians, artists, authors, actors, and schoolmasters: 4. Society for relief of persons confined for small debts: 5. Society for ameliorating the condition of the poor. With these benevolent establishments may be classed the friendly or benefit societies, of which there are in the metropolis and its vicinity about 1600, consisting, in general, of from fifty to one hundred members each. The members consist of mechanic and labouring people, who, by small monthly contributions, raise a fund for their support in sickness, and for their funerals, &c. An act of parliament was passed 33 Geo. III. for the special "*Encouragement and Relief*" of these societies.

Places of Public Amusement.—Considering the vast extent, population, and wealth of London, it certainly contains fewer places of public amusement than any metropolis in Europe. Whether this be the result of accidental causes, or is to be referred to the genius and habits of the people, may, perhaps, be a matter of some doubt. But whatever deficiency exists with respect to number, it yields to no city in the world in the splendour and excellence of those it possesses. Our dramatic authors are not less conspicuous for the brilliancy of their compositions, than our actors are for the judgment and effect which they display in their representation. Mrs. Siddons is, perhaps, the most effective and powerful actresses of the present, or of any former age; while her brother, Mr. John Kemble, must be allowed to possess talents of the first-rate description. In the walk of tragedy many other players have evinced very considerable abilities: among the deceased may be named Garrick, Barry, Betterton, Henderson, Booth, Quin, Ryan, and J. Palmer: and those of the present age, most entitled to historic record, are Cooke, Young, and C. Kemble. It may be safely asserted that the comedians of the London theatres have advanced the mimetic art nearly to the height of perfection. The names of the late Messrs. Lewis, King, Parsons, Woodward, Shuter, and Edwin are justly honoured in the annals of the drama; and those of the following actors are entitled to the unqualified commendation of the theatrical critic: Dowton, Munden, Bannister, Fawcett, Emery, Knight, Matthews, Johnson, Lovegrove, Linton, Simmons, and Blanchard. Many

actresses of the present age possess very considerable dramatic powers; particularly mesdames Jordan, Edwin, Duncan, C. Kemble, Gibbs, S. Booth, Davenport, Liston, and Storace. The English stage has many other performers of merit; but their talents are of a more limited nature than the preceding. In the operatic department, or singing, it has long been the fashion to introduce Italian, or foreign singers to the London boards; although many of our native performers unite to fine and powerful voices much science. Mrs. Billington, Mr. Braham, Madame Storace, Mrs. Mount, Miss Bolton, Mrs. Martyr, Mrs. Bland, Mrs. Dickons, Miss Kelly, Mr. Ingleton, Mr. Phillips, and Mr. Bellamy, are justly admired, and have acquired much professional fame. In action or pantomimic representations, many eminent performers are to be found on the London boards. Besides these there are many others very little inferior. Indeed it may be justly observed, that the companies at the principal theatres consist in general of highly respectable performers. The musical votary never had the means of gratifying his taste with a higher relish than at the present period. New compositions of considerable merit daily issue from the press. The list of our vocal performers comprises the names of some of the first singers in Europe. Our instrumental performers are no less celebrated; and our bands in general exhibit specimens of the highest taste and manual skill.

Appropriated chiefly to dramatic performances are the theatres of Drury-lane, Covent-garden, the Lyceum, and the Haymarket. Of these, the two first are upon a style of magnificence and grandeur, scarcely to be surpassed by any theatre in Europe. The last is on a small scale, and opens in summer, when the others close. The King's theatre, or Opera-house, situated in the Haymarket, was originally intended solely for the representation of Italian operas. Of late years, however, dancing has constituted a prominent part of its amusements, to the great injury of the operas, which are generally curtailed of an act to allow time for the ballets. The decorations of this theatre are splendid, and its band is considered as inferior only to that of the Opera-house at Paris. The concert of ancient music, generally called the King's concert, is held in the great room Hanover-square, every week from the beginning of February to the end of May. It owes its origin to a freedom from the Academy of Music, another celebrated musical institution. The following is a list of the theatres, and other places of public amusement, now occupied in London, and open to the public: a more particular description of some of these will be given in subsequent parts of this work. *See the heads THEATRE and WESTMINSTER.*

Covent-garden Theatre is the most eminent for size and dramatic exhibitions. The present building was erected in the year 1809, from designs by Mr. Smirke, jun. architect. It occupies the site of a former theatre, with connecting houses, which were consumed by fire in September 1808; and it is worthy of remark, that the whole of the present edifice was raised and finished within one year. It is on a large scale, and the whole stage management is vested in Mr. John Kemble, who has certainly made many improvements, and interesting reformations in the internal economy, science, and scenic representation of dramas.

Drury-lane Theatre is now in the progress of building from designs by Mr. B. Wyatt, architect; whose model evinces much skill and judgment. Though not on so large a scale as the theatre of Covent-garden, it combines many conveniences and advantages not to be found in that building; and for seeing and hearing it promises to be very satisfactory to the audience. Mr. Whitbread has taken a very active part in causing this theatre to be rebuilt. A former theatre, built by Mr. Holland, was burnt in 1809.

Theatre Royal Haymarket is a small, inconvenient house, and is allowed to be opened to the public from the 15th of May to the 15th of September.

The Lyceum Theatre, called the *English Opera house*, is at present occupied by the Drury-lane company of performers, under the management of Mr. Arnold and Mr. Raymond. Operas and comedies are chiefly represented here; and some of these are acted in the best style. Many new dramas have been produced at this house.

The Opera-house, in the Haymarket, is appropriated to Italian operas, spectacles, and dances. The management of this house has occasioned several legal litigations, and is still involved in dispute. Its principle is uncongenial to the English character, and it would be a memorable and laudable act to abolish it. Another similar establishment, arising out of the cabals of the former, and originating with some speculating adventurers, has lately been opened at

The Pantheon in Oxford-road; but after a few nights representation, and after debts of some thousands of pounds had been contracted in fitting up, and adapting the house to the purpose, the theatre is again closed.

Sadler's Wells is a theatre appropriated to pantomimes, burlettas, spectacles, dancing, &c. and commences its season on Easter Monday. The stage performances are invented and written by Mr. C. Dibdin, jun., who has displayed a peculiar and original talent in this species of composition. The musical department is conducted by Mr. Reeve, and the scenery painted by Mr. Andrews. A novelty has been introduced at this theatre, *i. e.* of filling the whole space beneath the stage with water, by which means some splendid and curious aquatic exhibitions have been displayed. It partly resembles the naumachia of the Romans.

Astley's Amphitheatre, near Westminster-bridge, is also a summer theatre, where pantomimes, burlettas, and various fetes of horsemanship are displayed. This house also commences its season on Easter Monday, and generally closes in October, when the company remove to another theatre, called

Astley's Olympic Pavilion, in Newcastle-street, where the same species of entertainments are exhibited.

The Surrey Theatre, in St. George's-fields, is devoted to a similar class of dramatic representations; but since Mr. Elliston has been proprietor and manager of this house, he has adopted a novelty, in abridging and versifying many celebrated dramas, and playing the same with the accompaniment of music.

Another theatre in Wells-street, called the *Royal Theatre*, is occasionally opened; and others are situated in Tottenham-street, in the Strand, and in Bridges-street, Covent-garden.

Flower-hill Gardens are opened twice a week in the summer months, when they are ornamented with an immense number of lamps, and a large concourse of visitors are entertained by vocal and instrumental music. Besides the foregoing, London abounds with many other places of amusement; such as tea-gardens, exhibitions for ingenious inventions, and display of works of fancy, &c.

Among the places of public amusement or exhibitions, may be specified—

The London Museum, in Piccadilly, the property of Mr. W. Bullock, who has devoted many years, much exertion, and a great expence, in collecting and arranging the most comprehensive and interesting assemblage of natural and artificial curiosities that was ever before amassed in England, or perhaps in Europe. His museum was originally commenced at Liverpool; but it has been progressively enlarged and improved. Its preserved specimens in natural history are select, in the highest preservation, and arranged according

ing

ing to the Linnæan system. They consist of about 15,000 quadrupeds, birds, reptiles, fishes, insects, corals, &c. One department of the museum is peculiarly curious and interesting. It is called the Pantheon, in which most of the known animals, in a preserved state, and in natural attitudes, are exhibited as ranging in their native, or appropriate haunts; and at intervals of exotic plants, rocks, and trees, are distributed over the apartment: the whole interior of the same is painted in a picturesque manner, representing the oriental forests. For a particular account of the truly interesting collection, the reader is referred to a printed "Compendium to the Museum and Pantheon," 12mo. 2s. 6d. or a similar work, with etchings, by Howitt, price 1s. A new building, in the Egyptian style, has been erected for this museum from designs by Mr. Robinson, architect.

Public Museum, at Exeter Change in the Strand, contains a collection of living birds and beasts; and to the students and lovers of natural history is very interesting. Here are Lions, Leopards, tigers, ottriches, baboons, and monkeys of different kind, Kangaroos, beavers, and various other foreign animals and birds. Other museums and exhibitions of natural and artificial curiosities are—

Doll's shop, in Grosvenor-street, for cork models of several temples, and ancient buildings in Rome:—*Mallard's* automatical exhibitions in Spring-gardens, for fine singular works of mechanism:—*Black's Museum*, Haymarket, is also for mechanical works. At *Barber's Panorama*, in Leicester-square, are exhibited circular views, on a large scale, of several foreign and English cities, towns, and other particular scenes. Mr. Barber has evinced very considerable taste and talents in this branch of art, and to him the public are indebted for the first invention of panoramic views. Since he commenced, several other artists have exhibited similar pictures: Mr. Giren, a view of London; Mr. Pirie, several paintings of battles; and a *New Panorama* is now opened by Reinagle and Barber, in the Strand. See PANORAMA.

The Fine Arts, and Exhibitions of Works of Art, in London, are entitled to distinct and particular notice; for their present state is calculated to shew the extraordinary progress they have made during the last century, and to display the highly cultivated cultivation of the present age. London is the focus of the fine arts of England, and fountain-head of excellence. Here all the eminent spirits of the country either originate, are developed, or terminate their career; because all the great masters collect here; the best instruction is to be obtained; the most celebrated productions to be seen and studied; and annual exhibitions displayed to the public. In the rooms of the Royal Academy at Somerset-house, in those of the British Institution, Pall-Mall, at Spring-gardens, and in Bond-street, are exhibited all sorts of paintings, drawings, sculptural and architectural designs; and a careful examination of the works here exhibited will furnish a foreigner with an opportunity to appreciate the individual and aggregate merits of English artists. Besides these public exhibitions, it will be expedient to visit the galleries of Mr. West, Mr. Turner, Mr. Wilkie, Mr. Lawrence, and some other painters; for in these will be seen some of the most meritorious works of the age. The best collections of our modern sculptors will be found in the church of St. Paul's and in Westminster Abbey; whilst the true talents of the architects can only be appreciated by a personal examination of the buildings they have erected. The public institutions devoted to the fine arts are the following:

At the *Royal Academy*, in Somerset-house, is the annual exhibition for the period of about six weeks, of paintings, drawings, sketches, and proofs-prints. The society was established by charter in the year 1768, and Sir Joshua

Reynolds appointed its first president. To this great artist, as a painter, collection of a man, and lover of art, the Royal Academy is indebted for its present prosperity and reputation. His fascinating productions, combining manner and luminous colouring, attracted the attention and patronage of the most distinguished, and at the same time, raised the public mind to a noble and judicious estimate. Since the death of Sir Joshua, the academy has opened its doors, with its usual splendour, to the public exhibition of new pictures in the fine arts of painting. A series of lectures has been annually given at the academy by different professors; all calculated to advance art, and to elucidate proper principles of taste and criticism. Some of the present lecturers are deservedly famed for professional science, as well as for general knowledge. In the years 1811 and 1812, the following professors delivered lectures on their respective provinces of art: Henry Fuseli, on painting; John Soane, on architecture; Anthony Carlisle, on anatomy (it is necessary to state that this gentleman is not a member of the academy); J. M. W. Turner, on perspective; and John Flaxman, on sculpture. The Royal Academy consists of forty members, called royal academicians, twenty associates, and six associate engravers. Further particulars of this institution will be given under ROYAL ACADEMY.

The British Institution, in Pall-Mall, was established by the liberal contributions of several noblemen and gentlemen in the year 1805, for the express encouragement of British artists: and it must afford much gratification to the founders to contemplate its great utility and successful effects. This institution is devoted to the exhibition and sale of pictures; and to the use of young students for copying from and studying old paintings. Another plan has been recently adopted, which is calculated to enhance its utility and reputation. This is the purchase of possession pictures, which are to be preserved as the property of the institution, and from which engravings are to be made on a large scale. The first of this series is a large painting by Mr. West, of "Christ healing the Sick in the Temple;" and Charles Heath is engraving a plate from it.

The Society of Painters in Water Colours was established in November 1804, since which time they have annually exhibited a large and interesting collection of drawings. This branch of art may be said to have attained to a high degree of excellence; and many of its protectors have manifested distinguished talents. In colouring, effect, and appropriate character, several young artists of the present age have surpassed any of the old masters in this branch of art. Another society of artists have made an annual exhibition of drawings in Bond-street. The collections of pictures in private houses in London are numerous, and many of them very valuable. The most celebrated of these are the marquis of Stafford's at Cleveland House; (for an account of these pictures, see Britton's "Cavalry of Rivers;" and Tresham's "Gallery of Pictures;") the collection at Buckingham-house; the earl of Grosvenor's, in Grosvenor-street; Mr. Thomas Hope's, in Duchels-street; Mr. H. W. Hope's, in Grosvenor-square; Mr. Anderdon's, Spring Garden; Mr. West's, in Newman-street; earl of Suffolk's, in Harley-street; the duke of Devonshire's, in Devonshire-house; Mr. Angerstein's, Pall-Mall; Sir Abraham Hume's, Sir George Yonge's, in Stratford-place; Lord North's, in Grosvenor-square; Mr. Weddell's, in Upper Brook-street; Lord Athburham's, in Devonshire-street; Lord's Lucas's, in St. James's-square; Sir George Beaumont's, in Grosvenor-square; Mr. William Sturt's, in Park-street; Mr. Knigh's, of Portland-place; Mr. Jeremiah Harman, of Finsbury-square; Mr. R. P. Knigh's,

Knight, of Soho-square; lord Radstock, in Portland-place. Besides these, there are many other collections of fine pictures in various parts of the metropolis. For much useful information respecting the fine arts in London, &c. see Hoare's "Inquiry into the present State of the Arts of Design in England," 8vo. 1806; also two other volumes in 4to. edited by the same intelligent and liberal writer, entitled "The Artist in a Series of Essays;" also, "The fine Arts of the English School," 4to. 1812; Britton's Preface to an Account of the Corham-House Collection; and Edwards's Anecdotes of Painters in England, 4to. 1808.

Courts.—For an account of the various courts of London, the reader is referred to a former volume, under the head *COURT of Common Pleas, of Chancery, of Exchequer, of Hustings, of King's Bench, of Marshfield, Mayor's, of Parliament,* (see PARLIAMENT,) *of the House of Peers, of Star Chamber;* also, *1808 of Court.*

Literature and literary Publications.—To give a view of the literature of this metropolis, and to point out its present state, compared with that of any former period, would be to develop one of the most interesting traits, not only of London, but of the present age. The number and variety of works which annually issue from the metropolitan press are truly astonishing; while in point of ability and usefulness they were probably never exceeded. There is not indeed a department, either in science or general literature, which has not made considerable progress within these few years. The publishing and book-selling businesses are at present conducted upon very large scales; and, in spite of a long and devastating war, a succession of new and interesting volumes is continually issuing from the press. It is conjectured that nearly 800 new books and pamphlets have been annually published in London, during the last ten years: the gross annual returns arising from the printing and selling of which cannot be much short of one million sterling. It is also estimated that 2000 persons at least are directly and collaterally employed in the various branches of the book business. The character and extent of periodical literature form a prominent feature of the present age: for the number of reviews, magazines, newspapers, and other periodical journals, far exceed those of any former period. Hence much political and general knowledge has been disseminated through the country: a spirit of inquiry and investigation has been excited; and a literary turn has been given to the higher and middle classes of society. Even the lower classes of mechanics and servants are now much accustomed to reading: one of the consequences arising from which is that we frequently hear of men of genius and talents starting up from humble stations, and displaying to the astonished world much originality of thinking. Many instances of this might be adduced; but it will be sufficient to name two or three, to prove the assertion: Burns, Dermoddy, and Bloomfield, the poets; and Drewe, the metaphysician of Cornwall. Nothing can more plainly shew the reading character of the present times, than a knowledge of the number of newspapers printed and circulated; and which number is thus stated in "The Picture of London for 1812:" "Of the morning papers, there are sold about 17,000 of these publications; of the daily evening papers, about 12,000; and of those published every other day, about 10,000. There are also about 26,000 fold of the various Sunday papers; and about 20,000 of the other weekly papers; in all, the enormous number of 232,000 copies *per week*; yielding to their proprietors from the sale 5800*l.*, and from advertisements 2000*l.* more; of which the revenue to government is full 4000*l.* and the net proceeds to the proprietors about 1000*l.*: the remaining 2800*l.* affords employment and sub-

sistence to about 50 writers and reporters, 300 printers, 100 vendors, and 100 clerks and assistants; besides paper-makers, stationers, type-founders, &c. full 200 more. If to these be added the weekly calculation of 250,000 copies of provincial papers, yielding 10,000*l.* *per week*, and supporting the industry of 1500 persons;—what a wonderful idea is afforded of the agency and influence of the press in this empire; and how easily is it accounted for, that we are the most free and most intelligent people on the face of the earth." Under the words MAGAZINE, NEWSPAPER, and REVIEW, we shall have opportunities of detailing many facts and peculiarities respecting these different publications. See also JOURNAL, *Literary.* London abounds with book-sellers' shops and circulating libraries. It is asserted that the first circulating library established in this town was by a Mr. Batts, about the year 1740; but Alan Ramsay had founded one at Edinburgh as early as the year 1725. In London there are published fifteen newspapers daily, and eighteen or nineteen every Sunday, besides eighteen once or twice a week. The number of monthly magazines and reviews amounts to fifty; in addition to which, there are several works published quarterly, or at irregular periods.

Societies for the Encouragement of the Arts, &c.—London possesses a variety of institutions formed with a view to the advancement of the different branches of art and science; among these the Royal Society undoubtedly takes the lead, being composed of the most distinguished literary and scientific characters of the present age. It was first instituted at the close of Cromwell's rebellion, at which time its meetings were held at Oxford. In 1659 they were adjourned to Gresham college, London; but of late years have been held at an apartment in Somerset house. This society was incorporated in 1663, when the celebrated sir Isaac Newton was president, and has, through the medium of its Transactions, and by its patronage, probably contributed, more than any similar body in the world, to promote useful and practical knowledge. (See ROYAL SOCIETY.) The society of Antiquaries, which holds its meetings in the same place with the Royal Society, was incorporated by Geo. II. in the year 1751. The object of this society is to encourage research in the elucidation, not only of our national antiquities, but of the antiquities of other countries. It has published sixteen volumes, called the Archaeologia, containing many curious and interesting essays and prints, also a large work illustrative of our ecclesiastical architecture. (See SOCIETY of Antiquaries, and ANTIQUARY.) The society for the encouragement of arts, manufactures, and commerce, instituted in 1753, and holding its meetings in the Adelphi, proposes the attainment of its object by giving premiums for all inventions and discoveries which may prove, and are calculated to be, beneficial to the arts, commerce, or manufactures of the kingdom, the British colonies, or the East India settlements. A volume of the Society's transactions is published occasionally. The walls of the great room, in which its meetings take place, are adorned with a variety of paintings from the pencil of Mr. Barry, the style and execution of which have indeed him deserved immortality, and are really an honour to the country. The Linnean society was founded in 1788, and incorporated in 1802. (See LINNEAN SOCIETY.) The Royal Institution, situated in Albemarle street, owes its foundation chiefly to the schemes and exertions of count Rumford. Its charter of incorporation is dated in 1800. The original object of this institution was to facilitate the introduction of useful discoveries and improvements in practical mechanics, and to point out, by philosophical lectures and experiments, the application of science to the common purposes of life. The investigations and important discoveries of Dr. Davy, the lecturer

lecturer on chemistry, have conferred no small degree of celebrity on this establishment, while they will not improbably be the means of effecting a complete change in our views of chemical analysis. (See *ROYAL INSTITUTION*.) The London Institution, as well as the Surrey Institution, embrace similar objects to the one preceding. The former was founded in 1805, and the latter in 1808. Both have extensive libraries and reading rooms, furnished with many of the foreign and domestic journals and other periodical works, together with the best pamphlets and new publications. The views of the Russell Institution are the formation of an extensive library, consisting of the most valuable books in ancient and modern literature, to be circulated among the proprietors, the delivery of lectures on literary and scientific subjects, and the establishment of a reading room. In Gresham college, founded by sir Thomas Gresham, lectures are delivered gratis twice a day during the terms, on divinity, law, physics, astronomy, geometry, music, and rhetoric. As it happens in all institutions on a similar plan, the lecturers, having no stimulus to exertion, consider their duty as a mere matter of routine, and are consequently ill attended. Some idea is entertained of transferring them and the funds to the London Institution, where it is hoped they may be more efficient, and answer better the design of the benevolent founder. The British Mineralogical Society was established in 1799, for the express purpose of examining gratuitously the composition of all specimens of minerals and soils, sent for that purpose by the owners of mines, agriculturalists, or others interested in the enquiry. The science of entomology will probably be much forwarded by the institution of the Entomological Society, which took place in 1806, and which chiefly directs its attention to the investigation of the properties of such insects as are natives of the united kingdoms. The London Architectural Society has published a volume of Essays, 8vo. 1808: also an Essay on the Doric order. The Horticultural society was founded in 1804. A Geological Society is established by some scientific gentlemen in Lincoln's-inn-Fields; they have recently published an interesting volume of their transactions. Before we quit these institutions it may be proper to remark, that the number and variety of lectures that have been read in them must have proved beneficial to science; by exciting inquiry, and investigating facts by experiment. Till these institutions were established, there were but few public lectures given in London; such, however, have been the influence and effect of them, that during the winter of 1811-12, it may be asserted that no less than fourteen courses have been given at the Royal, Russell, and Surrey Institutions. We subjoin the names of the principal professors: Dr. Davy, Dr. Roget, Dr. Crotch, J. M. Good, esq., Geo. John Singer, esq., Dr. Shaw, F. Accum, esq., Sam. Wesley, esq., Mr. Hardie, Robert Bakewell, esq., Dr. Brande, James Qum, esq., John Pond, esq., and Wm. H. W. esq.

The British Museum, situated in Great Russell-street, is a grand national depository of antiquities, MSS. and books, with various natural and artificial curiosities. It was established by act of parliament in 1753, in consequence of sir Hans Sloane having left, by will, his museum to the nation, on condition that parliament paid 20,000 *l.* to his executors, and purchased a house sufficiently commodious for its reception. Since that period many valuable collections of manuscripts, books, &c. have, at different times, been added to the Sloanean, besides innumerable presents from our own monarchs, foreign princes, the boards of Admiralty and Longitude, the East India Company, the various literary societies of London, Edinburgh, Oxford, Cambridge, and Leyden, the Royal

and Imperial academies of Brussels, Lisbon, &c. and a long list of private individuals, too numerous to be particularized. The vast variety of articles which this museum contains, its extent and value, entitle it to be considered equal to any in the world. Under the word *MUSEUM* will be given further particulars of this national repository; in the mean time the reader is referred to a "Synopsis of the Contents of the British Museum," 8vo. 1808; and to a quarto work of "Engravings from the Gallery of Antiquities in the British Museum," by Mr. Taylor, Combe, and Mr. Alexander. This very handsome and interesting work is now in the progress of publication, and is very creditable to the trustees who have commenced it, and to the draftsman and author by whom it is chiefly executed.

Public Vices and Prisons.—The general tendency of the preceding statements only shew the best and most interesting features of the metropolis. It is our duty also to depict its vices; and to shew the numerous places that are set apart for the punishment of crimes. In Colquhoun's work on "the police of the metropolis," is such a deplorable display of profligacy and criminality, that an inexperienced reader, who knew London only through the medium of this publication, would conclude that its inhabitants were mostly composed of vagabonds, sharpers, pickpockets, and prostitutes. It should be remembered, however, that the work is chiefly devoted to this subject: and that, amidst so vast a population, and where there are so many opportunities for rogues to practise their depredations, and screen themselves from detection, it is not surprising that so many are collected together, and that out of a great number so few are brought to condign punishment. To this great hive of human society, the most vicious, and also the most learned resort, as the best place for action and exertion. The worthy magistrate already named, has enumerated and described eighteen different classes of cheats and swindlers who infest the metropolis, and prey upon the honest and unwary: besides persons who live by gambling, coining, housebreaking, robbery, and those who plunder on the river. He deduces the origin of most of the crimes from alehouses, bad education of apprentices, servants out of place, Jews, receivers of stolen goods, pawnbrokers, low gaming-houses, smuggling, associations in prisons, and prevalence of prostitution. No less than 50,000 prostitutes are supposed to live in the metropolis. An amazing number, and a distressing circumstance to contemplate: for it is presumed that eight-tenths of these die prematurely of disease and in wretchedness, having previously corrupted and contaminated twice their own number of young girls and young men. The following is a list of the public prisons.

1. Newgate, being the city and county goal for debtors, felons, libellers, and other offenders against government. See *NEWGATE*

2. Giltspur-street Compter was erected in 1791, for debtors, felons, and persons committed for misdemeanors. It is situated near Newgate, and is a large, commodious building.

3. Ludgate, adjoining to the last mentioned, is appropriated only to debtors who are freemen of the city of London, clergymen, preceptors, or attorneys.

4. The Poultry Compter is chiefly for debtors. It is situated near the Mansion-house, and has one ward set apart for Jews: the only prison in England that has such a provision.

5. The Fleet Prison is for debtors, and for such persons as are committed for contempt of the courts of chancery.

6. The Savoy Prison, in the Strand, is exclusively devoted to deserters and military delinquents.

7. The New Prison, Clerkenwell, is the goal for the county of Middlesex, for felons, and for persons committed.

8. The Prison for the 'Liberty of the Tower of London,' is at Bethnal-green, and is used only for soldiers belonging to the Tower.

9. Whitechapel Prison, for debtors in the 5th court.

The houses of correction are

10. The City Bridewell, Bridge-street, Blackfriars.

11. Tothill-fields, Clerkenwell.

12. Cold Bath Fields, Penitentiary House.

13. New Bridewell, in the borough of Southwark.

14. County gaol, Surrey, in the borough of Southwark, for felons and debtors.

15. New goal, Southwark, or Borough Compter, for felons and debtors.

16. Clink goal, for the district of that name, in Southwark.

17. The Marshalsea goal, Southwark, for pirates, and for persons arrested for small debts in the Marshalsea court.

18. King's Bench prison, St. George's Fields, for debtors, and for persons committed for contempt of the court of King's Bench, of which this is the peculiar prison.

Public Buildings.—It will surprise a foreign architect to look through the wealthy city of London, and perceive so few public edifices that display architectural beauty, or grandeur. Various circumstances have conspired to occasion this; and not want of abilities in our artists: for many names can be mentioned, both of deceased and living architects, whose designs would honour and ornament any city. Those whose works are most conspicuous in London, are Inigo Jones, Sir Christopher Wren, Gibbs, Hawksmoor, Dance, Soane, Samuel Wyatt, Jupp, Sir Robert Taylor, Smirke, Milne, Holland, and Adams. The public edifices of London, are bridges, (for an account of which see BRIDGES,) churches, public offices, hospitals, and private mansions. Squares and regular streets constitute a distinguishing feature of town architecture. Some of the public buildings are spacious, commodious, judiciously adapted to their respective purposes, and display beautiful, fine, and even grand parts. The English architect is justly noted for the skill and judgment he often evinces in designing and adapting the interior of his buildings; and this is certainly the most essential part of the profession. The principal public edifices within the precincts of the city, and in the eastern part of the town, are the Tower; the New Mint; the Trinity House; the Bank; the Mansion House; the Royal Exchange; the East India House; the Auction Mart; the Common Law Court; the Custom House; the Excise Office; Guildhall; the bridges of London and Blackfriars; the Post-office; Newgate; Giltspur-street Compter; St. Luke's Hospital; the churches of St. Paul, Bow, St. Stephen's Walbrook, St. Bride's Fleet-street.

Tower of London.—This celebrated building stands on the north bank of the river Thames, at the eastern extremity, and just without the limits of the city. If credit is to be given to the statement of Fitz-Stephen, it owes its original foundation to Julius Cæsar, but this assertion is supported by no evidence. The first authentic notice of it is, that William the Conqueror erected a fortress here immediately upon his obtaining possession of London in the year 1066, with the view of intimidating the citizens from any opposition to his usurpation. This monarch seems, about twelve years afterwards, either to have much enlarged the previous edifice, or to have built another on its site or near it. This building forms, what is now called, the White Tower, from its having been repaired and white-washed by Henry III. in the

year 1240. It is a large square structure, situated near the centre of the present fortress, and surmounted by four watch towers, one of which is used as an observatory. It consists of three lofty stories, in the first of which are two grand rooms, one of which is a small armory for the naval service. The other buildings and fortifications have been erected at different periods. The principal of the former are, the church dedicated to St. Peter *ad vincula*; the ordnance office; the mint; the record office; the jewel office; the horse armory; the grand store-house; the new or small armory house belonging to the officers of the Tower, and barracks for the garrison. The whole comprises, within the walls, an extent of twelve acres and five roods. The exterior circumference of the ditch, which entirely furrounds it, measures 3176 feet. This ditch, on the side of Tower-hill, is broad and deep, but becomes much narrower on that nearest the river, from which it is divided by a handsome wharf, having a platform upon it, mounted with sixty-one pieces of cannon. Besides these, there are a number of great guns, arranged as small batteries, on different parts of the walls. The chief entrance is by a stone bridge thrown over the ditch on the west-side of the Tower. At the outer extremity of this bridge are two gates, and within the ditch another, all which are shut every night, and opened in the morning with particular formality. The wharf is connected with the Tower by a drawbridge, near which is a cut leading from the ditch to the river, secured by a gate called Traitor's Gate, from the circumstance of state prisoners having been formerly conveyed by this passage to Westminster for trial.

This fortress was a palace, inhabited by various sovereigns of England till the reign of queen Elizabeth. Since that period it has been chiefly used as a state prison, and as a place of security for arms and property belonging to the crown. In one of the rooms of the White tower, called Cæsar's chapel, a variety of ancient records of the court of chancery are deposited. All the models of new invented engines of destruction, which have been presented to government, are preserved in another room adjoining. The old mint, and the houses belonging to the officers employed in the coinage, occupied nearly a third of the whole fortress. A yard, to the right of the western entrance, contains the royal menagerie. In the Spanish Armory are kept the trophies of the celebrated victory over the Spanish armada; the axe with which the unfortunate Anne Bullen was beheaded; and a representation of queen Elizabeth, dressed in the armour she wore when she addressed her army at Tilbury, in the year 1588. The Small Armory, one of the finest rooms of its kind in Europe, contains complete stands of arms for upwards of 100,000 men, arranged in a most elegant manner, besides other curiosities. Under this armory is another very noble room belonging to the royal train of artillery, where many beautiful and uncommon pieces of cannon may be seen. The Horse Armory is filled with curiosities of different kinds. Among these are the figures of the kings of England on horseback, chiefly dressed in the ancient armour. In the Jewel Office are preserved the imperial regalia, and all the crown jewels worn by princes and princesses at coronations. Independently of several, which are inestimable, the value of the precious stones and plate in this office considerably exceeds two millions sterling. These, as well as the government of the whole Tower, are entrusted to the care of an officer, called the constable of the Tower, who has under him a lieutenant, deputy-lieutenant, tower-major, gentleman porter, and a number of inferior officers. The garrison is composed of a detachment from the guards. The rising ground adjacent to the Tower

Tower is called Tower-hill. The right of the city to this spot was long disputed by the crown, but in the reign of Edward III., some of the king's officers having erected a gallows here, the citizens remonstrated, whereupon that monarch issued a proclamation, which he disavowed in the act, and virtually acknowledged the city's jurisdiction, by delivering over the persons about to be executed to the sheriffs; and desiring that they should preside at their execution. On the site of the old victualling office, to the east of the Tower, an extensive building has been lately erected from designs by Mr. Smirke, jun. for the Mint. It is composed of a long front of stone, consisting of a ground-floor, with two stories above; the whole surmounted by a handsome balustrade. The wings are ornamented with pilasters, and in the centre are several demi-columns, over which is a pediment, decorated with the arms of England. The porch is covered with a gallery, balustrades, &c. all of the Doric order. Adjoining are houses for the principal officers.

Mansion-house.—This building, the residence of the lord mayor of London, is situated to the west of Lombard-street and Cornhill. It is of an oblong form, and constructed of Portland stone. From its massive style and vast extent, it is calculated to make a magnificent appearance, but the effect is destroyed by its confined situation. A wide and lofty portico, composed of six fluted pillars of the Corinthian order, with two pilasters at each side of their pediment, of the same order, form the chief ornament of the front. Under this portico is a low basement story, in the centre of which is the gate-way leading to the kitchen and offices. A flight of steps ascends to the principal entrance door-way beneath the portico. These stairs are inclosed by a stone balustrade, continued along the whole length of the front. The pediment of the portico is adorned with a piece of sculpture emblematical of the wealth and grandeur of the city. In the centre is a female figure representing the city, having a wand in her right hand, and her left resting on the city arms. On her head is a mural crown, and under her left foot a figure of Envy. Near her on the right is a cupid, with the cap of liberty affixed to a short staff, leaning on his shoulder, and beyond him reclines a sea god, to represent the Thames, having at his side an anchor fastened to a cable. To the left of London is Plenty, with a cornucopia, and behind her two naked boys, with bales of goods to denote Commerce. The west side of this edifice presents a range of very noble windows, placed between coupled Corinthian pilasters. Its interior exhibits a sufficient degree of splendour, but is far from being comfortable, as many of the rooms are dark. Some of the apartments are very large, and fitted up in a sumptuous style; particularly the Egyptian hall, the ball-room, &c.

Commercial Hall.—It has long been a complaint in the city that some respectable place of general accommodation was wanted for the disposal of imported merchandize, but principally for that of colonial produce. Several attempts have been made to remedy this defect, but without success. About a year ago, Messrs Smith, Marten, and St. Barbe called a meeting of merchants and brokers, in order to establish an institution for this purpose. A large subscription was raised almost instantly, and as soon as a plot of ground, sufficiently large, and in a suitable situation, could be procured, a number of plans were submitted by different architects, from an examination and comparison of which, a new design was formed and carried into execution under the direction of J. Woods, jun. whom the committee chose for their architect. The original intention of the establishment was

principally for the accommodation of public sales, but it has been extended to provide equal conveniences for sale by private contract; and thus to form a complete market for sugar, cotton, coffee, tobacco, indigo, and other imported goods.

The building is composed of two principal parts. The front consists of an entirely new edifice 64 feet long, and 39 feet broad, with a stone front, ornamented with six columns of the Ionic order, adopted, with little variation, from the temple of Minerva Polias, at Priene. These columns are supported on pedestals, which rest on the cornice of an inferior order, composed not of columns but of piers, whose squareness and solidity form a contrast with the lighter and more varied proportions of the columns above. This order of piers forms the ground story of the building. The spaces between the pedestals are filled up with balusters, and above the windows, which are large and suited to the scale of the building, are five bas-reliefs, executed in artificial stone by Bubb: the middle compartment representing the city of London, the four others, Navigation, Commerce, Agriculture, and the Arts. The whole of the ground floor of this edifice is occupied by a magnificent coffee-room, at one end of which, between two columns, appear the stairs leading to two public sale-rooms, one of which is about 35 feet by 30, and again on the upper floor to three more sale-rooms, each about 25 by 20 feet.

The second building formerly consisted of three houses, which are now thrown into one: the lower floors are divided into a number of counting-houses, the upper into five show-rooms, the largest of which, sixty feet long, is appropriated for the exhibition of goods intended for sale.

Particular attention has been paid to the lights in these rooms, and by a succession of sky-lights sloping to the north the perfect light of day is admitted, and the sun effectually excluded. The space between these buildings, and that behind the latter on the ground-floor, is occupied by a number of rooms lighted in the same way, all of which are intended for the sale of sugars.

The object of this building is the attainment of public convenience; by bringing into one point what before had been scattered among several coffee-houses, and the rooms of individuals.

East India House.—This edifice is situated on the south side of Leadenhall-street, and comprises the principal offices of the East India Company. It was originally founded in the year 1726, but has recently been so much altered and enlarged, under the superintendence of Mr. Jupp, architect to the company, as to appear like an entire new building. The front, composed of stone, is very extensive, and displays a general air of grandeur and simplicity. In the centre rises a noble portico, supported by six Ionic fluted columns. The frieze is sculptured with a variety of antique ornaments, and the pediment exhibits several figures emblematical of the commerce of the company, protected by his majesty, who is represented in the act of extending a shield over them. On the apex of the pediment is placed a statue of Britannia, to the east of which is a figure of Asia, and on the west another of Europe. The interior can boast of several very noble apartments, particularly the sale-room, which may be justly reckoned among the curiosities of the metropolis. In this house the courts of the East India Company are held, and all its official and general business transacted. Several large and commodious ware-houses are distributed in different parts of the town, where teas and other imported goods are deposited. See COMPANY, *East India*.

LONDON.

The London Monument.—This noble pillar, perhaps the finest in the world, stands on the east side of Fish-street-hill, about two hundred yards from the north end of London-bridge. It was erected by the celebrated Sir Christopher Wren, to commemorate the dreadful fire of 1666, which destroyed a great part of the city, and commenced near this spot. This monument is a fluted column of the Doric order, with a base and capital, surmounted by a ball. Its diameter at the base is fifteen feet. The mally pedestal measures 40 feet, the column 120, the cone above it, with its urn, 42, so that the entire height of the pillar is 202 feet. The interior contains a flight of 345 steps, ascending to a balcony, from which the visitor has a very extensive prospect of the metropolis and the adjacent country. The obscure situation of this beautiful and majestic pillar is much to be lamented, for were it placed in a conspicuous position, it would form a great and striking ornament to the metropolis.

The Post-Office is situated in an area on the south side of Lombard-street. As a building, it is not only unworthy of notice, but when the importance and magnitude of its concerns are considered, is really a disgrace to the country and the metropolis. Such an important establishment should be well and properly accommodated. As a national institution, however, it deserves particular attention, being perhaps the most perfect system of internal economy, of its kind, in the world: it keeps up a constant communication, directly or indirectly, with every town in the united kingdom, as well as with every foreign port in the most remote degree connected with the British empire. It possesses likewise the double advantage of being incalculably useful to individuals, and affording a large revenue to the government. Indeed, of all the means of finance any minister ever employed, it is beyond comparison the best; while at the same time it may justly be regarded as the soul of commerce. The present post-office was built in 1760, but since that time great additions have been made to the building. At the commencement of the post-office system, the whole was vested in private persons, and was irregular, defective, and insecure. A few years back a very important plan was suggested by Mr. Palmer, of conveying letters to all parts of the kingdom by means of mail coaches; whereby a speedy communication, and security from robbery were effected. See MAIL COACHES, and POST-OFFICE.

The Trinity House—On the north side of Tower-hill is a large, handsome, regular building, which was erected from designs by Samuel Wyatt, architect. The chief business of the Trinity-house corporation, which was founded in 1512, is conducted here, though the old established house is at Deptford. The corporation consists of one master, four wardens, eight assistants, and twenty-eight elder brethren, who are styled "the guild, or fraternity of the most glorious and undivided Trinity, and of St. Clement, in the parish of Deptford-Strond, in the county of Kent." The object of this corporation is to superintend and guard the interests of the British shipping, both military and commercial. Their powers are extensive; and their objects important. They have to examine the children who are instructed in mathematics in Christ's hospital; examine the masters of the King's ships; appoint pilots for the Thames; erect light-houses and sea-marks in the British coast; grant licences to poor fishermen who are not free of the city, to ply for fares on the Thames; superintend the deepening and cleansing of the river, &c. The Trinity-house contains some handsome apartment, particularly the hall, the stair-case, and the court-room; in one of which is a fine model of the ship

called the Royal William; also portraits of twenty-four of the elder brethren, and of other eminent persons.

The Lunatic Hospital, called St. Luke's, in Old-street, a large pile of building, was erected from designs by George Dance, who also built the prisons of Newgate and the city Compter. In all these he manifested much skill and judgment; but there is a great want of both in the new front.

The Guildhall of the city is a piece of architectural absurdity.—It is appropriated to the chief public offices of the corporation of London. the principal of these is the great hall, 153 feet long, by 48 broad and 55 high, in which the large city feasts are held, where public meetings are assembled, and the lord-mayor and members of parliament elected. Here are several portraits of sovereigns, judges, lord-mayors, &c.; also large marble monuments to the justly esteemed lord-mayor, Blackford, the great lord Chatham, &c. Besides the hall, the following offices are included in the present building; chamberlain's-office, the court of king's bench, in which the lord-mayor's court and sessions of the peace for the city are held; a court of common pleas, and court of exchequer; a court, called common council chamber, for the lord-mayor, aldermen, and common council. Attached to the Guildhall is an old chapel, which formerly belonged to a religious establishment, but is now used as a justice-room for the aldermen.

The Bank of England, an immense pile of building, is more extensive in its range of offices, and more eminent for its architectural adornment and interior arrangement, than any single public edifice in the metropolis: for Somerset-house, or place, consists of various offices, dwelling-houses, &c. It presents an irregular and incongruous medley of styles and forms; having been built at various periods by three different architects. The eldest part, i. e. the centre of the principal, or south front, with some apartments on the same side, was designed and erected by George Sampson, in the year 1733: and the lateral wings of this facade, and the returns on the east and west sides, with several offices immediately attached, were built by Sir Robert Taylor, between 1770 and 1786: but the great alterations and additions that have been made since the year 1788 by Mr. Soane, constitute the prominent features of this noble edifice. It would occupy a volume to describe the whole arrangement and extent of the bank: it must suffice on the present occasion to mention a few of its leading characteristics. The whole buildings are included in an area of an irregular form, the exterior wall of which measures 365 feet in front, or on the south side; 440 feet on the west side; 410 feet on the north side, and 245 feet on the east side. This area comprises eight open courts, one rotunda, or circular room, several large public offices, committee rooms, and private apartments for the residence of officers and servants. The principal suite of rooms is on the ground-floor, and there is no floor over the chief offices; but it is necessary to state, that beneath this floor, and even below the surface of the ground, there is more building, and more rooms than above-ground. Part of the edifice is raised on a masonry, soft soil, for the stream called Wallbrooke run here, and it has been necessary to pile the foundation, and construct counter arches beneath the walls. The following is a list of the principal public rooms, with their dimensions; on the southern side, dividend-pay office, 44 by 40 feet; the three per cent. reduced office, 50 by 40 feet; pay-hall, 40 by 70 feet; stock office, 60 by 45 feet: three others of nearly the same dimensions; the rotunda, 55 feet in diameter; the consol office, 80 feet by 48, is a noble room; court-room, 60 by 30 feet, ad-

joining which is the great committee room; office for notes under 5*l*, 6*s* by 4*s* feet; and the chief cashier's office, 45 by 30 feet. Besides these, the Bank contains many other offices and apartments: among which may be named the secretary's office, bullion office, deputy governor's rooms, general cash-book office, out-teller's office, land-tax redemption office, loan, or property office, drawing office, accountant's office for the new specie, cheque office, reduced annuity office, dividend pay-office, armoury, bank-note printing-office, engraver's rooms, the library, &c. Such is the extensive business of the bank, that above 1000 persons are employed in its various offices. Of the architectural characteristics of this edifice, its extent, arrangement, and adaptation to the accumulated and increasing business of the British bank, it will be impossible to convey satisfactory information, in a limited space, and without illustrative prints. We can only briefly describe a few of the principal features. The oldest part by Sampson, combines a degree of simplicity united with grandeur; and was admirably adapted to its original purpose. It bespoke the character of a public edifice, with a rich and appropriate style of design. The whole assumed an air of dignity and importance, with a sufficiency of ornament and dress. On a rusticated basement are two stories with Ionic columns, and a bold entablature. An uniformity of character pervades the whole. With such a model before him, it is astonishing that Sir Robert Taylor did not design his additions in the same style, or in one that harmonized with it: but it seems evident that he did not feel or appreciate the charms of simplicity. He preferred prettiness to propriety, and gaiety to grandeur, and therefore designed the wings, with the offices immediately attached, in the most gorgeous style of Roman architecture. Corinthian fluted columns, arranged in pairs, are placed along the whole front, supporting pediments at both extremities, and a balustraded entablature between.

In this façade, the architect has copied a building of Bramante in the Belvidere gardens at Rome; but this very circumstance impeaches his taste and judgment. For though the style and design might have been appropriate and judicious in a small ornamental building, it is very absurd in a great national structure, where solidity, security, and simple grandeur were required. The four and five *per cent.* stock offices are truly disgusting, as works of art; and also very defective as rooms for business. They are both exact imitations of the interior of the church of St. Martin-in-the-Fields. The forms and proportions of the exterior columns much excite our admiration. In the additions and improvements made to the bank by Mr. Soane, since his appointment in 1788, we find many novelties in design, and skilful appropriations. The rotunda is a spacious circular room, with a lofty dome; where a large and heterogeneous mass of persons of all nations and classes assemble on public days to buy and sell stock. The design and construction of the dome, by the last named architect, are entitled to the particular notice and admiration of strangers. In the three *per cents.* warrant office, the same profound artist has displayed much taste and skill. It is an oblong room, with a vaulted ceiling springing from ornamented piers; and in the centre is a handsome dome, or lantern light, supported by caryatides. The soffits of the arches are decorated with panels, roses, and other objects in strict conformity to the practice of the ancient architects. It is worthy of remark, that the whole is constructed without timber. Branching from this apartment is another, called the interior office, adapted to clerks whose business is to guard against forgery.

It opens to Lothbury court, which is a grand display of architectural design, two sides of it being formed by open screens, with handsome fluted columns of the Corinthian order. These are copied from the little temple at Tivoli. On the southern side of this court is a noble arch of entrance to the bullion court, and to other offices. This arch and façade are designed after the model of the celebrated triumphant arch of Constantine at Rome. On the sides of the great archway, are four handsome fluted columns, supporting an entablature, and four statues emblematic of the four quarters of the globe. In panels are basso-reliefs, executed by that great master of sculpture, Banks, allegorically representing the Thames and Ganges. The chief cashier's office is a noble apartment, in the design of which the architect has again shown his enthusiastic attachment to classical antiquity. It is in imitation of the temple of the sun and moon at Rome, and is spacious, simple in decoration, and cheerfully lighted by large and lofty windows. In the accountant's office, governor's court, vestibule and passage from Prince's-street, and recessed portico at the north-western angle, are some specimens of architectural design, which must excite the admiration of every accomplished connoisseur. In all these parts we recognize the forms, style, and detail of the best antique specimens, carefully adapted to their respective situations, and calculated to gratify the eye and satisfy the judgment. Stability is certainly the most essential object in such a building; but beauty and grandeur are equally deserving of attention; for the British bank is rich, its proprietors are presumed to be men of learning and science, and under their auspices we are entitled to look for such actions and such works as shall be ornamental and honourable to the character and taste of the kingdom. In the great enlargements that have been recently made in the present building, it is evident, that the architect has been particularly attentive to the immediate business of the company, the security of their property from fire and depredation, and a chaste, classical style of embellishment. These remarks and descriptions are the result of a recent examination of the building.

Places of Worship.—London is distinguished by the number and variety of its places of worship. It contains 116 churches of the established religion; above 80 chapels of ease on the establishment, in parishes where the population is too great for their respective churches; 11 Roman Catholic chapels; 17 churches and chapels belonging to foreign Protestants; six synagogues of the Jews; and 132 meeting-houses of the different denominations of English Protestant dissenters.

Of the 116 churches above-mentioned, 74 are within the walls of the city, 10 in London, without the walls, nine in the city and liberties of Westminster, five in the borough of Southwark, and 18 in the suburbs, not included in these classes. Of these we can only particularise a few; for descriptions of the whole would require a large volume. Pre-eminent above all the buildings of the metropolis, is the

Cathedral Church of St. Paul, which holds the most distinguished rank among the modern works of architecture in the British empire. The original cathedral was commenced in the year 610, by Ethelbert, king of Kent, and the building, with its revenues and privileges, were greatly increased by succeeding sovereigns. This structure was destroyed by a conflagration in 1564; after which, Maurice, then bishop, commenced the magnificent edifice which immediately preceded the present cathedral. So great was

the magnitude of the building, that neither Maurice, nor his successor De Belmeis, were able to complete the undertaking, though each of them presided twenty years, and expended great sums in the prosecution of it; the latter prelate appropriated the whole revenue of his bishopric to carrying on the work, and supported himself and family by other means. After his death the building was for some time suspended, and the eastern part, or choir, was burnt in the year 1135. At what period it was restored is uncertain; the grand ceremony of consecration was performed in 1240; large additions were afterwards made to the structure, and it was not till the year 1315 that the church was entirely completed; being 225 years from the time of its foundation by Maurice. This ancient cathedral must always be regarded as one of the great works of architecture of the middle ages; in dimensions it far exceeded every other religious edifice in this country; and it is represented by historians as equally pre-eminent in magnificence and splendour of ornament. (For an account of this edifice, see Dugdale's History of St. Paul's.) In the reign of James I., the cathedral having fallen to decay, a royal commission was issued for its repair; but nothing of consequence was done till the advancement of Laud to the see of London, in the succeeding reign. This prelate exerted himself zealously in favour of the neglected building; a subscription was collected to the amount of 101,330*l.* 4*s.* 8*d.*; and Inigo Jones was appointed to superintend the undertaking. He commenced his operations in 1633; and the work went rapidly on till the breaking out of the civil war threw all things into confusion, and the parliament confiscated the unexpended money and materials. After the restoration, the repairs were again commenced; but after much labour and expence, the great conflagration in 1666, destroyed the chief part of the building, and irreparably damaged the remainder. Still, however, the magnitude of the work, and the contemplation of the vast expence of building a new cathedral, occasioned a lapse of several years before it was finally determined that all attempts at reparation were hopeless. The impracticability of restoring the ancient church being now apparent, Dr. (afterwards Sir) Christopher Wren, was ordered to prepare plans for a new cathedral. The pulling down the remaining walls of the old structure, and the removal of the rubbish to the amount of 47,000 loads, proved excessively laborious as well as dangerous, and several men were killed in the progress of the work. This being completed, the first stone of the new edifice was laid June 21, 1675; and the design was prosecuted with such diligence and success, that within ten years the walls of the choir and side aisles were finished, together with the circular porticoes on the north and south sides. The last or highest stone of the building was laid at the top of the lantern in the year 1711; and shortly afterwards the queen and both houses of parliament attended divine service in the new cathedral. The whole structure was thus completed in thirty-five years, by one architect, Sir Christopher Wren, and one master mason, Mr. Thomas Strong, and while one prelate, Dr. Henry Compton, filled the see of London.

The general form or ground plan of St. Paul's cathedral is that of a Latin cross, with an additional arm or transept at the west end, to give breadth to the principal front, and a semicircular projection at the east end for the altar. At the extremities of the principal transept are also semicircular projections for porticoes; and at the angles of the cross are square projections, which, besides containing staircases, vestries, &c. serve as immense buttresses to the dome, which

rises from the intersection of the nave and transept, and is terminated by a lantern, surmounted by a ball and cross of copper gilt. The west front of this fabric consists of a noble portico of two orders, the Corinthian and the Composite, resting on a basement formed by a double flight of steps, of black marble, and surmounted by a spacious pediment. On each side is a tower, with columns, &c.; one serving as a belfrey, the other as the clock-tower. In the tympanum of the pediment is a very large piece of sculpture, in basso-relievo, of the conversion of St. Paul; and on the apex a gigantic statue of the same apostle; whilst on either hand, along the summit of the front, are other colossal statues of St. Peter, St. James, and the four evangelists. Large statues of the other apostles are placed upon pediments on the side walls of the fabric. The dome is the most remarkable and magnificent feature of the building. It rises from a circular basement, which, at the height of about twenty feet above the roof of the church, gives place to a Corinthian colonnade, formed by a circular range of thirty columns. Above the colonnade, but not resting upon it, rises an attic story with pilasters and windows, from the entablature of which springs the exterior dome, which is covered with lead, and ribbed at regular intervals. Round the aperture, at its summit, is another gallery; and from the centre rises the stone lantern, which is surrounded with Corinthian columns, and crowned by the ball and cross.

In its interior form, this edifice is entirely constructed on the plan of the ancient cathedrals, *viz.* that of a long cross, having a nave, choir, transepts, and side aisles; but, in place of the lofty tower, the dome in this building rises in elevated grandeur from the central intersection. The architectural detail is in the Roman style, simple and regular. The piers and arches, which divide the nave from the side aisles, are ornamented with columns and pilasters of the Corinthian and Composite orders, and are further adorned with shields, festoons, chaplets, cherubim, &c. The vaulting of this part of the church merits great praise for its light and elegant construction: in this, each story forms a low dome, supported by four spandrels; the base of the dome being encircled by a rich wreath of artificial foliage. The central area below the dome deserves particular attention: this is an octagon, formed by eight massive piers, with their correlative apertures, four of which, being those that terminate the middle aisles, are forty feet wide, while the others are only twenty-eight; but this disparity only exists as high as the first order of pilasters, at which level the small openings are expanded in a peculiar manner, so that the main arches are all equal. The spandrels between the arches above form the area into a circle, which is crowned by a large cantilever cornice, partly supporting by its projection the "whispering gallery." At this level commences the interior tambour of the dome, which consists of a high pedestal and cornice, forming the basement to a range of apparently fluted pilasters of the Composite order, the intervals between which are occupied by twenty-four windows and eight niches: all this part is inclined forward, so as to form the frustum of a cone. Above, from a double plinth, or the cornice of the pilasters, springs the internal dome; the contour being composed of two segments of a circle, which, if not interrupted by the opening beneath the lantern, would have intersected at the apex. The dome, the idea of which was confessedly taken from the pantheon at Rome, is of brick, two bricks thick; but, as it rises, at every five feet has a course of brick, of eighteen inches long, bending through the whole thickness: for greater security

curity also, in the girdle of Portland stone which encircles the low part, an enormous double chain of iron, strongly linked together, and weighing nearly 96 *cwt.*, was inserted in a channel, which was afterwards filled up with lead. Over this cupola is a cone of brick, so built as to support a stone lantern of an elegant figure. The choir is of the same form and architectural style as the body of the church.

The dimensions of this vast fabric are, height from the ground without to the top of the cross 347 feet, extreme length within 500 feet, greatest breadth 223 feet. The entire ascent to the ball includes 616 steps. The weight of the ball, which is capacious enough to contain eight persons, is 5600 lbs.; and that of the cross, 3360 lbs. For a more particular description of this edifice, with plan of the substructure, elevation of the west front, section of the dome, and north-east view of the exterior, see "*Fine Arts of the English School.*" 4to. 1812.

The particular objects of curiosity which are comprised in this church, and generally shewn to strangers, are the whispering gallery, which encircles the interior of the lower part of the dome, and is so constructed, that a low whisper breathed against the wall, in any part of the circle, may be heard on the opposite side: the library, chiefly remarkable for the floor, which is constructed with small pieces of oak, disposed in geometrical figures: the beautiful model, constructed by sir Christopher Wren; the geometrical staircase, the finest specimen of the kind in Great Britain; the clock, and great bell on which it strikes. The clock is of great magnitude: the length of the minute-hand is eight feet, and its weight 75 lbs.; the hour-hand five feet four inches, and its weight 44 lbs.; the diameter of the dial is eighteen feet ten inches: the length of the hour-figures two feet two inches and a half; the bell is about ten feet in diameter, and its weight nearly four tons and a quarter.

About the year 1790 a scheme was suggested, and has been happily carried into effect, for breaking the monotonous uniformity of the architectural masses in the interior of the cathedral. This was done by admitting large and noble monuments for eminent public persons deceased. These may with strict propriety be termed *national*, as commemorative of British virtues, talents, or heroism. Statues are already erected for Mr. Howard the philanthropist, Dr. Johnson, and sir William Jones. Here are also monuments for generals Abercromby and Dundas, and for captains Mordaunt, Riou, Westcott, Burgess, and Faulkner. Others are now erecting for marquis Cornwallis, lord Howe, and lord Nelson. The latter is interred in the vault under the centre of the building; and near him, his friend lord Collingwood. Among other eminent characters who have been deposited in these vaults, are sir Christopher Wren; Dr. Newton, late bishop of Bristol; Alexander Wedderburn, earl of Rosslyn; sir John Braithwaite; sir Joshua Reynolds, president of the Royal Academy; and two other eminent artists, James Barry and John Opie, *esqrs.*

Although the churches in London are mostly plain, ordinary in architecture, and in obscure situations, yet a few of them are entitled to the notice and admiration of a stranger. That of St. Stephen Walbrooke, built by sir Christopher Wren, is very small, but is justly esteemed for its novelty of design and architectural adornment. "The plan is original, yet simple; the elevation surprising, yet chaste and beautiful; the dome, supported by eight arches, springing from eight single columns, is wonderfully light and scenic in its effect." (*Malton's Picturesque Tour*, p. 76.) Over the altar is a fine picture representing the interment

of St. Stephen, by West. The following churches and towers have claims to architectural beauty, or scientific merit. The tower and spire of Bow-church, in Cheap-side, by sir Christopher Wren; the tower of St. Michael's, in Cornhill; the tower and spire of St. Bride's, in Fleet-street; the church of St. Mary, called the New church, in the Strand, by James Gibbs; the church of St. George, in Bloomsbury, by N. Hawksmoor, built in 1731; the tower and spire of St. Dunstan in the East, by sir Christopher Wren; and the church of St. Paul, Covent Garden, by Inigo Jones.

Members of Parliament.—The city of London has no more weight in the legislative representation of the kingdom, than two small boroughs which are the property of an individual. It sends four representatives to parliament, who are chosen, not by the inhabitant householders at large, but by the livery of the several companies. The right of election was anciently vested in the freemen of the city, which gave rise to many contests between the freemen and livery: till an act of parliament, passed in the eleventh year of George I., settled the question, and gave a peremptory right to the livery only. To be possessed of this elective franchise, a man must have previously obtained his freedom of the city, and also of one of the trading companies, either by patrimony, servitude, or purchase; and must afterwards be admitted to the livery of his company. The present number of electors is about eight thousand, which is not above a third part of the number of inhabitant householders. The elections are held in Guild-hall, and the sheriffs are the returning officers. The city sent two members to parliament as early as 49 Henry III. The number was increased to four, 6 Edward II.: in that and the succeeding reign, four were frequently sent; but since 43 Edward III., this number has been uniformly returned.

Inns of Court and Chancery.—The design of these establishments having been curiously noticed under INNS, it may be proper here to set forth some further particulars relative to each. The inns of court in London are the Inner Temple, the Middle Temple, Lincoln's Inn, and Gray's Inn; but there are several other places called inns, which are appendages to the former. The Temple, belonging to the two societies of the Inner and Middle Temple, is an immense assemblage of buildings, extending from Fleet-street to the Thames; and from Lombard-street, White-friars, to Essex-street in the Strand. It derives its name from a religious house, which was founded by the Knights Templars, who were crusaders; and, in the beginning of the twelfth century, formed themselves into a military body at Jerusalem, for the protection of the pilgrims who visited the holy sepulchre. On the dissolution of the order, the Temple was granted to the Knights Hospitallers of St. John of Jerusalem; and by them it was let for 10*l.* *per annum* to the students of the law, whose successors still possess it. (See HOSPITALERS and TEMPLARS.) The Temple is an irregular building: in Fleet-street are two entrances, one to the Inner and one to the Middle Temple: the latter has a front, in the style of Inigo Jones, of Ionic, ornamented with four large stone pilasters, of the Ionic order, with a pediment. There are four other entrances; but the gates of all are shut at night. The garden of the Inner Temple is of great extent, and is laid out on the banks of the Thames, with spacious walks, &c. The Middle Temple has also a garden, but small: both are open to the public in summer. The hall of the Middle Temple is a spacious and curious room: the Inner Temple hall, which is smaller, is orna-

LONDON.

mented with the portraits of several of the judges. Each society has a good library for the use of its students. In the treasury chamber of the Middle Temple is preserved a great quantity of ancient armour, which belonged to the Knights Templars. The Temple church belongs in common to both societies, and is open for divine service twice every day. The Knights Templars built a church on this site, which being destroyed, the present edifice was erected by the Knights Hospitallers. It is in the early pointed and late circular styles of architecture, and consists of two distinct parts: at the west end is a spacious round tower or vestibule, forming a grand and singular entrance to the church. In this are the statues of eleven Knights Templars. The organ is esteemed one of the finest in the world. Since the time of Henry VIII. the superior clergyman of this church is called the master of the Temple, and is so constituted by the king's letters patent. For an account of this church, with ground plan and prints, see Britton's *Architectural Antiquities of Great Britain*, vol. i.—Lincoln's Inn is situated on the west side of Chancery-lane. On its site anciently stood a house of the Black friars, and the palace of the bishops of Chichester. The ground was afterwards granted to Henry Lacy, earl of Lincoln, from whom it derives its name. It appears to have reverted to the bishops; for the present possessors hold it as a grant from a prelate of that see. Lincoln's Inn occupies a very extensive space: the buildings are mostly old and irregular. An attempt has been made, but never completed, to rebuild the Inn on a regular plan. A considerable range, called the Stone Buildings, faces the west. This plan, the work of sir Robert Taylor, is simple and elegant in its exterior architecture; and the chambers are on a grand and commodious scale. In the old part of the building are the hall and chapel; the first of which is a spacious room, in which the lord chancellor holds seals and sittings out of term. At the upper end is a painting by Hogarth, of St. Paul before Felix. The chapel, designed by Inigo Jones, is spacious, and raised on large piers and arches, which form an open area beneath, used as a burial-place for benchers only. The chapel is open for public worship every morning and evening. The garden, which in summer is open to the public, is spacious, and forms one of the finest promenades within the city. Lincoln's Inn has a good library, which contains a great number of manuscripts; the greater part of which was bequeathed by lord Hale, with a singular injunction, that no part should ever be printed. Gray's Inn is situated on the north side of Holborn, and derives its name from a lord Gray, who resided here. In this Inn is a small neat chapel, a commodious hall, and an extensive garden, with a grove of large elm trees. The inns of chancery, which are dependent on the inns of court, are Furnival's Inn, an appendage to Lincoln's Inn: it is situated on the north side of Holborn-hill, and was the mansion of sir William le Furnival, in the time of Richard II.—Thavies Inn, also dependent on Lincoln's Inn: the old fabric having been recently burnt down, a neat range of buildings is erected on its site, which is near St. Andrew's church, Holborn.—Staple Inn, situated on the north side of Holborn, and an appendage to Gray's Inn: in the hall are casts of the twelve Caesars, and portraits of Charles II., queen Anne, lord Charles Field, and the lords chancellors Cowper and Campbell.—Barristers' Inn, situated near Fetter-lane, Holborn, and a large edifice on Gray's Inn.—Sergeants' Inn, in Chancery-lane, is built in a full neat chapel, with casts for the judges.—Clarendon's Inn, situated near St. Dunstons' church, Fleet-street, and an appendage to the Inner Temple: in the

hall is an oak case, of very great antiquity.—Clement's Inn, near St. Clement's church in the Strand, a dependent on the Inner Temple: it contains an elegant hall, and a garden kept with particular care, in which is a sundial, supported by a kneeling figure of considerable merit, brought from Italy by lord Clive.—New Inn, adjoining to the last mentioned, and an appendage to the Middle Temple.—Lyon's Inn, situated in Wych Street, and belonging to the Inner Temple. For historical and descriptive particulars of these establishments and buildings, the reader is referred to Dugdale's "*Origines Juridicales*," folio, 1680; Herbert's "*Antiquities of the Inns of Court and Chancery*," 8vo 1804; and Lane's "*Student's Guide to Lincoln's Inn*," 8vo.

General remarks.—Before closing this interesting and important article, it seems proper to offer a very few remarks on the characteristic features of the metropolis, the manners and condition of its inhabitants, and the local peculiarities by which it is distinguished. Such observations, however, the reader will readily perceive must be extremely general indeed. The subject is too various and comprehensive to admit of full developement in a section, such as the nature and limits of a work of this kind necessarily prescribe.

The vast extent of London, and its immense population, cannot fail to strike every visitor with wonder and astonishment. Even to those who have previously resided in Paris, or in any other large city, these circumstances alone must be matter of surprise; for not only is this city far more extensive than the imperial metropolis, but it contains at least 400,000 more persons. These, like the inhabitants of all great trading cities, are a heterogeneous mass, composed of foreigners from every town and province of the united kingdoms, with a large portion of Jews, both native and foreign, Indians, Germans, French, Italians, Spaniards, Swifs, and people of almost every nation in the world. From its immense trade, foreign and internal, a constant communication is kept up with every part of the globe, as well as with every part of our own dominions, both at home and abroad. The quantity of property of every description flowing into the metropolis, and distributed from it, is immense. The number of strangers constantly here, either on business or for pleasure, is supposed to be not less than 100,000. Hence the prodigious concourse of people in the streets, and the number of carriages, carts, and other vehicles, continually crowding through them, are unparalleled in any city in the world.

London, in its usual and more extensive application, contains two cities, London and Westminster, besides the borough of Southwark. The city of Westminster was formerly entirely detached from London, for the street now denominated the Strand was, at no very distant period, a sort of bog, or morass, by which they were separated. The nobles of England have, for several centuries, fixed upon this city as their court residence, and the seat of the legislative and judicial authorities. This portion of modern London, and its suburbs have extended with more rapidity than any other district of the town. Its buildings are in a much superior style of architecture, and more open and regular in their distribution and arrangement, than those in the city of London. They are chiefly inhabited by the nobility, gentry, and higher class of merchants, and though perhaps even inferior in external appearance to the residences of the nobles in some other countries, are no where finer and more splendid and magnificent. London, within the walls, is the great repository of the mercantile wealth,

wealth, not merely of the metropolis, but of the whole country. Hence the buildings themselves bear ample testimony to the object for which they were raised. Almost every house is a shop, or a counting-house, and so closely are they huddled together, that in many places room is scarcely left for the passage of a single cart. Ground is valuable, and is fully occupied. This renders it certainly a matter of regret, and the remark is applicable to every part of the town, that there exist no regulations, or general plan authorized by act of parliament, to which all builders should be obliged to conform. Such a plan, it is believed, was suggested by sir Christopher Wren after the great fire in 1666, and since by Gwynn, in a quarto volume, entitled "London and Westminster improved, &c."

In a political point of view, London bears a most important sway in deciding the opinions of the country at large. It is the centre from which all information, civil or military, emanates. The number of newspapers and other political vehicles distributed here, and hence over the united kingdom, is prodigiously great. The foreigner who peruses a few of these, cannot but be astonished at the opposite sentiments they contain, and the freedom with which they praise or censure the measures of government. This is the consequence of liberty, and is doubtless one of its chief supports. The ruling magistrate of the kingdom is not exempt from public censure and critical animadversion. At the commencement of the year 1812, this is more notorious than at any former period; and future historians will have occasion to explain the cause and lament the effect. Not only has London a powerful influence over the political sentiments of the country, but it has likewise no inconsiderable share in directing the conduct of the higher powers. This it effects in some degree by the members it returns to parliament, which are six in number, but much more by the influence and riches of some of its chartered companies, as well as individuals. The bank of England, mostly a body of merchants, is closely identified with government. The minister is compelled to have recourse to the citizens for supplying the deficiencies in the revenue, by loan, all which circumstances render it necessary for the government to pay peculiar attention to the interests of the city in general.

London may further be characterized as the grand theatre for the display of talents either in the arts or sciences. It is here alone, perhaps, of all the cities in the united kingdom, that literary ability will receive any adequate reward. The artist of genius will likewise in general meet here with support and encouragement. He will here find the finest productions of the most celebrated masters in every department of art, by the study of which alone it is possible for him to attain the praise of excellence. In London are to be seen the best actors, and the most splendid theatres, Great Britain can boast of. The talents of the vocal and instrumental performers at the opera and concerts are unrivalled, and probably no city in Europe possesses a place of public amusement more brilliant and magnificent than Vauxhall. London likewise abounds with museums, also various scientific, literary, and rational establishments.

The merchants, bankers, and higher classes of tradesmen, bear a strong resemblance in manners to the gentry with whom, from their immense wealth, they are generally accustomed to associate. The same wealth, and the greater security they possess for its enjoyment than the merchants of other countries, confer upon them a spirit of real indepen-

dence, to which the latter are totally strangers. From this spirit of independence many advantages have undoubtedly arisen both to the political condition and commercial prosperity of England. Reacting as it were upon the springs of our free constitution, from which it proceeds, it tends to render them vigorous and effective. Britons justly boast of their trial by jury as the bulwark of their freedom, but of what use would juries be, if the individuals who compose them were dependent and submissive. It is to the spirit of the people rather than to any particular forms of administration that a country is indebted for its freedom.

The nobility and gentry of London are of a very different complexion from the same classes in other countries. They possess the highest polish of manners, but unite with their accomplishments a degree of manliness and moderation, the result of the freedom of the English constitution and the general diffusion of riches. A foreign nobleman considers himself as a distinct species of being from those who are his inferior in rank and station, and consequently treats them with arrogance and contempt. An English nobleman, on the other hand, while sufficiently conscious of his own superiority, behaves towards those whom fortune has placed beneath him with real attention and civility; even in the article of dress he is scarcely to be distinguished from the ordinary tradesman or mechanic, while the higher class of merchants fully equals him in the splendour of his equipages and establishments. He is almost wholly a stranger to that indolence which usually results from excessive wealth and hereditary titles. Even the ladies of high rank are much less enervated and feeble than most of the same class abroad. They are accustomed to much exercise, and to mix in the public world.

The beneficial operation of this spirit on our commerce is the consequence of that honour and integrity, which are uniformly found to accompany elevation of mind. That honesty is the best policy, has long been an undisputed dogma in commercial transactions in London. Hence it is that an English merchant can often obtain credit even in foreign countries, where it is little practised, and bills of immense value are sometimes entrusted to him without receipt or acknowledgment. But these remarks ought not to be considered as applicable to the higher orders of traders only. The same freedom of conduct and sterling integrity are prominent features in the character of the generality of established shop-keepers, particularly those of the city.

With respect to physicians, surgeons, and barristers, they may be ranked with the gentry, though influenced by some little peculiarity of habits and manners. Apothecaries and attornies may be classed with the better sort of shop-keepers.

The labouring classes in London are usually of industrious and frugal habits. Their dress and appearance are far more decent and respectable than in any other city in the world, and this alone is a sufficient evidence of its great trade and wealth. The same thing may be said of the poorer sort of shop-keepers, who, from the rate of their earnings, may be placed in the rank of labouring people. Male and female servants, in plain and honest families, may likewise be thrown into this rank with a similar character.

Among many essential improvements recently made in London, the following are worthy of notice and commendation. In the city, and at the east end of the town, we find that new docks have been made on a vast scale, whereby
the

the property of merchants, companies, and the government is, and will be, materially benefited. Many commodious streets and new houses have also been made in the vicinity of those docks, so that from the Tower to Limehouse a new town has been formed. All the great roads leading to London have been much improved, and every approach to the metropolis, excepting that through the Borough, is broad, good, and flanked by handsome rows of houses, or detached villas. In the city, and immediately adjacent, a wide and handsome street, called Skinner-street, has been entirely new built; a handsome square formed in Moorfields, other streets made near Temple Bar, several new buildings erected around the Bank, and others on Tower-hill. In Mary-le-bone a new plan is executing of laying out a large park into various allotments of detached villas, with gardens and pleasure grounds, by John Nash, esq. architect. The destruction of the two great theatres by fire has afforded opportunities for much improvement, and much has been effected. North of Holborn many new squares and streets have been built, the greater part of which has been designed by James Burton, esq. In subsequent accounts of MARY-LE-BONE, PADDINGTON, and WESTMINSTER, many other subjects will be described.

Publications relating to London and Westminster.—Though many volumes have been expressly devoted to the history and topography of the metropolis, it is generally admitted, and much to be regretted, that not one work is satisfactory either as a comprehensive history, or popular and general description. The most elaborate, and the most complete at the time of publication, is Strype's edition of Stow's "Survey of London," 2 vols. folio, sixth edition, 1754: but this is merely a reprint of a former edition of 1720. As a sort of guide, or popular account of the present metropolis, "The Picture of London for 1812," called "the thirteenth edition," is best adapted to furnish a stranger with a view of London 'as it is': but this, though admirably planned, and well executed in parts, is replete with errors of names, dates, and events. Many of its strictures are objectionable on points of art, taste, and antiquities; and one section on reviews and literary criticism is unjust, and of injurious tendency. The most essential points of these two works, with much additional information, will be comprised in Brayley's "London and Middlesex; or, An historical, commercial, and descriptive Survey of the Metropolis of Great Britain," now in the progress of publication, and promised to be completed in two large octavo volumes. The following are the titles of the other principal works relating to the topography of the metropolis.

"The History of London, from its Foundation by the Romans, to the present Time," by William Maitland, F.R.S. and others, 2 vols. folio, 1765.

"A new and complete History and Survey of the Cities of London and Westminster, the Borough of Southwark, and Parts adjacent," to the year 1770, by Henry Chamberlain, esq. and a society of gentlemen.

"A new History of London, including Westminster and Southwark," by John Noorthouck, citizen and stationer, 4to. 1773.

"Repertorium Ecclesiasticum," by ——— Newcourt, 2 vols. folio. 1708.

"Londinopolis, or An historical Discourse of the City of London," by Howell, folio, 1657.

"A picturesque Tour through the Cities of London and Westminster," by Thomas Malton, folio, 1792.

"Londinium Redivivum, or An ancient History and modern Description of London," by James Peller Malcolm, F.S.A. 4 vols. 4to. 1807.

"Some Account of London," by Thomas Pennant, esq. 4th edition, 4to. 1805.

"The Customs of London, otherwise called Arnold's Chronicle," new edit. 4to. 1811.

"London; being an accurate History and Description of the British Metropolis, and its Neighbourhood," 6 vols. 8vo. said to be by David Hughson; but really compiled and written by David Pugh. This mode of giving fictitious names is very reprehensible.

"London and Westminster improved, with a Discourse on public Magnificence," by John Gwynn, 4to. 1766.

"A critical Review of the public Buildings, Statues, and Ornaments, in and about London and Westminster," by ——— Ralph, architect, a new edition, 12mo. 1783.

"A Treatise on the Police of the Metropolis; containing a Detail of the various Crimes and Misdemeanors by which public and private Property and Security are injured; and suggesting Remedies for their Prevention," by P. Colquhoun, L.L.D. 8vo. Several editions have been published.

"A Treatise on the Commerce and Police of the River Thames; containing an historical View of the Trade of the Port of London, and suggesting Means for preventing Depredations thereon, &c. With a Map of the River from London Bridge to Sheerness," by P. Colquhoun, L.L.D. 8vo.

"A Treatise on the Functions and Duties of a Constable; containing interesting Details and Observations, relative to the Corruptions of Morals, and the Protection of the peaceful Subjects against penal Offences," by P. Colquhoun, L.L.D. 8vo.

"The Thames; or, Graphic Illustrations of the Seats, Villas, &c. on the Banks of that River," 2 vols. 8vo. 1811. chiefly a book of prints.

"The History of London and its Environs," 2 vols. 4to. published by John Stockdale.

It appears from Mr. Kirwan's "Estimate of the Temperature of different Latitudes," that from a mean of the observations made at the house of the Royal Society, from the year 1772 to 1780, the annual temperature of London is 51.9, or in round numbers 52; the monthly temperature is stated in the following table:

January	-	35.9	July	-	66.3
February	-	42.3	August	-	65.85
March	-	46.4	September	-	59.63
April	-	49.9	October	-	52.81
May	-	56.61	November	-	44.44
June	-	63.22	December	-	41.04

The greatest usual cold is 20°, and happens in January; the greatest usual heat is 81°, and happens generally in July. The limits of the annual variation are 2.5; that is, 1° above and 1.5 below the mean.

The greatest variations of the mean temperature of the same month, in different years, are as follows:

January	-	6°	July	-	2°
February	-	5	August	-	2
March	-	4	September	-	3.5
April	-	3	October	-	4
May	-	2.5	November	-	4
June	-	2	December	-	3

Hence—

Hence it appears that the summers differ much less than the winters.

The most usual variations of temperature within the space of 24 hours in every month, are

January	- 6°	July	- 10°
February	- 8	August	- 15
March	- 20	September	- 18
April	- 18	October	- 14
May	- 14	November	- 9
June	- 12	December	- 6

Hence is seen the origin of vernal and autumnal colds.

Mr. Kirwan has shewn that, proportionably to its latitude, it is much colder in London than at Edinburgh; for the mean temperature of Edinburgh in January is $34^{\circ} 5$, and that of London is $35^{\circ} 9$; and this difference he ascribes to the following causes: 1st. That Edinburgh is not exposed to the Siberian winds as London is. 2dly. That Edinburgh is nearer to the sea. 3dly. The rigour of the northerly winds is very little moderated, if not increased, in passing from Scotland to us, particularly if the surface of the earth is covered with snow; and hence, if we believe Dr. Smollet (*Travels to Italy*), the winters are sometimes milder at Edinburgh than at London.

LONDON, a town of America, in Ann-Arundel county, Maryland; 5 miles S.W. of Annapolis.

LONDON, *The township of*, is situated in Upper Canada, on the main fork of the river Thames, in a central position from the lakes Erie, Huron, and Ontario, and offers many advantages for being the capital of the province. It communicates with lake St. Clair and the Detroit by the river Thames; with lake Huron by the northern branch of the Thames and a small portage, and with the Ouse and lake Ontario by the military way called Dundas-street. It abounds with black and white walnut, cherry, bass, elm, hickory, beech, ash, and many other kinds of timber. It is supplied with excellent water, and the situation is healthy.

LONDON *Cove*, a narrow water of Long island found, which sets N. into the township of New London; 4 miles W. of the mouth of Thames river.

LONDON *Harbour*, a bay and harbour on the N. coast of the island of St. John, in the gulf of St. Lawrence. N. lat. $46^{\circ} 26'$. W. long. $67^{\circ} 8'$.

LONDON, *New*. See *New London*.

LONDON *Pride*, in *Gardening*, the name of a well-known plant of the flower-kind. See *SANIERAGA*.

LONDONDERRY, in *Geography*, a county of Ireland, in the province of Ulster. It lies to the west of Antrim, from which it is in a great measure separated by the river Bann. Lough Neagh washes it on the south-east; on the south it has Tyrone, from which it is separated, in part, by the little river Bellinerry; on the west it has Donegal and Lough Foyle; and on the north, that part of the Atlantic ocean which is sometimes called the Deucalionian sea. A great part of it was given by James I. to the twelve London companies, on condition of their fortifying the towns of Derry and Coleraine. From this circumstance, both the county and town were called by the name of Londonderry. It extends 32 Irish miles from north to south, and about the same from east to west, where it is broadest. This length and breadth are equal to 441 English miles. It measures in area 318,500 Irish acres, and 479 square miles, which, in English measure, are 511,688 acres, and 792 square miles. It contains 31 parishes.

riches, which have 29 churches, mostly in the diocese of Derry; which see.

Londonderry is in general very mountainous, excepting the eastern part, adjoining Lough Neagh and the river Bann. The principal hills are Benyvenagh in the north; Slieve-Gallen in the south; Cairntogher, which sometimes gives name to the chain extending into the county of Tyrone, and Sawell on the borders of the same county. The highest of these, however, is not more than 1600 feet above the level of the sea. The face of the country, near the sea and the river Bann, bears a great resemblance to that of the adjoining county of Antrim. Basaltes, intermixed with zeolite, is found on a bed of white limestone, which is sometimes concealed by the basaltes, and sometimes shows itself in steep and elevated rocks, especially in Benyvenagh, and the adjacent forelands. The ground about Lough Foyle is, in general, a strong loam, which is well adapted for wheat, barley, flax, and potatoes, and which is principally manured by the shells procured from the lough. The land in the vallies does not considerably differ, except in nature, shells being at too great a distance; a circumstance which is, in some measure, recompensed by the deposits from the mountain torrents. The river Roe, which passes through the middle of the county to Lough Foyle, is thought to separate the basaltic region from the schistose or slate. There are in the latter various kinds of schist; and with them are found pudding stone, gneiss, and blue limestone. Schistose is found universally under the basaltes, and occasionally intermingled with schist. Iron is in great abundance throughout the county, either in an ochreous state, or mixed with manganese. It was formerly smelted by an agent of the Drapers' company, but the speculation was unsuccessful. Beate mentions gold found in Londonderry; and some specimens of quartz containing thin leaves of gold are said to have been lately met with (A. D. 1822); they were found on the surface, and supposed to be adventitious. The siliceous, or flinty matter, like the calcareous, has two distinct appearances, which denote the regions of which they are the natives. The silica in the schist country is in the character of quartz, and the lime of the same country is bluish and laminated. In the basaltic country the silica is in the character of flint, including chalcedony, &c.; and the lime white, and abounding in marine substances. Both the quartz and flint are of various tings. The former sometimes clear, yellow, brownish, reddish, &c.; the latter horn-coloured, purple, brownish black, &c. The flint has sometimes marine impressions; the quartz never. Rock crystals of great hardness, and weighing from one ounce to twelve, are found in the schistose region. The grass which is most prevalent in this county is the *Agrostis stolonifera*, called in Irish *florin*, and so strongly recommended for cultivation by Dr. Richardson. It is peculiarly luxuriant in low meadows. The soft meadow grass (*Holcus mollis*), is thought to be next in value and predominance, and is that generally sown. The variety, however, found in other counties, is not wanting in this. Of other vegetables, the most remarkable is the Lichen lomphaloides, which, when manufactured, is called litmus, turnsole, and archil. This is found on the rocks in great abundance, and is used both for dyeing purple, and in a simple watery decoction, for giving woollen goods, such as flannels, an orange-red colour. The flints near the river Bann have a greater extent of bog than is at present necessary for fuel, which bog is in general very reclaimable. Both this part of the county and the mountainous district require much improvement. Some young cattle are reared on the mountains, and some sheep fed.

The linen manufacture is carried on extensively through every part of the county. Londonderry is well watered by several streams. Of these the Bann flows from Lough Neagh, and forms the eastern boundary, till it approaches the town of Coleraine, when it ceases to be a boundary, flowing through the liberties of that town into the sea about three miles below it. About a mile above Coleraine is a ridge of rocks called the Salmon Leap, at which weirs are built for the salmon-fishery. Great quantities of this fish are caught in the Bann, and being salted at Coleraine form a valuable article of commerce. There is also an eel-fishery at Toome, between Lough Beg and Lough Neagh, which, as well as the other, is very valuable to the proprietor. The Foyle, a wide and deep river, having divided the counties of Tyrone and Donegal, and received several smaller, enters this county a little above the city of Londonderry, and passing by it expands into that large saltwater lake, known by the name of Lough Foyle. The rivers Fahan and Roe rising in the Cairntogher mountains also flow into this lough. Several other streams join the Bann in its course, or increase the waters of Lough Neagh; amongst the latter is the Moyowla. In tracing the coast from the little harbour of Portrush, in Antrim, we first meet with Bannhaven at the mouth of the Bann, about three miles from which is the town of Coleraine. (See COLERAINE.) Proceeding along the coast, Magilligan Point, at the extremity of a large sandy tract, presents itself, approaching the coast of Donegal, and thus forming the entrance of Lough Foyle. Between Benyevanagh mountain and this point is a warren, which yields, on an average, three thousand dozen of rabbits each year. The sale of the skins, which are sent to Dublin, produces a large revenue to the proprietor. Near this point is the Tons, a sand-bank not far from the entrance of the lough, on which the sea sometimes beats with a prodigious noise. The entrance of Lough Foyle is not above half a mile wide, so that it is land-locked on all sides. It is a large oval basin, twelve miles long, and near seven broad in the widest part, but it has only one deep channel in the middle between long shoals or banks of sand. It is, nevertheless, on the whole, a safe, large, and commodious harbour. Near the mouth of the river Roe, which runs into the lough, is a ridge of stones mixed with shells and sand, extending a mile and a half in length, which is called the Giant's Grave. There are other banks of the same kind at a greater distance from the lough, which renders it probable, that this part of the county was once overflowed by the sea. The county town, called also Londonderry, is on the Foyle. (See next article.) Other towns are, Newtown Limavaddy, Magherafelt, and Money more. Londonderry returns three members, two for the county and one for the city. Sampson's Statistical Survey, and Beaufort's Memoir.

LONDONDERRY, the capital of the county described in the preceding article: it is on the river Foyle, over which it has a wooden bridge, 1068 feet in length, and of singular and excellent construction. It is a well built and neat city, and has a general appearance of order, industry, and sobriety. It contains about 10,000 inhabitants. Its trade is considerable, especially with America; the exports are linen, linen-yarn, &c. In the time of queen Elizabeth, Derry was a considerable military station, being well fitted for keeping the adjoining country in subjection. In the reign of James I. it was rebuilt and strengthened by the citizens of London, to whom it was given by that monarch. In the rebellion of 1641, and the succeeding years, it was twice besieged, but without success; but it is most cele-

brated in history for the siege nobly sustained by the inhabitants in 1688 and 1689, for 105 days against the army of King James, although pressed by a very severe famine. It deserves to be recorded, that when the military governor was inclined to give up further resistance, the inhabitants, incited by the Rev. George Walker, whom they chose governor, took it upon themselves, and have thus gained immortal renown. Londonderry is still surrounded by walls and has a military governor, who is also commander of Culmore fort. (See CULMORE.) Londonderry is a post-town, and returns a member to parliament. It is 115 miles N. by W. from Dublin. N lat 55. W. long. 7° 13'. Sampson, &c.

LONDONDERRY, a post-town of America, in Rockingham county, New Hampshire, near the head of Beaver river, which discharges itself into Merrimack river, at Pawtucket Falls, settled in 1718, incorporated in 1722, and containing 2650 inhabitants. The inhabitants are mostly the descendants of emigrants from Ulster county, Ireland, and are employed in the manufacture of linen cloth and thread; 30 miles S.W. by S. from Portsmouth.—ALLO, a township in Halifax county, Nova Scotia, on the N. side of Cobequid or Colchester river, about 30 miles from its mouth, at the basin of Minas; settled by North Irish and Scotch.—ALLO, a township in the N.W. part of Windham city, Vermont, on the head waters of West river, about 33 miles N.E. of Bennington. In 1795 it was divided into two parts, the E. half being called *Windham*, and the W. part retaining its original name.—ALLO, two townships in Pennsylvania; one in Dauphin county, containing 1577 inhabitants, the other in Somerset county, having 709 inhabitants.

LONDONGROVE, a township in Chester county, Pennsylvania, containing 921 inhabitants.

LONDRES, or LONDON, a town of South America, in the province of Tucuman, built by Tarita, the governor, in 1555, in compliment to Mary, queen of England, then married to Philip, king of Spain. S. lat. 19 12'.

LONEE, a town of Hindoostan; 12 miles E.S.E. of Poonah.

LONEL, a town of the island of Sardinia; 22 miles S.E. of Bosa.

LONER, a town of Hindoostan, in Baglana; 16 miles N.W. of Chander.

LONERSTATT, a town of Bavaria; 14 miles S.S.W. of Bamberg.

LONG, JAMES LE, in *Biography*, a learned French priest, was born at Paris in 1665. In 1686 he entered into the congregation of the Oratory, and occupied the post of professor in several houses of that society, and finally was appointed their librarian at St. Honoré. He passed his life in learned labours, and died in 1721, with the character of a virtuous and estimable man. He was thoroughly conversant in the ancient and many of the modern languages, and had an extensive acquaintance with the history of literature, of bibliography, and printing. His chief work is entitled "*Bibliotheca Sacra*," containing a catalogue of all the editions and translations of the scriptures, in two volumes octavo, to which he subjoined, in a second part, a list of all the authors who had written upon the scriptures. He published, likewise, "*Bibliothèque Historique de la France*," being an account of all the historical works relative to that country, which is highly esteemed, and ranks among the great productions of the reign of Lewis XV.; also a "*Historical Discourse on Polyglott Bibles*," and their several editions.

LONG,

LONG, ROGER, an English divine, and astronomical professor, was born in 1679, received his college education at Cambridge, and became master of Pembroke-hall, and Lowndes's professor of astronomy. He is chiefly known as an author, by a *Treatise on Astronomy*, in two volumes; the first of which was published in 1742, and the second in 1764. He was the inventor of a curious astronomical machine, erected in a room at Pembroke-hall. This is a hollow sphere about eighteen feet in diameter, in which thirty persons may sit. The concave surface represents the heavens with the stars and constellations in their order; the axis is placed parallel to the axis of the world, upon which it is easily turned by a winch. (See *CONSTELLATION*.) He published a Commencement Sermon, and an Answer to Dr. Galley's pamphlet "On Greek Accents." He died in the year 1770, at the age of eighty-one.

LONG, THOMAS, a learned divine, was born at Exeter in 1621, and educated at the college of that name in Oxford. His highest preferment in the church was a prebend in Exeter cathedral, of which he was deprived at the Revolution for refusing the oaths. He died in 1700. He was author of many theological pieces; of a *Life of Julian*; *History of all the Popish and Fanatical Plots and Conspiracies*; and a *Vindication of the Claim of King Charles I. to the Authorship of the Eikon Basilike*.

LONG Accent. See *ACCENT*.

LONG Bay, in *Geography*, a bay on the E. coast of Jamaica. N. lat. $18^{\circ} 8'$. W. long. 76° .—Also, a bay on the W. coast of the island. N. lat. $18^{\circ} 20'$. W. long. $78^{\circ} 21'$.—Also, a bay on the S. coast of the same island; six miles E. of Calibash bay.—Also, a bay of America, extending along the shore of N. and S. Carolina, from Cape Fear to the mouth of Pedee river.—Also, a bay on the W. side of the island of Barbadoes.—Also, another on the S. side of the island.

LONG Boat, the largest and strongest boat belonging to a ship. See *BOAT*.

LONG Hand. See *LONG HAND*.

LONG-horned Cattle, in *Agriculture*, a breed of neat cattle, which is chiefly distinguished by the length of the horn, the thickness and firm texture of the hide, the length and closeness of the hair, the large size of the hoof, and the coarse leathery thickness of the neck. It is sometimes termed Lancashire breed from its being predominant there. See *CATTLE*.

LONG-jointed, in the *Manege*. A horse is said to be long-jointed, whose pattern is slender and pliant. Long-jointed horses are wont to have wind-galls.

LONG Island, in *Geography*, an island in Penobscot bay. (See *ISLEBOROUGH*.)—Also, an island of America, on the coast of Maine, 4 miles long and $1\frac{1}{2}$ wide. N. lat. $44^{\circ} 20'$. W. long. $68^{\circ} 20'$.—Also, an island near the S. coast of Jamaica. N. lat. $17^{\circ} 51'$. W. long. $76^{\circ} 58'$.—Also, an island near the N. coast of the island of Antigua. N. lat. $17^{\circ} 17'$. W. long. $61^{\circ} 28'$.—Also, an island in Hudson's Straits. N. lat. 61° . W. long. 75° .—Also, another in Hudson's bay. N. lat. $55^{\circ} 16'$. W. long. $78^{\circ} 30'$.—Also, a narrow island about two miles in length, on the S. coast of the county of Cork, Ireland, in Roaring-water bay. It contains 316 acres of land. N. lat. $51^{\circ} 26'$. W. long. $9^{\circ} 27'$.—Also, one of the smaller Bermuda islands.—Also, a small island in the gulf of Mexico, near the coast of East Florida. N. lat. $27^{\circ} 50'$. W. long. $82^{\circ} 55'$.—Also, a small island near the coast of S. Carolina. N. lat. $32^{\circ} 50'$. W. long. $79^{\circ} 45'$.—Also, a small island near the coast of Virginia, at the mouth of York river. N. lat. $37^{\circ} 16'$. W. long. $76^{\circ} 35'$.—Also, a small

island in the Atlantic, near the coast of Brasil. S. lat. $16^{\circ} 30'$.—Also, an island of America, formerly called "Manhattan," afterwards "Nassau island," discovered by Henry Hudson, an Englishman, in 1609, and belonging to the state of New York. It extends from Hudson river, opposite to Staten island, almost to the western boundaries of the coast of Rhode island, terminating with Montauk point. Its length is about 140 miles, and its medial breadth from 10 to 14 miles; and it is separated from Connecticut by "Long island Sound." It contains 1400 square miles, and is divided into three counties, viz. King's, Queen's, and Suffolk; and these are again subdivided into 19 townships. The N. side of the island is rough and hilly, but the soil is well adapted for raising grain, hay, and fruit. The S. side of the island lies low, and its soil is light and sandy. On the sea-coast are extensive tracts of salt-meadow, which extend from Southampton to the W. end of the island. Nevertheless, the soil is well adapted to the culture of grain, especially Indian corn. Near the middle of the island is Hempstead plain, in Queen's county, which is 16 miles long, and about eight broad. This plain, the soil of which is black, and apparently rich, yields naturally a particular kind of wild grass and a few shrubs; but it produces some rye, and furnishes, together with the salt marshes, food for large herds of cattle. On the E. part of the island, E. of Hempstead plain, is a large barren heath, called Bruthy plain, overgrown with shrub oak, intermixed with a few pine-trees, which afford harbour to wild deer and grouse. In a bay on the S. side of the island, vast quantities of oysters are taken, and also of baf. The largest river in the island is Peakonok, which is but an inconsiderable stream; it runs E. and discharges itself into a large bay that separates Southhold from Southampton. In this bay are Robin and Shelter islands. Rockonkama pond lies about the centre of the island, between Smith-town and Islip; it is about a mile in circumference, and has been found to rise gradually for several years, until it had arrived to a certain height, and then to fall more rapidly to its lowest bed; and thus it is continually ebbing and flowing. Two miles to the southward of the pond is a stream called Connecticut river, which runs into the bay. There are two whale-fisheries; one from Soggharbour, which produces about 1000 barrels of oil annually. The other is much smaller, and is carried on by the inhabitants in the winter season, from the S. side of the island. They commonly catch from three to seven whales in a season, which produce from 25 to 40 barrels of oil each. This fishery was formerly a source of considerable wealth to the inhabitants, but on account of a scarcity of whales, it has of late years much declined. From Soggharbour to the West Indies and other places, there is a considerable trade in whale oil, pitch, pine-boards, horses, cattle, flaxseed, beef, &c. The produce of the middle and western parts of the island is carried to New York. The island contains 42,097 inhabitants, of whom 3893 are slaves. (Morfe.)—Also, an island in Holston river, Tennessee, five miles long, and containing 2500 acres of rich land, subject to inundations. Many boats are built here annually, and loaded with the produce of the state for New Orleans; 100 miles above Knoxville, and 1000 from the mouth of the Tennessee.—Also, a small island in the East Indian sea, near the W. coast of Billiton. S. lat. $2^{\circ} 51'$. E. long. $107^{\circ} 30'$.—Also, a small island near the S.E. coast of the island of Madeira. S. lat. $7^{\circ} 16'$. E. long. $113^{\circ} 5'$.—Also, a small island near the N. coast of the island of Flores. S. lat. $8^{\circ} 6'$. E. long. $122^{\circ} 27'$.—Also, a small island in a bay on the N. coast of New Guinea. S. lat. 104° . E. long. 135° .

18'.—*Alfo*, an island in Queen Charlotte's sound, on the coast of New Zealand, called by the natives "Hamote," about four miles long; nine miles S. of Port Jackson.—*Alfo*, an island in the South Pacific ocean, at the entrance of Broad sound, on the N.N.E. coast of New Holland, about 30 miles in length. S. lat. 22° 24'. W. long. 210° 33'.—*Alfo*, an island discovered by captain Wallis in 1767, and so called by him. N. lat. 10° 20'. W. long. 247° 24'.—*Alfo*, a small island near the W. coast of Scotland. N. lat. 56° 15'. W. long. 5° 37'.—*Alfo*, a small island in the East Indian sea, near the coast of Africa. S. lat. 10° 25'.—*Alfo*, one of the islands in the Mergui Archipelago. N. lat. 12° 26'. E. long. 98° 12'.

Long Island Sound, a kind of inland sea, from three to 25 miles broad, and about 140 miles long, extending the whole length of Long island, in the state of New York, and dividing it from Connecticut. This sound communicates with the ocean at both ends of the island, and affords a very safe and convenient inland navigation.

Long Is., or *Le River*, *Indians*, are Indians who inhabit the territory, on the White river, which runs W. into the Wabash river. The mouth of White river is in N. lat. 38° 58'. W. long. 80° 7'.

Long Key, Middle, a small island in the bay of Honduras, near the coast of Mexico. N. lat. 17° 10'. W. long. 88° 48'.

Long Key, North, a small island in the same bay. N. lat. 17° 58'. W. long. 88° 40'.

Long Key, South, a small island in the same bay. N. lat. 16° 57'. W. long. 88° 50'.

Long Konang, a town of Corea; 125 miles S.S.E. of King-ki-tao. N. lat. 35° 55'. W. long. 79° 20'.

Long Lakes, The, a chain of small lakes in Upper Canada, extending westerly from the grand portage of Lake Superior toward Rain lake.

Long Legs, in *Natural History*. See *TIPULA*.

Long Meadows, in *Geography*, a town of America, in Hampshire county, Massachusetts, on the E. bank of Connecticut river, about four miles S. of Springfield, and 23 N. of Hartford; incorporated in 1783, and containing a congregational church, and about 70 houses, forming a street parallel with the river. The township contains 973 inhabitants.

Long Measure. See *MEASURE*.

Long Mountain, in *Geography*, a mountain of Virginia; 80 miles W.S.W. of Richmond. N. lat. 37° 15'. W. long. 79° 20'.

Long Nose, a cape on the E. coast of New Holland. S. lat. 35° 0'. E. long. 151° 15'.

Long Point, is a long beach or sand bank, on Lake Erie, in Upper Canada, now called the "North Foreland," stretching into Lake Erie from the township of Walsingham, and forming the deep bay of Long Point, upwards of 20 miles in length.

Long Pond. See *BRIDGE-TOWN*.

Long Reach, a narrow part of the straits of Magellan, between Cape Quod and Buckley Point.

Long Reef, a shoal in the Spanish Main, near the Mosquito shore. N. lat. 12° 22'. W. long. 82° 50'.

Long Saut, a small island of Upper Canada, in the river St. Lawrence, in front of the township of Osnabrock, containing from 1000 to 1500 acres, with good soil. N. lat. 55° 2'. W. long. 74° 55'.

Long Shoal, a river of America, in North Carolina, which runs into Pamlico sound, at the mouth of which is a cape called *Long Shoal Point*. N. lat. 35° 22'. W. long. 76° 2'.

Long Timbers, or *Double Futtocks*, in a *Ship*, those timbers afore and abaft the floors which extend from the deadwood to the run of the second futtock head.

LONGA, in *Geography*, one of the smaller Shetland isles. N. lat. 60° 12'. W. long. 1° 37'.—*Alfo*, a small island near the W. coast of Scotland. N. lat. 56° 12'. W. long. 50° 40'.

LONGA, Ital. *Longue*, Fr. *A long*, Engl. in *Music*, is a character for time in the first time-table, half the duration of the *maxima*, or *large*, and twice the length of the *breve*.

The long is formed thus:  or  John de Muris

and his contemporaries had longs of three several kinds; the

perfect, with a tail on the right side, thus  or 

equal to three pointed breves; it is called *perfect*, says de Muris, on account of its numerical ratio with the Trinity. The *imperfect* long is of the same figure as the *perfect*, and is only distinguished by the mood or character for time at the beginning of a movement. It was accounted *imperfect*, from its being incomplete without a breve to precede or follow it. The *double* long contains two imperfect breves:

it is like the long only of a much larger size 

John de Muris quotes Aristotle to prove that this note is not used in canto fermo. At present, the term long is only correlative with *short*, in scanning verses.

LONGABOO, in *Geography*, one of the smaller Friendly islands; 12 miles E.S.E. of Naenava.

LONGARA, a town of Naples, in Calabria Ultra; 20 miles W.N.W. of Severina.

LONGARES, a town of Spain, in Aragon; 20 miles S.S.W. of Aragossa.

LONGAY, a small island near the E. coast of Skye. N. lat. 57° 19'. W. long. 5° 53'.

LONGEAU, a town of France, in the department of the Upper Maine, and chief place of a canton, in the district of Langres; six miles S. of Langres. The place contains 428, and the canton 9485 inhabitants, on a territory of 295 kilometres, in 29 communes.

LONGEPIERRE, HUBAHE-BERNARD DE ROQUELEYNE, *Lord of*, in *Biography*, born of a noble family at Dijon, in 1659, was secretary of commands to the duke of Berry. He distinguished himself by an accurate knowledge of the Greek language, and published notes upon Anacreon, Sappho, Bion, Moschus, and the Idylls of Theocritus. In 1690 he gave the public a collection of "Idylls" of his own invention: he was author of the tragedies of "Medea," and "Electra," written after the manner of the Greek tragedians, which were brought on the stage, and gave him a reputation among dramatic poets. He wrote other tragedies of considerable merit, and died at Paris in 1721. Mereri.

LONGEPIERRE, in *Geography*, a town of France, in the department of the Saône and Loire, situated near the river Doubs; 16 miles N.E. of Chalons sur Saône.

LONGERI, a town of Africa, in the kingdom of Loango, where the kings are generally interred.

LONGEVITY, a term expressing length of life.

From the different longevities of men in the beginning of the world, after the flood, and in these ages, Dr. Derham deduces a good argument for the interpolation of a Divine Providence.

LONGEVITY.

Providence. Immediately after the creation, when the world was to be peopled by one man and woman, the ordinary age was nine hundred years and upwards. Immediately after the flood, when there were three persons to stock the world, their age was cut shorter; and none of those patriarchs, but Shem, arrived at five hundred. In the second century we find none that reached two hundred and forty; in the third, none, but Terah, that came to two hundred years; the world, at least a part of it, by that time being so well peopled, that they had built cities, and were cantoned out into distant nations. (See ANTEDILUVIAN.) By degrees, as the number of people increased, their longevity decreased, till it came down at length to seventy or eighty years; and

there it stood, and has continued to stand, ever since the time of Moses. This is found a good medium, and, by means hereof, the world is neither overstocked, nor kept too thin; but life and death keep a tolerably equal pace. So that from this period the common duration of man's life has been much the same in all ages, as we learn both from sacred and profane history. In consequence of the relation of the ingenious Mr. Whitchurch (see *Phil. Inquiry into the Origin of the Earth*), and of Dr. Barrow's *Remarks on Longevity in the Manchester Memoirs*, vol. ii. we are enabled to present our readers with tables of longevity, and appropriate reflections, which will be no less instructive than amusing.

TABLE I.

Names of the Persons.	Ages.	Places of Abode.	Living or Dead.
Thomas Parre - - -	152	Shropshire - - -	Died Nov. 16, 1625, <i>Phil. Trans.</i> N. 14.

LONGEVITY.

If we look to an early period of the Christian era, we shall find that Italy has been, at least about that time, peculiarly propitious to longevity. Lord Bacon observes, that the year of our Lord 76, in the reign of Vespasian, was memorable; for in that year was a taxing, which afforded the most authentic method of knowing the ages of men. From it, there were found in that part of Italy, lying between the Apennine mountains and the river Po, one hundred and twenty-four persons who either equalled or exceeded one hundred years of age, namely:

TABLE II.

	54	Persons of	100	Years each.
	57	-	-	110
	2	-	-	125
	4	-	-	130
	4	-	-	136
	3	-	-	140
In Parma	3	-	-	120
	2	-	-	130

In Brussels	1	-	-	125	Years each.
In Placentia	1	-	-	131	
In Faventia	1	-	-	132	
	6	-	-	110	
	4	-	-	120	
In Rimino	1	-	-	150	<i>viz.</i> Marcus Aponius.

Mr. Carew, in his Survey of Cornwall, assures us, that it is no unusual thing, with the inhabitants of that county, to reach ninety years of age, and upwards, and even to retain their strength of body and perfect use of their senses. Besides Brown, the Cornish beggar, who lived to one hundred and twenty, and one Polezew to one hundred and thirty years of age; he remembered the decease of four persons in his own parish, the sum of whose years, taken collectively, amounted to three hundred and forty. Now, although longevity evidently prevails more in certain districts than in others, yet it is, by no means, confined to any particular nation or climate; nor are there wanting instances of it, in almost every quarter of the globe, as appears from the preceding, as well as the subsequent table.

TABLE III.

Names of the Persons.	Ages.	Places of Abode.	Where recorded.
Hippocrates, physician	104	Island of Cos	Lynche on Health, chap. 3.
Democritus, philosopher	109	Abdera	Bacon's History, 1095.
Galen, physician	140	Pergamus	Voss. Inst. or lib. i.
Albuna Marc	150	Ethiopia	Hakewell's Appendix, lib. i.
Dumitur Raduly	140	Haromfzeek Transilvania	Died January 18, 1782, General Gazetteer, April 18:h.
Titus Fullonius	150	Bononia	Fulgofus, lib. viii.
Abraham Paiba	142	Charles-Town, South Carolina	General Gazetteer
L. Tertulla	137	Arminium	Fulgofus, lib. viii.
Lewis Cornaro	100	Venice	Bacon's History of Life, &c. p. 134.
Robert Blakeney, Esq.	114	Armagh, Ireland	General Gazetteer.
Margaret Scott	125	Dalkeith, Scotland	See Inscription on her Tomb in Dalkeith Church-yard.
W. Gullstone	140	Ireland	Fuller's Worthies.
J. Bright	105	Ludlow	Lynche on Health.
William Postell	120	France	Bacon's History, p. 134.
Jane Reeves	103	Essex	St. James's Chronicle, June 14, 1781.
W. Paulet, marquis of Winchester	106	Hampshire	Baker's Chronicle, p. 502.
John Wilton	116	Suffolk	General Gazetteer, Oct. 29, 1722.
Patrick Wian	115	Leibury, Northumberland	Piempius Fundammed, sect. 4, chap. 8.
M. Laurence	140	Orcades	Buchanan's History of Scotland.
Evan Williams	135	Caermarthen Workhouse	General Gazetteer, October 12, 1782.

If we ascend to the first ages of the world, and endeavour to investigate the causes of the longevity of the antediluvians, we shall find that different writers have stated them very variously. Some have imputed it to the sobriety of the antediluvians, and the simplicity of their manners; alleging that they abstained from flesh, and had none of those excitements to gluttony, which have been devised in subsequent times. Others have ascribed their longevity to the excellency of their fruits, and some peculiar virtues in the herbs and plants of those days. Others again have thought that the long lives of the inhabitants of the old world proceeded from the strength of their stamina, or first principles of their bodily constitutions; and this might be a concurrent, though not the sole and adequate cause of their longevity: for

Shem, who was born before the deluge, and had all the virtue of the antediluvian constitution, fell 300 years short of the age of his forefathers, because the greatest part of his life was passed after the flood. It has therefore been more rationally supposed, that the chief cause of their longevity was the salubrity of the antediluvian air; which, after the deluge, became corrupted and unwholesome. But how the flood should occasion this change in the air, it is not easy to comprehend; and the difficulty must remain unsolved, and we must content ourselves with ascribing it to the constitution of Providence, operating by unknown causes. The examples which are exhibited in the above tables are abundantly sufficient to prove, that longevity, in more modern times, does not depend so much as some have supposed, on

any particular climate, situation, or occupation in life. For we see that it often prevails in places, where all these are extremely dissimilar; and it would, moreover, be very difficult, in the histories of the several persons above mentioned, to find any circumstance common to them all, except perhaps that of being born of healthy parents, and of being inured to daily labour, temperance, and simplicity of diet. Among the inferior ranks of mankind, therefore, rather than amongst the sons of ease and luxury, shall we find the most numerous instances of longevity; even frequently, when other external circumstances seem extremely unfavourable: as in the case of the poor sexton at Peterborough, who, notwithstanding his unpromising occupation among dead bodies, lived long enough to bury two crowned heads, and to survive two complete generations. The livelihood of Henry Jenkins and old Parr is said to have consisted chiefly of the coarsest fare, as they depended on precarious alms. To which may be added, the remarkable instance of Agnes Milburne, who, after bringing forth a numerous offspring, and being obliged, through extreme indigence, to pass the latter part of her life in St. Luke's work-house, yet reached her hundredth and sixth year, in that fordid, unfriendly situation. The plain diet, and invigorating employments of a country life, are acknowledged, on all hands, to be highly conducive to health and longevity; while the luxury and refinements of large cities are allowed to be equally destructive to the human species: and this consideration alone, perhaps, more than counterbalances all the boasted privileges of superior elegance and civilization resulting from a city life.

From country villages, and not from crowded cities, have the preceding instances of longevity been chiefly supplied. For an illustration of this fact we refer to the article *BILLS OF MORTALITY*.

Attached as we are to life by the constitution of our nature, and desirous of protracting the short span, it seems to be no less our duty than our interest to examine minutely into the various means that have been considered as conducive to health and long life; and to discriminate between those that are collateral and accidental and such as are essential to this great end. In order to obtain sufficient data for reasoning justly and satisfactorily on this subject, it would be desirable to improve the mode of framing our bills of mortality; and with this view, it would be proper to add a particular account of the diet and regimen of every person, who dies at 80 years of age, or upwards; and to mention, whether his parents were healthy, long-lived people, &c. &c. All the circumstances, that are most essentially necessary to life, may be comprised under the six following heads: 1, air and climate; 2, meat and drink; 3, motion and rest; 4, the secretions and excretions; 5, sleep and watching; 6, affections of the mind. With regard to the first head, it may be observed that the common atmosphere may be more or less healthy, in proportion as it abounds with pure dephlogisticated gas, or oxygen; and as this is copiously supplied by the green leaves of all kinds of vegetables, we may hence in some measure account why instances of longevity are so much more frequent in the country than in great cities, where the atmosphere is contaminated with noxious animal effluvia, and with mephitic air or carbonic acid. As to climate, various observations conspire to prove that those regions which lie within the temperate zones are best adapted to promote long life. Hence perhaps we may be enabled to explain, why Italy has produced so many persons whose lives have been prolonged, and why islands in general are more salutary than continents. However, the Author of nature has wisely enabled the inhabitants of hot and cold

countries to endure great and surprising changes of temperature with impunity. See an account of experiments in a heated room, under the article *HEAT*. For the effects of *food and drink*, see these articles. It needs no proof, that alternate motion and rest, sleep and watching, are necessary conditions of health and longevity, and that they ought to be adapted to age, temperament, constitution, temperature of the climate, &c. Moreover, when the animal functions are duly performed, the secretions go on regularly; and the different evacuations so exactly correspond to the quantity of aliment taken in, in a given time, that the body is found to return daily to nearly the same weight. Besides, the due regulation of the passions, perhaps, contributes more to health and longevity than that of any other: the non-naturals. We may further add, that longevity is, in a great measure, hereditary: and that healthy, long-lived parents would commonly transmit the same to their children, if it were not for the frequent errors in the non-naturals, which so evidently tend to the abbreviation of human life. Nevertheless the duties and occupations of life will not indeed permit the generality of mankind to live by rule, and subject themselves to a precise regimen. Fortunately, this is not necessary: for the divine Architect has, with infinite wisdom, rendered the human frame so ductile, as to admit of a very considerable latitude of health; yet this has its bounds, which none can long transgress with impunity. For if old Parr, notwithstanding some excesses and irregularities, arrived at so astonishing an age, yet we have reason to suppose that these were far from being habitual; and may also conclude, that had it not been for these abuses, his life might have been still considerably protracted.

On the whole, though some few exceptions may occur to what has been already advanced, yet it will be found, in general, that all extremes are unfriendly to health and longevity. Excessive heat enervates the body; extreme cold renders it torpid; sloth and inactivity clog the necessary movements of the machine; incessant labour soon wears it out. On the other hand, a temperate climate, moderate exercise, pure country air, and strict temperance, together with a prudent regulation of the passions, will prove the most efficacious means of protracting life to its utmost limits. Now, if any of these require more peculiar attention than the rest, it is undoubtedly the last: for the social passions, like gentle gales, fan the brittle vessel calmly along the ocean of life; while, on the other hand, rough, turbulent ones dash it upon rocks and quicksands. Hence, perhaps, it may be explained why the cultivation of philosophy, music, and the fine arts, all which manifestly tend to humanize the soul, and to calm the rougher passions, are so highly conducive to longevity. And, finally, why there is no sure method of securing that habitual calmness and serenity of mind, which constitute true happiness, and which are, at the same time, so essential to health and long life, without virtue.

“Æquanimis sola, atque unica felicitas.”

LONGFORD, in *Geography*, a county of Ireland, in the north-western extremity of the province of Leinster. It has Roscommon on the west, Leitrim and Cavan on the north, and Westmeath on the east and south. Its length from north to south is 20 Irish miles (25 English), and its breadth from east to west 19 Irish, or 24 English miles. It contains 134,152 Irish acres (215,522 English), which are divided into 23 parishes, all of which, except one, are in the bishopric of Ardagh, united to Tuam. Though the northern angle consists of rugged mountains, and the south-western part is chiefly bog to a great extent, yet Longford may

may be reckoned populous; and it supplies large quantities of oats for distant markets. About Grasard is a fine tract of dry gravelly land, which is much used for fattening cattle. Lime-stone is here abundant; and it is surprising that, with this advantage, so little has been done towards reclaiming the bogs. In other parts of the county, the soil is in general a vegetable mould on the surface for three or more inches deep; under that, two inches thick of blue clay, which retains water; below this is yellow clay for two or three feet; and then lime-stone gravel. Oats is the grain principally raised. The linen manufacture has spread much through Longford. Spinning is universal, and there are now many weavers. The increase of the latter has been attributed to the liberal conduct of a gentleman, in giving 50*s*. to be lent to poor weavers, in sums of 5*l*. each, which were to be repaid by quarterly payments of 2*s*. 6*d*. The benefits attending such loans to the poor have been experienced in many places; and if care be taken in the management, it is a mode of assisting them which encourages their industry, and can never be called a *premium for idleness and extravagance*. There are also some bleach greens; and great quantities of yarn are sent to distant markets.

In the northern part of the county, near Lough Gawnagh, is a very rich iron ore in great abundance, not in thin beds, as that in the mountains near Lough Allen, and at Arigna in the adjoining county of Leitrim, but in solid rocks. It is of a dark red colour, and breaks into small shelving pieces. There are also indications of coal in the same neighbourhood. Longford is well watered. The Shannon forms its western boundary, and the Inny crosses it in the south. Lough Gawnagh, which covers several acres, is in the north; and some small rivers flow into the Shannon, on one of which, called the Camlin, the town of Longford is situated. It is intended that the Royal Canal should cross this county, and join the Shannon at Tarmonbury; a measure which cannot fail of leading to much improvement, if it should be ever completed. The towns are small. For Longford, the county town, see the next article; and for Granard and Lanesborough, those names in this work. Edgeworthstown, which was by some accident omitted in the proper place, may be noticed here. It is not, indeed, remarkable for its size, but it is remarkable for the residence of a family, which is distinguished for literary and scientific attainments. The name of Maria Edgeworth is too well known, and her talents as a pleasing and useful author too generally acknowledged, to need the praise of the writer of this article. The same may be said of her lively, ingenious, and patriotic father, Richard Lovell Edgeworth; and there is reason to expect that some of the younger branches of this family will add to a celebrity already very great. The writer has before him the reports of the bog commissioners, the eighth of which contains many proofs of the ingenuity of Mr. William Edgeworth. Mr. Edgeworth's house and the adjoining church contain many proofs of his mechanical skill.

The whole of the county of Longford was formerly called Annaly, and was a principality so late as the fifteenth century. It is now only represented in parliament by two knights of the shire; though it had, before the union, no less than four boroughs, which sent two members each. Beaufort, &c.

LONGFORD, a post-town of the county of Longford, Ireland, of which it is the shire town. It is situated on the river Camlin, and is of tolerable size, and pretty well built. It has a charter school for 60 boys. Longford is 59 miles W.N.W. from Dublin. Beaufort and Carlisle.

LONG-CHUAN, a city of China, of the first rank, in

the province of Se-tchuen, which contains a city of the third class under its jurisdiction, and is a place of great trade. N. lat. 32° 22'. E. long. 104° 18'.

LONG-HOU-KOEN, a town of China, in the province of Hon-quang; 52 miles S.S.W. of Pao.

LONGIANO, a town of Italy, in the department of the Rubicon; 12 miles N.W. of Rimini.

LONGIMETRY, the art of measuring lengths, both accessible, as roads, &c. and inaccessible, as arms of the sea, &c.

Longimetry is a part of trigonometry, and a dependant on geometry, in the same manner as altimetry, planimetry, stereometry, &c.

The art of longimetry see under the names of the instruments used in it, particularly THEODOLITE, CHAIN, DISTANCE, &c. See also MEASUREMENT.

LONGING in pregnant women, an inordinate desire for some particular kind of food, which, if denied, or not procured for them, was supposed to occasion wasting, and sometimes hysteric affections, in the women, and on the child, besides impairing its health, to impress the figure of the object longed for. This affection, which heretofore occasioned in families much anxiety and uneasiness, seems wearing away, just in proportion as the belief in witches, ghosts, and hobgoblins vanishes, or as reason and common sense procure an ascendancy over superstition and imposture. See that part of the article CONCEPTION, which treats of pica.

LONGINUS, DIONYSIUS, in *Biography*, celebrated for his treatise on the sublime, flourished in the third century, and is supposed by some to have been a native of Athens, by others of Syria. In his youth he travelled for improvement: he was known at Rome, Alexandria, and other cities distinguished for literature; and attended upon the lectures of all the eminent masters in eloquence and philosophy. Such was the extent of his erudition, that he was styled by his contemporaries "the living library." He appears to have taught philosophy at Athens, where Porphyry was one of his disciples. He was invited to the court of Palmyra, by its illustrious queen Zenobia, who took his instructions in the Greek language, and made use of his counsels on political occasions. This distinction was fatal to him: he was executed by order of the emperor Aurelian, who proved victorious over the troops of Zenobia, and took her prisoner. The queen, to save herself, imputed the resistance which she made to her counsellors, of whom Longinus was suspected to be the principal. The philosophy of Longinus supported him in the hour of his trial, and he submitted to his fate with resignation and cheerfulness. This event took place in the year 273. Gibbon observes on this circumstance, that the fame of Longinus will survive that of the queen who betrayed, or the tyrant who condemned him. Genius and learning were incapable of moving a fierce unlettered soldier, but they had served to elevate and harmonise the soul of Longinus. Without uttering a complaint, he calmly followed the executioner, pitying his unhappy mistress, and bestowing comfort on his afflicted friends. He was author of numerous writings. Dr. Pearce has collected the titles of twenty-five; but his treatise on the sublime, already referred to, is the only one remaining; and thus, as is well known to scholars, is in a mutilated and imperfect state. The best editions of it are those of Hudson, Pearce, and Toup. It has been translated into the English; but it is one of those works which scarcely admits of a translation. Speaking of this treatise, Mr. Smith, the translator, says, "It is one of those valuable

able remnants of antiquity, of which enough remains to engage our admiration, and excite an earnest regret for every particle of it that has perished. It resembles those mutilated statues, which are sometimes dug out of ruins: limbs are broken off, which it is not in the power of any living artist to replace, because the fine proportion and delicate finishing of the trunk excludes all hope of equalling such masterly performances." Smith's translation of the treatise on the Sublime. Moreri. Gibbon. Harwood.

LONGISSIMUS DORSI, in *Anatomy*, a muscle of the back. See **DORSI**.

LONGITUDE of the Earth, is sometimes used to denote its extent from east to west, according to the direction of the equator.

By which it stands contradistinguished from the *latitude of the earth*, which denotes its extent from one pole to the other.

LONGITUDE, in *Astronomy and Geography*. The longitude of any point of the heavens is the distance of its place, reduced to the ecliptic, from the vernal equinoctial point; that is, if a great circle pass through a star perpendicular to the ecliptic, the arc of the ecliptic intercepted between the intersection of this circle and the equinoctial point will be the longitude of the star.

The longitude of a place on the surface of the earth, is a portion of the equator intercepted between a meridian passing through the place, and another meridian which passes through some principal city or observatory assumed as a point of departure, from which the longitudes of other places are taken. The reason why longitude is so differently defined on the celestial and terrestrial globe, has been already explained under **LATITUDE**, to which article the reader is referred.

The subjects of astronomical investigation, arising from different definitions, are so intimately connected, that much of the present has been already anticipated. Under **RIGHT ASCENSION** we have shewn how, having given the longitude and latitude of a heavenly body, we deduce its right ascension and declination: and under **LATITUDE**, a rule has been given for computing the longitude and latitude from the observed right ascension and declination. But though we have shewn how the quantities are derived reciprocally one from the other, we have reserved for this place to explain how they are originally derived from elementary observations. We are therefore to suppose the case of a practical astronomer who should be desirous of making a catalogue of stars, and of determining their longitudes and latitudes independent of previous observation, except only such as are absolutely necessary for determining the quantity of precession, aberration, nutation, &c.

The observer is to be even supposed unacquainted with the latitude of his observatory, with the situation of the equinoctial points, and with the obliquity of the ecliptic. The principles of the method which we mean to explain were familiar to Flamsteed and the astronomers of that period, and are demonstrated in De Lalande's and Vince's *Astronomy*. But the late Dr. Maskelyne was the astronomer who improved and practised it with the greatest success in forming his catalogue of the thirty-six principal stars, and which would have been much more accurate than any ever known, had the instrument with which his observations were made been as perfect as those of later construction.

As no instrument now in use can give directly the longitude or latitude of a star, it is necessary, first of all, to determine the right ascensions and declinations of those stars of

which we mean to form a catalogue. The method of determining the declination has been already explained at great length. (See **DECLINATION**.) It is quite independent of the solar theory, and is derived by direct measurement of the meridian distance between the object and the pole. A mural circle, such as that now erecting at Greenwich, determines this distance, without any reference to the zenith; but with a quadrant, and with astronomical circles of the usual construction, it is either absolutely necessary, or at least convenient, to employ the zenith. And in this case we determine by one series of observations the distance of the zenith from the pole, and by another series the meridional distance of the zenith from each particular star. The first quantity, called the co-latitude of the place, being applied to the second, or zenith distance of the star, the sum is the polar distance. It is evident, that all this may be performed without any knowledge of the solar theory, or even without a single solar observation.

To determine the right ascensions of the stars, we might have assumed (had right ascension been otherwise defined) any great circle perpendicular to the equator, and passing through any given star, as α Aquilæ, exactly in the same manner as we assume an arbitrary meridian for the determination of terrestrial longitudes. But as astronomers have agreed to assume, as their first celestial meridian, that which passes through the vernal equinoctial point, the solar theory necessarily becomes involved with the subject of our investigation: we are, therefore, under the necessity of combining two distinct objects of enquiry. In the first place, it is necessary to determine exactly the relative situation of the stars with respect to each other and to the equator; and next, to place the ecliptic in its true position both with respect to the equator and to the fixed stars, and thus determine the situation of the equinoctial point. To have a clear idea of the whole of this process, we should observe that the two preliminary investigations are perfectly independent of each other; for the constellations (as we remarked above) might be truly placed on the celestial globe without any knowledge of the ecliptic, and the ecliptic, in like manner, might be placed making its proper angle with the equator; and the declination of the sun and its distance from the equinoctial point determined at any moment, by a series of solar observations conducted without any reference to the fixed stars, and even without any knowledge of their existence. It is by the combination of the results of these separate investigations that the intended object is accomplished. The practical method of conducting the whole of this operation is as follows:

In the first place, we assume the right ascension of any given star, as for example α Aquilæ, as near the truth as possible from prior determination, or we may consider it as entirely unknown, and call it zero. This is quite immaterial, but the former method is the most usual. The stars of the intended catalogue are then observed at the transit instrument for a series of years, with a view to determine their difference of right ascension from α Aquilæ and from each other. This investigation would be much more simple than it is, if the fixed stars always preserved the same relative position to each other, as the differences of right ascension would then remain the same. But this is not the case; the apparent position of each particular star is altered by the effects of aberration, precession, solar and lunar nutation. The phenomenon of *Aberration* has been already explained. That of *Precession* and *Nutation* will likewise be minutely described under their respective titles. At present, it is only necessary to observe, that the action of the sun and moon

LONGITUDE.

(considered as constant forces) produce by their action on the protuberant regions of the equator a slow periodical revolution of the earth's axis about the pole of the ecliptic. By this motion the equinoctial points are carried backward, and the position of the equator among the fixed stars changes at every instant. If the effect of this phenomenon was simply to cause a change in the position of the equinoctial points, the difference of right ascension of stars would not be affected by it; but it must be remembered, that the right ascension of a star is determined by a perpendicular drawn from the star to the equator; now, the equator changing its place, this perpendicular will change its place also; that is, the star will be constantly referred to a new point on the equator, and hence the right ascension will vary from two causes; one, the motion of the equinoctial point, or point of departure, which will equally affect every star; and the other from the change in the point of reference, by which, according to the definition, right ascension is determined. It is the latter only of these two causes that affects the difference of right ascensions.

The solar and lunar nutations of the axis of the earth arise from the unequal action of the sun and moon, by which the precession of the equinoxes is not described in the uniform and simple manner above mentioned. The reader will see under NUTATION, that the axis of the earth never points to its *mean* place; hence the *apparent* equator never coincides with the *mean* equator, or that circle which would be the equator, if these periodical nutations did not exist. These derangements of the equator, and the corresponding oscillations of the equinoctial points, affect both the longitudes and right ascensions of the stars, and likewise their declinations: their latitudes alone remain unchanged, for an oscillation in the axis of the earth produces no change in the ecliptic, which depends only on the path which the centre of the earth describes in space, and which is not affected by the causes we have above mentioned; but the ecliptic itself is deranged by the action of the neighbouring planets, for these cause the centre of the earth to take actually a new path in the heavens, though they are too distant to derange the parallelism of the earth's axis by any unequal action on the equatorial regions. The ecliptic, in consequence of this disturbance, changes its point of intersection with the equator, which circle remains, from this cause at least, unmoved, and consequently the declinations of the stars remain unchanged; but their longitudes are affected, not only because the equinoctial point is disturbed, from which longitudes are reckoned, but likewise because each star is referred to a new point on the ecliptic; hence arises a secular variation in longitude, peculiar to each star. The right ascensions are altered by the change of position in the equinoctial point, but this affects every star alike, and therefore produces no change in the difference of right ascension; in fact, the effect of this latter derangement enters as an element in the constant part of the precession common to all stars. The nature of all these changes, or equations, as they are technically called, has been, or will be, described under their appropriate terms, as *Aberration*, *Nutation*, *Ecliptic*, *Secular Variation*, &c. &c. which see respectively.

Now the nicety and delicacy of the modern method of reducing observations, consist in the exact determination of all these equations, and the due application of them to

each separate observation; so that instead of the apparent place, we make use of that in which we presume the object would have appeared, had none of these periodical oscillations existed. Agreeable to this conception of the subject, we may define some of the terms we have used above with greater precision than we have yet done. For instance, *mean right ascension* of a star, is the distance of the star's place corrected for aberration, reduced to the mean equator, from the mean vernal equinoctial point. *Apparent right ascension*, is the distance of the star's place reduced upon the apparent equator from the apparent equinoctial point.

Mean declination, is the distance of a star corrected for aberration from the mean equator. *Apparent declination*, is the apparent distance of the star from the apparent equator. The *mean equator*, is an imaginary great circle of the heavens, about which the apparent equator revolves without ever coinciding with it, in the manner already described. The *apparent equator*, is that great circle of the heavens which actually corresponds with the equinoctial line on the earth, whatever the position of the earth may be at the moment of observation.

If, with the mean right ascension, the mean declination, and the mean obliquity of the ecliptic, we compute the longitude of a star, that longitude will be its mean longitude, that is, its place referred to the ecliptic will be reckoned from the mean equinox.

If, with the apparent right ascension, the apparent declination, and the apparent obliquity, we compute the longitude, this will be reckoned from the apparent equinox. Sidereal time, (as used in these computations,) is that which has elapsed since the passage of the apparent equinoctial point over the meridian; for astronomers have not yet adopted a *mean sidereal time*, which might be defined the interval which elapses from the passage of the *mean equinoctial point*. This latter method would be more scientific than that now in use, and would be a similar improvement to the substitution of *mean solar time* for apparent solar time. Were this latter mode adopted, an alteration must be made in our present tables of nutation, and the equation of the equinoxes in right ascension, which now enters as common to all stars, would be omitted, as the same quantity would previously be applied to the error of the clock which is now applied to the star.

We have been led into this digression, and induced to dwell rather at length upon these preliminary considerations, because we do not, at this moment, recollect any author that has entered much on the subject, to whom we can refer.

The right ascension of α Aquilæ then, being assumed as near the truth as possible, the right ascensions of the other stars are to be inferred from it, by applying all the above equations, and likewise a correction for the error of the clock.

We subjoin an example of one day's computation, taken from the Greenwich Observations, 1809. The requisite tables for these reductions, for aberration, precession, nutation, have been given under DECLINATION (Tables II. and III.), and for applying the error of the clock to each star, the following table will be found very useful.

LONGITUDE.

† The signs are reversed in the reduction, because apparent A.R. is deduced from the assumed mean A.R. In the other stars the mean A.R. is deduced from the apparent.

In the above example the mean right ascension of α Aquila is assumed $19^h 41' 21''.75$ for January 1, 1807, and its apparent right ascension is deduced $19^h 41' 25''.58$ by applying the corrections of Tables II. and III. The first of these include the effect of precession, aberration, solar nutation, and proper motion peculiar to the star; the second gives the nutation, including the equation of the equinoctial point, so that the whole correction, when applied, gives the interval of fidereal time that should elapse between the passage of the star and that of the apparent equinoctial point;

this interval is $19^h 41' 25''.58$; and if the A.R. of the star be rightly assumed, it is the time which the clock should mark at the interval of the transit; but the clock marked only $19^h 40' 55''.74$. The difference is $29''.84$, which we call the error of the clock, and since its rate is -0.28 , we can, by means of the above table, calculate the error of the clock for every other star. For instance Capella, the decimal multiplier of which is 0.39 , which is to be multiplied by the daily rate, $-0.28 \times 0.39 = .109$, which added to $29''.84 = 29.95$, the reduction corresponding to

X 2 Capella.

LONGITUDE.

Capella, or the quantity to be added to the observed transit to obtain the apparent right ascension. The apparent right ascensions are next reduced to mean right ascensions for the beginning of the year by Tables II. and III. observing to apply the contrary signs to those for α Aquilæ, because now the mean place is to be deduced from the apparent, whereas we deduced the apparent place of α Aquilæ from the mean.

A series of observations and calculations, similar to the above, being continued for a great length of time, a catalogue is to be formed, which, supposing the instrument to be perfect, will be subject to no other error than that of the assumed right ascension of α Aquilæ, and with this error every right ascension will be affected.

The sun is likewise to be observed during the whole of this process, and its right ascension deduced as in the above example, and which will be subject to the same common error as subsists in the right ascensions of the stars.

While this series of observations is going on at the transit instrument, both the sun and stars are to be observed assiduously with the mural quadrant, or any other instrument destined to the determination of polar distances. We need not enter into the details of this process, as it has already been minutely described under DECLINATION, but shall proceed to consider the use we are to make of the result.

With respect to the stars, it is evident that by this double investigation we have determined their places accurately, both with respect to each other and to the equator, so that we might place them in their true positions on the celestial globe, provided no attention was required to be given to the situation of the ecliptic; and this would be the case, if the intersection of a meridian passing through α Aquilæ with the equator, had been assumed as an arbitrary point of departure in the same manner, as we assume a meridian passing through Greenwich or Paris on the terrestrial globe, as a standard to which terrestrial longitudes are referred. But the great circle to which celestial longitudes are referred, is required to pass through the equinoctial point: it is the exact position, therefore, of this point which we are in search of, and which is to be determined by the data we are now supposed to have collected.

The continued series of solar observations gives us the obliquity of the ecliptic, and the declination of the sun at the moment of observation, from which its right ascension may be easily deduced by the solution of a right-angled spherical triangle; but in making these computations, attention must be paid to the periodical oscillations of the equator,

and to the secular variation of the ecliptic itself; that is, the right ascensions must be calculated with the apparent obliquity, that they may be reckoned from the apparent or variable equinoctial point, in the same manner as those determined by the transit instrument, and with which they are now to be compared.

We have thus obtained a solar theory independent of the fixed stars, and the position of the fixed stars independent of the position of the ecliptic. It now only remains to combine these operations, and to place the ecliptic in its due position with respect to the fixed stars; and this is done in the following manner.

We begin by comparing the right ascensions of the sun determined by the transit instrument, with the right ascensions determined on the same day with the quadrant; and if they agree, it is a proof that the right ascension of α Aquilæ was rightly assumed; if they differ, as will most probably be the case, we must proceed and endeavour to ascertain both the quantity and the cause of the discordance.

If we consider one single insulated observation, the discordance may arise either from an erroneous assumption in the right ascension of α Aquilæ, or from some defect in our solar theory, or from some error in the observation from which the declination of the sun has been inferred. Now, though it would be impossible to assign the true cause of the discordance from one single comparison, yet the whole series will lead us to the truth, from this fortunate circumstance, that whatever error any defect in the solar observations produces in any one observation, the same defect will produce an equal error, but with the contrary sign, in an observation in which the sun is 180 degrees from its first position.

In selecting observations thus circumstanced, it must however be remembered, that although in theory we may determine the right ascension of the sun by trigonometrical calculation from any given declination, yet practically, no exactness can be expected, except when the change of declination is considerable, which only happens near the equinoxes. The exact limits in which the comparison may without impropriety be made, must depend on the accuracy of the instruments, and on the confidence of the observer in the correctness of his observations. In general, the period should not be extended to more than six or eight weeks on each side the equinox.

When the series of observations is complete, the results are to be arranged and compared as in the following table:

	A.R. of the Sun as deduced from Transit Observa- tions.			A.R. of the Sun as deduced from observed Declina- tions of the Sun.			Differ.	Sum.	Half sum, or Error.

Mean of 9, or of Catalogue								+	1.572

Let us examine one comparison, for the sake of example, in the above table; for instance, March 5th. It appears, that on that day the right ascension deduced from the quadrant observation differed $+ 8''.6$ from that observed at the transit. Now it is presumed, that a part of this error may be in the divisions of the quadrant, or in the assumed latitude, or in the obliquity of the ecliptic: we, therefore, compare this result with its corresponding one, Oct. 11th, when we find the error to be $- 5''.4$; hence we infer, that $3''.2$ only is to be attributed to the error of the transit observations, and that $1''.6$, or the half, is the real error of the catalogue common to every star; since, had that quantity been added, the positive and negative error would have been equal, and would have been therefore assigned altogether to the solar observations.

The beauty of Dr. Maskelyne's method, which we have thus endeavoured minutely to describe, consists in this, that it is not only extremely independent of those errors that are most likely to occur in a series of solar observations, but that it is capable of furnishing a clue to ascertain both the amount and cause of those errors. As this would lead us to an investigation rather foreign to the present subject, we shall not at present enter into these considerations.

Secular variation in the longitude of the fixed stars.

When the longitudes and latitudes of a number of stars are determined for a given period, these are computed for any distant period, by applying the precession of the equinoctial points, and likewise the secular variation for each particular star, and for which purpose a very accurate table has already been given under LATITUDE. This secular variation arises from the real change of position in the ecliptic itself; inasmuch as this affects the situation of the equinoctial point. The effect is common to all stars; and, therefore, this part of it only influences the quantity of the general precession; but because the position of the ecliptic is really changed among the constellations, each star becomes referred to a new point.

Though the trigonometrical investigation of the exact quantity of these changes is extremely complicated; yet the principle may be rendered sufficiently intelligible, by recollecting that a change in the position of the equator disturbing the equinoctial points, produces a change in the longitudes, right ascensions, and declinations, the latitudes only remaining the same. But a similar change in the ecliptic produces a change in the longitudes, latitudes, and right ascensions, whilst the declinations remain unaltered. In other words, the displacement of the equator affects every thing but the latitudes, and a displacement of the ecliptic every thing but the declinations.

On the methods of determining the positions of places on the surface of the earth, or their longitudes and latitudes.

The general nature of the problem having been already explained under LATITUDE; and several practical methods of determining the longitude having been described at great length under CHRONOMETER and DEGREE; we have now to explain a variety of astronomical processes which have been devised and brought to a great state of perfection within these last fifty years. Longitude, being only a relative term, to find the longitude of a place, is, in fact, to determine the difference of the longitude of two given places. And here we may observe rather a curious circumstance, which is, that though the problem is in its statement purely geographical, yet it can only be solved by the aid of astronomy, except upon the hypothetical supposition of a trigonometrical measurement extended over the whole surface of the earth, or at least over a great circle of its circumference. This being impossible, we must have recourse to the general principle we have so often had occasion to refer to in former astronomical articles. We suppose, at any given moment,

every point of the convex surface of the earth corresponds with some point in the concave surface of the heavens, called its zenith; and as the angular distance is the same on each, by measuring the angular distance of the celestial arc, which is always accessible, we obtain the corresponding and equal angular distance of the terrestrial arc, which otherwise would be practically impossible. Thus, for instance, one person at London, and another at Jamaica, have no means of knowing the exact proportion of the earth's circumference intercepted between them, except, indeed, by the inaccurate estimate of the length of a ship's track in sailing from one place to another; but if, by some artifice, each could ascertain, at any given moment, his zenith point in the heavens; then, as the angular distance of these zenith points could easily be measured, the corresponding terrestrial arc would immediately be determined. Now to this, or some very similar principle, may every process for finding the longitude be referred.

The investigation of the subject will be much simplified, if we suppose the equator, instead of being divided into 360 degrees, to be divided into 24 parts, and each part into 60, and subdivided again into 60. As each of these larger divisions passes under a celestial meridian in one hour of sidereal time, they are called hours to avoid circumlocution, though it is evident that a portion of a line cannot be an hour, or any part of time. But as the difference of measure will be expressed in the same terms as the difference of time, this mode of division is extremely useful, and shews us at once, that to determine the difference of longitude between two places, is equivalent to determining the difference of apparent time that exists between two places at any one given instant. The most obvious way of accomplishing this, is for two observers to watch some instantaneous phenomenon, and to mark the instant of apparent time at which each observed it. The instantaneous explosion of a mass of gunpowder is extremely well adapted for this purpose when the distance is not great, and has been successfully employed in the south of France, and in the north of Europe. It is evident that this method can only be employed for very limited distances: for places more remote, we are obliged to recur to the celestial phenomena, and we select those which have the greatest resemblance to the above, that is, which are the most instantaneous, and which appear the most nearly alike to two observers at the same actual instant of time. Unfortunately, there are none which unite these desirable combinations of circumstances. Eclipses of Jupiter's satellites, and of the moon, unite them in a very considerable degree, and accordingly have been employed to great advantage, particularly in the early state of geography, and in cases where the situation of the place was previously unknown.

An occultation of a fixed star is a very instantaneous phenomenon, but it is not seen at the identical instant of actual time by each observer; for, from the vicinity of the moon and its consequent parallax, it may to one observer appear to pass over a fixed star, when to another it may appear to pass entirely over or under it: hence, even in the case where an occultation is observed by two persons, the difference of longitude cannot be inferred by simply noting the difference of time at which the phenomenon happened to each observer. This defect, however, may be completely supplied by calculation, and therefore it is justly considered as one of the most accurate methods that can possibly be devised. We shall refer our readers to astronomical writers for examples of the various methods: our object at present is only to give a sketch of the different principles on which they are founded.

The longitude of a place on land may likewise be found with considerable exactness, by observing the passage of the

LONGITUDE.

moon over the meridian, and comparing it with the passage observed in some fixed observatory. A much greater accuracy will be obtained by this method, if several successive transits of the moon be taken at either place of observation, as then the motion of the moon in right ascension will be obtained without the aid of calculation: but it will be requisite to attend to the equation of second differences, and even then the irregularity of the moon's motion in 24 hours is so great, that a very sensible error may still remain uncorrected.

Several writers, in explaining this method, appear to have fallen into a misconception of the subject, by confounding together the retardation of the moon in 24 hours, with the real retardation observed between two successive transits, and which latter should evidently be used in calculating the proportional retardation corresponding to a given difference in longitude. Suppose, for instance, for the sake of rendering the subject as intelligible as possible, that the motions of the sun and moon were perfectly uniform and in the equator, and that they both passed the meridian of Greenwich at mean noon (which would, according to our supposition, be the same as apparent noon); suppose that the next day the moon passed the meridian of Greenwich at 1^h after noon. It is evident that the retardation would be one hour in twenty-five hours. On the opposite meridian the moon will pass at 0^h 30', at which instant it will be 12^h 30' mean time at Greenwich, or the half of 25 hours, this being the proportion of time answering to a retardation of 30'. In general, the attention of the calculator should be directed to finding the mean time at Greenwich, and to compare with this the mean time at the place of observation. The reader, who wishes to see more on this particular method, may consult a paper by Mr. Gavin Lowe in the 15th vol. of *Tilloch's Philosophical Magazine*.

Hitherto we have supposed two observations made by two observers, one at each place, whose difference of longitude with the other is to be determined; but it is evident that this is impracticable in many cases, and particularly in the one of the greatest importance, namely, when the object is to determine the longitude at sea. Here the mariner must be supplied with one calculated or supposed observation, instead of one really observed. The difficulty to be surmounted in this case is extremely great: of the immense number of methods more or less plausible that have been suggested, two only are in use at present, the one by the means of a *chronometer*, already explained at great length under that article; the other the lunar method, which has been gradually improved by the labour of succeeding astronomers, from the time it was first suggested, many years ago, to the present moment, when it is brought so near perfection, that no reasonable hope can be entertained of any very considerable improvement.

The early navigators had no means of estimating their longitude but by the computed run of the ship; and the dangers they incurred by this inaccurate method, were sufficient to convince every enlightened government, particularly of maritime states, of the importance of encouraging, to the utmost effort of human ingenuity, what could be directed to the improvement of this defective state of navigation.

The early speculations of astronomers were of but little practical utility to the navigation of those times. In the 16th century, eclipses of the moon were strongly recommended; but they happened very seldom, and were too inaccurately computed to be of any great use. Perhaps, now and then, the approximate longitude of an almost unknown country, where a mariner might accidentally be on shore, was computed by this method, but to determine the place of a ship it was perfectly inadequate.

Philip III. of Spain, in 1598, offered an hundred thousand crowns; and the states of Holland, at the beginning of

the seventeenth century, proposed a reward of thirty thousand florins to the person who should be fortunate enough to solve this difficult and important problem. In 1635, John Morin, professor of mathematics at Paris, proposed a method of resolving it to cardinal Richelieu, extremely similar to the lunar method now in use; but it was rejected as of no practical utility: and indeed, at that period, neither the lunar tables were of sufficient accuracy, nor the nautical instruments delicate enough to render the lunar method very promising. However, though the commissioners, who were appointed to examine this method, judged it insufficient, on account of the imperfection of the lunar tables, cardinal Mazarin, in 1645, procured for him a pension of 2000 livres.

Many attempts were founded on the theory of the magnetic variation; but none of these succeeded. It was the general opinion of astronomers, that the moon's motion was the most promising phenomenon to select; but long after the idea was first suggested, neither lunar tables nor instruments were sufficiently exact to render any method, founded on this theory, practically useful. Still, however, there was a rational hope that these difficulties might be overcome.

The first person who recommended the investigation of the longitude, from observing the distance between the moon and some star, is said to have been John Werner, of Nuremberg, who printed his annotations on the first book of Ptolemy's *Geography*, in 1514: Peter Apian, professor of mathematics at Ingolstadt, in 1524; Oronce Fine, of Brancan, about 1530; Gemma Frisius, at Antwerp, in 1530; Nonius or Pedro Nunez, in 1560; and Kepler, in 1630; all suggest and recommend the same method. In 1675, king Charles II. erected the observatory at Greenwich, and appointed Mr. Flamsteed his astronomical observer, with this express command, that he should apply himself with the utmost care and diligence to the rectifying the table of the motions of the heavens, and the places of the fixed stars, in order to find out the so much desired longitude at sea, for perfecting the art of navigation. To the fidelity and industry with which Mr. Flamsteed executed his commission, we are in a great measure indebted for that curious theory of the moon, which was afterwards formed by the immortal Newton. This incomparable philosopher made the best use which human sagacity could make of the observations with which he was furnished; but, as these were interrupted and imperfect, the difference of Sir Isaac's theory from the heavens would sometimes amount at least to five minutes. Dr. Halley employed much time on this subject; and a starry zodiac was published under his direction, containing all the stars to which the moon's appulse can be observed: but for want of proper instruments and correct tables, he could not proceed in making the necessary observations. In a paper on this subject he expresses his hope, that the instrument just invented by Mr. Hadley might be applied to taking angles at sea with the desired accuracy. (See *Phil. Trans.* N^o 421.) This great astronomer, and after him the abbé de la Caille, and others, have reckoned the best astronomical method of finding the longitude at sea, to be that wherein the distance of the moon from the sun, or from a star, is used; for the moon's daily mean motion being about thirteen degrees, her hourly mean motion is about half a degree, or one minute of a degree in two minutes of time; and so an error of one minute of a degree in position will produce an error of two minutes in time, or half a degree in longitude: and if by observation it is determined what part of her daily motion the moon has run through during the interval between a certain point of time under a known meridian, and the instant of time when the observations are made on her, under an unknown meridian, then her daily motion at that time will have, to the part thereof determined by observation,

tion, the same ratio which twenty-four hours has to the interval of time taken to describe that arc.

It was in the year 1714 that the parliament of Great Britain first began to consider this question as an object of national concern. And the loss of sir Cloudesly Shovel's fleet seems to have had some effect in drawing their attention to this subject; at least, if we may judge from the following document, copied from a manuscript in the Royal Observatory, signed by those well-known personages, William Whiston and Humphrey Ditton. It appears to have been one of the many petitions presented to the house of commons on this occasion.

Reasons for a Bill, proposing a Reward for the Discovery of the Longitude.

I. This bill is unexceptionable, because it is general, and not confined to any one project, person, or method; but gives equal hopes to all judicious proposers whatsoever.

II. Because in this bill no money is insisted on, before any method for the discovery of the longitude is, upon trial, actually found practicable and useful.

III. Because sir Isaac Newton's own paper, delivered into the Committee, gives hopes that the known method by the theory of the moon, which is hitherto not exact enough, may, upon due encouragement, in time be brought to perfection.

IV. Because the method now proposed is owned by all, to whom it has been communicated, to be certainly true in theory: it cannot, therefore, be fit to have it concealed, even though it were not yet known to be practicable; because, in that case, future improvements might still make it so.

V. Because its great use at land and in geography is indisputable, and was distinctly observed by sir Isaac Newton and Dr. Halley, upon the first proposal of this method to them: and we beg leave to say, that this use alone is so great and extensive, that if there were no other, it would highly deserve the encouragement of the public.

VI. Because another great use is also undoubted, viz. for all places in the narrow seas, and within about 100 miles of all shores and islands; that is, for all places where ships are in the greatest danger, as sir Isaac Newton owned to the committee; so that if this method extended no farther, yet it would highly deserve the public encouragement.

VII. Because there is little or no reason to doubt of its use at any place at sea, even where ships are allowed to be in the least danger; since, in the most doubtful case of all, sir Isaac Newton has, in his paper delivered to the committee, proposed an effectual remedy, as will be clearly understood, when the method itself is known to the world.

VIII. Because this method will save the nation great sums of money, which the want of it does now occasion, as will appear upon trial.

IX. Because the charges of it will be inconsiderable, in comparison of the advantage, as will also fully appear upon trial.

X. Because it will prevent the loss of abundance of ships and lives of men; as it would certainly have saved all sir Cloudesly Shovel's fleet, had it then been put in practice.

XI. Because it is easy to be understood and practised by ordinary seamen, without the necessity of any puzzling calculations in astronomy.

And we take leave to recommend the learned Savilian professor of geometry at Oxford, Dr. Halley, as the fittest person in the world for the trial, and practice, and improvement of this method; and do hereby declare, that we are willing that he go equal shares with us in the reward, if he please to undertake so useful a work, and the public please to make that reward equivalent to the great dignity and importance of the discovery.

June 10, 1714.

WILL. WHISTON.
HUMPHREY DITTON.

Accordingly an act was passed in this year, 1714, in the British parliament, appointing and empowering certain commissioners to make out a bill for a sum not exceeding 2000*l.* towards making necessary experiments; and also granting a reward to the person who should discover the longitude at sea, proportioned to the degree of accuracy that might be attained by such method; viz. a reward of 10,000*l.*, if it determines the same longitude to one degree of a great circle, or sixty geographical miles; 15,000*l.*, if it determines the same to two-thirds of that distance; and 20,000*l.*, if it determines it to half that distance. It is added, that one moiety or half part of such rewards or sum shall be due and paid when the said commissioners, or the major part of them, do agree that any such method extends to the security of ships, within eighty geographical miles from the shores, which are places of the greatest danger; and the other moiety or half part, when a ship, by the appointment of the said commissioners, or the major part of them, shall thereby actually sail over the ocean, from Great Britain to any such port in the West Indies as those commissioners, or the major part of them, shall chuse or nominate for the experiment, without losing her longitude beyond the limits above mentioned. 12 Ann. cap. 15. See also stat. 14 Geo. II. cap. 39. 26 Geo. II. cap. 25. By stat. 14 Geo. III. all former acts concerning the longitude at sea are repealed, except so much of them as relates to the appointment and authority of the commissioners thereby constituted, and also such clauses as relate to the constructing, printing, publishing, &c. of nautical almanacs, and other useful tables; and it is enacted, that any person, who shall discover any method for finding the longitude by means of a time-keeper, shall be entitled to the proposed reward, as we have already stated under the article CHRONOMETER; which see.

From the very considerable improvements made by sir Isaac Newton in the theory of the moon, and more lately by M. Euler, and others on his principles, Mr. Tobias Mayer, professor of Gottingen, was enabled to calculate lunar tables more correct than any that were before published, and he has succeeded so far as to give the moon's place within one minute of the truth. This has been proved by a comparison of the tables with the observations made at the Greenwich observatory by the late Dr. Bradley, and by Dr. Maskelyne. These tables, for which the widow of Mr. Mayer was rewarded by the British parliament, were published in 1770, by Dr. Maskelyne, by order of the commissioners of longitude. Dr. Maskelyne, in his voyage to St. Helena, in 1761, made use of these tables, and found them to answer for the discovery of the longitude, within a degree; and in order to facilitate the general use of them, he proposed a nautical ephemeris, the scheme of which was adopted by the commissioners of longitude, and first executed in the year 1767; and the publication has been regularly continued ever since. But as the rules that were given in the appendix to one of those publications, for correcting the effects of refraction and parallax, were deemed too difficult for general use, they were reduced to tables: so that by the help of the ephemeris, these tables, and others that are provided, the calculations relating to the longitude, which could not be performed by the most expert mathematician in less than four hours, may now be completed with greater ease and accuracy in half an hour. Dr. Maskelyne observed, that the error of Mr. Mayer's last lunar tables scarce ever exceeds 1' at the most, and seldom amounts to 20"; and, therefore, the uncertainty hence arising in the determination of the longitude, can scarcely exceed half a degree, and generally will not exceed ten miles.

We observe, in general, with regard to the historical part of this article, that when Hadley had invented the quadrant, or octant, which still bears his name, and when Mayer had brought

LONGITUDE.

brought the lunar tables to an unexpected degree of precision, astronomers of every nation began to conceive the most rational hopes, that, by gradual improvement, this method would at last be found to equal the most sanguine expectation.

Those who first attempted to practise it had to struggle with great difficulties; and the requisite calculations were so formidable, that none but astronomers, or at least very able calculators, could possibly attempt them.

The late astronomer royal, Dr. Maskelyne, practised this method with the greatest success; and it is to him this country is indebted for some of the greatest improvements that have been made. It was he who first proposed and superintended the construction of the Nautical Almanac, which relieves the calculator from all the very laborious part of the process; and the remaining part of the computation has been so simplified by successive improvements, both in the formulæ and construction of tables, that, at present, the necessary observations may be both made and computed by any mariner, who has received a tolerably good nautical education.

As the practical methods of making and computing a lunar observation are given at great length in every nautical book, we shall confine ourselves to explaining the general nature and object of the problem, and refer the reader to professed treatises on navigation for farther information. In Mackay's treatise on the Longitude, the reader will find some excellent methods of solving both this and a variety of other nautical problems, accompanied by very useful tables. Mendoza's tables contain his own valuable method of computing a lunar observation, beside general tables for every nautical purpose. The requisite tables are well known, and are in the hands of every navigator.

Explanation of the principles of the method by which the longitude is found at sea, by observing the distance of the moon from the sun, or a given fixed star.

The requisite data for determining the longitude at sea, by the lunar method, are the apparent distance of the centre of the moon from the centre of the sun or star, and the apparent altitude of the centres of each at the moment of observation. Hence three observers are usually employed: one observes the distance between the sun and moon, one the altitude of the sun, and the other the altitude of the moon. When this cannot be done, the place of the other two may be supplied by computation.

By means of lunar tables, the exact distance of the moon from the sun or star is computed for every three hours, for the meridian of Greenwich. We are not, however, to suppose that these distances are such as the moon and sun would appear to have at Greenwich; but such as they would appear to an observer at the centre of the earth. It is for Greenwich time only that they are computed; a circumstance not sufficiently insisted upon by elementary writers on this subject. From these tables (of the Nautical Almanac) it is easy to infer the distance for any intermediate interval: a simple proportion will be sufficient for this purpose. We may therefore consider ourselves as in possession of an instantaneous phenomenon, answering to every instant of time at Greenwich; since the distance of the sun and the moon are never the same for two successive instants of time. Now if we consider the converse of this proposition, it is equally evident, that if we have given the distance of the moon from the sun, as seen from the centre of the earth; we can, by the same tables, infer the exact time at Greenwich corresponding to this distance. Now the object of a lunar observation is to determine this distance at a given moment of actual time, to ascertain the apparent time at this moment for the meridian of the observer, and to compare it with the moment of Greenwich time, which is to be inferred from the given distance. Now the difficulty of the process arises

from this circumstance, that since, to an observer on the surface of the earth, the moon appears always depressed by the effect of parallax, and the sun elevated by the effect of refraction, the angular distance observed with a sextant, or any other instrument, is not the same as the distance seen from the centre of the earth, and for which alone the nautical tables are calculated. Hence a spherical computation becomes necessary. Two cases of oblique spherical triangles must be computed, before the observed distance can be corrected, and the true distance ascertained.

The general nature of the problem may be more easily understood by a reference to the figure (*Plate XVII. Astronomy, fig. 1.*), which is a projection of the sphere on the plane of the meridian: \odot is the observed or apparent distance of the sun and moon; $Z \odot$ is the zenith distance of the moon; $Z \odot$ that of the sun; m is the true place of the moon, when corrected for refraction and parallax, which together tend to apparently depress it; s is the true place of the sun, when corrected by refraction and parallax, which together tend apparently to elevate it: for the moon's parallax is always greater than the refraction, the sun's always less. For a star, the simple correction for refraction is all that is required.

We have now, therefore, given three sides in the triangle $Z \odot \odot$, and two sides (*viz.* Zm , Zs) in the triangle Zms . In the triangle $Z \odot \odot$, the angle Z may be found from the three given sides; and then with Zm , Zs , and the included angle Z found above, ms , or the true distance, may be obtained.

To shorten the solution of this problem, and to reduce it within the compass of a mariner's ordinary powers of computation, has been an object with the first geometricians in Europe. It would lead us much beyond our limits to give a history of the numerous solutions that have been proposed. The French mathematicians, probably not having a great facility of constructing tables, have directed their attention chiefly to such methods as require only the common tables of logarithms. In our own country, where the board of longitude is always ready to publish any useful tables that may be approved, those methods and formulæ have been in general preferred, which admitted of the shortest solution by means of tables. In this respect, a progressive series of improvement has taken place since the first introduction of the method; and a skilful mariner will now compute the true distance from the apparent in five minutes, when formerly as many hours were required.

Besides the methods founded on a direct trigonometrical solution, there are many (such as Lyon's and Dr. Maskelyne's) which are founded on rather a different principle. The small triangle $\odot mm'$ is computed as if a plane one, $\odot m'$ being the effect of the total depression of the moon in changing the distance: a similar triangle is formed for computing the effect of refraction for the sun or star. Various formulæ have been deduced from each of these principles, for the investigation of which the reader may consult Cagnole's Trigonometry, and various volumes in the *Connaissance des Temps*. A very clear and scientific investigation of all these methods was given by Mr. Mendoza, in the *Philosophical Transactions* for 1797.

To enable the reader to judge of some of the most approved of these, we shall give a solution of the same problem by a variety of different ways.

Given Apparent altitude \odot	-	32° 34' 47"
Apparent altitude \odot	-	39 3 4
Apparent distance $\odot \odot$	-	86 10 19
Horizontal parallax	-	0 58 28

Required the true distance.

The first example we shall give is the method of Borda, which is in general use among the more skilful of the French navigators.

LONGITUDE.

The formula is as follows:

$$\text{Let } \frac{1}{\cos. \frac{1}{2} (A + H)} \sqrt{\frac{\cos. \frac{1}{2} (d + a + b) \cos. \frac{1}{2} (d - (a + b)) \cos. A \cos. H}{\cos. a \cos. b}} = \sin. N$$

Then $\sin. \frac{1}{2} D = \cos. \frac{1}{2} (A + H) \cos. N$.

In which A = true altitude of \odot

a = apparent altitude of \odot

H = true altitude of \odot

b = apparent altitude of \odot

d = observed or apparent distance $\odot \odot$

D = true distance required.

Example I.—Borda's Method.

Apparent distance $\odot \odot$	-	86° 10' 19"		
Apparent altitude \odot	-	32 34 47	Com. ar. log. cof.	0.0743564

			True distance	85 42 58

When Callet's Logarithms are used, much labour may be avoided, by taking the nearest multiple to 10" in the apparent distance and making an equal alteration in the result. In the above example, the distance for calculation might be 86° 10' 20"; and then one second should be deducted from the result, which would have been 85° 42' 59".

Example II.—According to the method given by Dr. Maskelyne in the Preface to Taylor's Logarithms. Let the apparent altitude of the moon's centre be 39° 3' 4", that of the sun 32° 34' 47"; their apparent distance 86° 10' 19", and the moon's horizontal parallax 58' 28". Required the true distance of the sun and moon.

 $10'$
 $3'$
 $20^{\circ} 22'$

Aux. arg.

This method is not only extremely short and easy, but is exempt from any possible confusion of signs, all the corrections being additive. It is really so perfect, that it should supersede every other now in use.

Mr. Mendoza's formula is

$$\sin. \text{ver. } D + 4 = \left\{ \begin{array}{l} \sin. \text{ver. } (A + H) + \sin. \text{ver. } (d + M) + \sin. \text{ver. } (d \smile M) = P \\ + \sin. \text{ver. } (a + b + M) + \sin. \text{ver. } ((a + b) \smile M) = Q \end{array} \right.$$

$$2 \text{ cof. } M \text{ being taken} = \frac{\text{of. } A \text{ cof. } H}{\text{cof. } a \text{ cof. } b}$$

The operation performed by his tables is as follows :

Observed altitude ☉	-	-	-	b	
Ditto ☾	-	-	-	a	
Sum	-	-	-	$a + b$	
With b in Table VI. take	-	-	-	$60' - r + p$	$r = \text{refract. } p = \text{parallax}$
— d — take M and	-	-	-	$r - p$	
The sum	-	-	-	$A + H$	

With $(a + b)$ and M in Table XI.	take Number	$I = Q$
— $(A + H)$ — XI.	-	$II = \sin. \text{ver. } (180^{\circ} - (A + H) - 59')$
— d and M — XI.	-	$III = \sin. \text{ver. } (d + M) + \sin. \text{ver. } (d \smile M)$

The sum or number $IV = \sin. \text{ver. } D + 4 = I + II + III = IV$

Example V.

By the method proposed in the Appendix of the requisite Tables published by Dr. Maskelyne a very short time before his death. A very good table of verified lines accompanies it.

The apparent distance of the moon's centre from the sun's centre being $86^{\circ} 10' 19''$; the apparent altitude of the sun's centre $32^{\circ} 34' 47''$; the apparent altitude of the moon's centre $39^{\circ} 3' 4''$; and the moon's horizontal parallax $58' 28''$; required the distance of their centres.

☾'s horizontal parallax	$0^{\circ} 58' 28''$		
☉'s apparent altitude	$32^{\circ} 34' 47''$	$- 1' 22''$	$45' 36''$ whole correction.

Apparent distance ☉ ☽	108 42	III	{ 16566 16	
Referred seconds -	108 27 42 3	IV	{ 16673 477	
True distance -	108 27 45		196	
				Auxiliary argument.
				24 42
				9
				3
				24 54

The above example by direct calculation from M. Mendoza's formulæ, would stand thus :

Apparent distance	-	108° 42' 3"	Horizontal parallax	-	-	55' 19"
Apparent altitude ☉	-	6 27 30 = b	Apparent altitude ☽	-	-	54 11 57 a
Correction p - r	-	7 46	Correction p - r	-	-	+ 31 41
		<u>6 19 44 = H</u>				<u>54 53 38 A</u>

a + b

LONGITUDE.

$$a + b = 60^{\circ} 39' 27''$$

$$M = 60 \quad 24 \quad 54$$

$$\begin{array}{rclcl} (a + b) + M & = & 121 \quad 4 \quad 21 & \text{N.V.S.} & 1.516122 \\ (a + b) - M & = & 0 \quad 14 \quad 33 & \text{N.V.S.} & 0.000010 \\ A + H & = & 61 \quad 3 \quad 22 & \text{N.S.V.S.} & 1.483953 \\ d + M & = & 169 \quad 6 \quad 57 & \text{N.V.S.} & 1.982011 \\ d - M & = & 48 \quad 17 \quad 9 & \text{N.V.S.} & 0.334585 \end{array} \left. \begin{array}{l} \\ \\ \\ \end{array} \right\} \begin{array}{l} 1.516132 = N^{\circ} \text{ I.} \\ 1.483953 = N^{\circ} \text{ II.} \\ 1.316596 = N^{\circ} \text{ III.} \end{array}$$

$$5.316681$$

$$4$$

$$\text{True Distance} \quad 108 \quad 27 \quad 45$$

$$1.316681$$

If the proportional part for seconds of apparent altitudes be taken from the tables, the analogy with the above will be apparent.

☉'s Apparent altitude	-	-	6	27	30"	Apparent distance ☉ ♃	-	-	108°	42'	3"
♃'s Apparent altitude	-	-	54	11	27	Horizontal parallax ,	-	-	0	55	19
Sum of apparent altitudes	-	-	60	39	27	I.	-	15725	} = 16132		
Correction for ☉ Table VII.	-	-	52	14		Proportional part	224				
Ditto for ♃ Table VII.	-	-	31	29		Proportional part	113				
Proportional part	-	-			12	II. {	-	83792	} = 83954		
Sum of corrected altitudes	-	-	62	3	22		-	162			
Apparent distance	-	-	108	42	3	III. {	-	16566	} = 16582		
							-	16			
Reserved seconds	-	-	108	27	42			16668	} = 16668		
					3			16477			
True distance	-	-	108	27	45			191			

The following approximate method, by means of the small triangles, (*Plate XVII. Astronomy, fig. 1.*) is computed without any auxiliary tables, by this formula.

$$\text{Correction } Y = q \text{ cof. } S - p \text{ cof. } L.$$

$$\text{And fin. } \frac{1}{2} L = \sqrt{\left(\frac{\text{cof. } \frac{1}{2} (D + a + b) \text{ fin. } \frac{1}{2} (D + a - b)}{\text{cof. } a \text{ fin. } D} \right)}$$

$$D = \text{apparent distance.}$$

$$a = \text{apparent altitude } \text{♃}.$$

$$\text{fin. } \frac{1}{2} S = \sqrt{\left(\frac{\text{cof. } \frac{1}{2} (D + a + b) \text{ fin. } \frac{1}{2} (D + b - a)}{\text{cof. } b \text{ fin. } D} \right)}$$

$$b = \text{apparent altitude } \text{☉}.$$

Let the apparent distance ☉ ♃ be $108^{\circ} 42' 3''$; apparent altitude ☉ $6^{\circ} 27' 30''$; apparent altitude ♃ $54^{\circ} 12'$; refraction — parallax $7' 43''$ for the ☉; and parallax — refraction $31' 42''$ for the ♃. Required the true distance.

Computation of the angle S at the centre of the Sun.

Computation of the angle L at the centre of the Moon.

$$\begin{array}{rcl} \text{App. dist. } \text{☉ } \text{♃} & 108^{\circ} 42' 0'' & \text{com. ar. log. fin. } 0.02355 \\ \text{App. alt. } \text{☉} & 6 \quad 27 \quad 30 & \text{com. ar. log. cof. } 0.00177 \\ \text{App. alt. } \text{♃} & 54 \quad 12 \quad 0 & - \end{array}$$

$$\begin{array}{rcl} & & 0.02355 \\ & & - \\ & & \text{com. ar. log. cof. } 0.23287 \end{array}$$

$$\begin{array}{rcl} \text{Sum} & 169 \quad 21 \quad 30 & \\ \text{Half sum} & 84 \quad 40 \quad 50 & \log \text{ cof. } 8.96712 \\ \text{Half sum} - \text{app. alt. } \text{♃} & 30 \quad 28 \quad 50 & \log \text{ fin. } 9.70522 \end{array}$$

$$\begin{array}{rcl} \text{Half sum} - \text{app. alt. } \text{☉} & 78^{\circ} 13' 10'' & \log \text{ fin. } 9.99075 \end{array}$$

$$\begin{array}{rcl} \text{Sum} & 18.69866 & \\ \text{Half sum} & 9.34933 & \end{array}$$

$$\begin{array}{rcl} \text{Sum} & 19.21429 & \\ \text{Half sum} & 9.60715 & \end{array}$$

$$\begin{array}{rcl} \text{which is log. fin. } \frac{1}{2} S & = 12 \quad 55' \quad 0'' & \\ \text{therefore } S & = 25 \quad 50 \quad 0 & \log \text{ cof. } 9.95430 \\ \text{Ref. — par. of } \text{☉} & = 463'' & \log. \quad 2.66558 \end{array}$$

$$\text{which is log. fin. } \frac{1}{2} L = 23^{\circ} 52' 25''$$

$$\begin{array}{rcl} \text{therefore } L & = 47 \quad 44 \quad 50 & \log \text{ cof. } 9.82763 \\ \text{Par. — refr. } \text{♃} & = 1902'' & \log. \quad 3.27921 \end{array}$$

$$\text{Carried forward Sum } 2.61988$$

$$\text{Carried forward Sum } 3.10684$$

LONGITUDE.

Brought forward 3.10684 Log. of p cof. $L = 1279'' = 21' 19'' -$
 Brought forward 2.61988 log. of q cof. $S - = 417 = 6 57 +$

Difference 14 22 $- = Y$
 Or total correction required.

Apparent distance $\odot D - - 108^{\circ} 42' 3''$
 Excess of this distance above the reduced 14 22

Distance reduced $\odot D - - 108 27 41$

The only advantage of this method is that it requires only a table of logarithms to five places.

The true distance being thus determined, it only remains to find the corresponding time at Greenwich, and to compare it with that found on board the ship. This latter may be found from the altitude of the sun at the moment of observation: but it may happen that the sun is not favourably situated at this moment, in which case, and indeed generally, the time had better be deduced from solar observations made expressly for the purpose; and which, with a good chronometer, may even be made two or three days before or after the observations for the longitude, if cloudy weather should prevent others being made at a shorter interval; only it must be remembered, that the deduced longitude will correspond with that of the place where the error of the chronometer is determined, and not for the place of observation.

The instruments used for these lunar observations are sextants and reflecting circles. Under CIRCLE we have already described the reflecting circle of Mr. Troughton's construction, which we conceive to be vastly superior to any sextant for obtaining with accuracy the angle subtended by the moon and star. As each observation has three readings, two observations (one on each side) of zero, give six results. This instrument, in the hands of a careful observer, will not give a greater error than $20''$, or about ten geographical miles at the equator. The error of the lunar tables may amount to about as much more, and an error in the altitudes and other data, about the same quantity. Should all these conspire to produce a total error in the same direction, this total error would amount to $60''$, or 30 miles. We trust, there-

fore, that the advantage and importance of this method will every day be more and more appreciated; and that the time will come when no naval officer or mariner of tolerable education will be found ignorant of it. With Mendoza's tables, a circle of the above description, and a good chronometer, the longitude may always be determined within thirty miles, and generally within less.

Some persons still prefer sextants, from an opinion that they derive some advantage from length of radius; but they are subject to errors which have no tendency to correct each other, and should only be used for the altitudes, and the circle to be taken in preference for the observations of the distance. When circumstances do not admit of three observers, the altitudes of the sun and moon may be computed, and we are disposed to think that this would always be the more preferable method, where the observer is sufficiently skilful to make the additional computation without fear of mistakes. The altitudes found in this case by computing the horary angles are the true altitudes, and must be corrected by applying the refraction and parallax *inversely*, but for doing this accurately, tables should be computed for reducing *true distances* to *apparent*. However, a little attention to this circumstance will render the whole operation sufficiently easy, and if the computations are well made, the accuracy of this method will probably exceed that of direct observation. For the method of making these computations, see Mendoza's Tables, Requisite Tables, &c. Mackay's Longitude, &c. &c.

LONGITUDE.

A TABLE containing the Latitudes of Places, with their Longitudes from the Meridian of the Royal Observatory at Greenwich; also the Time of High Water at the Full and Change of the Moon, at those Places where it is known.

LONGITUDE.

A CATALOGUE of the Longitudes and Latitudes of Six Hundred fixed Stars, with the Angle of Position of each Star, adapted to the Beginning of 1800.

N. B. This Catalogue is taken from the Connoissance des Temps P. An. XII. and was calculated from the French Annual Catalogue, by M. Chabrol.

Names of Stars.			Longitude.				Latitude.				Angle of Polition.			Annual Variations.

LONGITUDE, *Angle of*. See **ANGLE**.

LONGITUDE, *Argument of*. See **ARGUMENT**.

LONGITUDE, *Circles of*. See **CIRCLE**.

LONGITUDE, *Degrees of*. See **DEGREE**.

LONGITUDE, *Parallax of*. See **PARALLAX**.

LONGITUDE, *Refraction of*. See **REFRACTION**.

LONGITUDE of *Motion*, is used by Dr. Wallis for the measure of motion, estimated according to the line of direction; on which principle, longitude of motion is the distance, or length, which the centre of any moving body runs through, as it moves on in a right line.

The same author calls the measure of any motion, estimated according to the line of direction of the vis motrix, the *altitude* of it.

Bellini also uses the terms longitude and altitude in the same sense, in many places of his writings, which an ordinary reader finds hard to understand, for want of this interpretation. By *altitude* also in his 10th proposition De Febribus, he makes the thickness of the viscid matter in the blood-vessels; or the greatest length a viscid particle is extended into, from the side of a canal to its axis.

LONGITUDINALIS SINUS, a name given to two of the venous cavities of the dura mater; they are distinguished by the epithets superior and inferior. See **VEIN**.

LONGJUMEAU, in *Geography*, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Corbeil; 10 miles S. of Paris. The place contains 1434, and the canton 13,650 inhabitants, on a territory of $47\frac{1}{2}$ kilometres, in 25 communes.

LONGNESS POINT, a cape on the S. coast of the Isle of Man; 10 miles S.S.W. of Douglas.

LONGOBARDO, a town of Naples, in Calabria Citra; 10 miles S.W. of Cosenza.

LONGOBUCO, a town of Naples, in Calabria Citra; 14 miles S. of Rosano.

LONGOMONTANUS, CHRISTIAN, in *Biography*, an eminent Danish astronomer, son of a labouring peasant, was born at Longomontium, a village in Jutland, whence he took his surname, in the year 1562. His father was anxious to afford him a good education, but dying before he was eight years of age, he was committed to the care of an uncle, who finding the expence devolved on him by the lad more than he could bear, advised him to return to his mother, and to earn his living by the sweat of his brow. The youth, who shewed a great inclination for learning, was mortified at the proposal, but not wholly disheartened; he returned to the labours of an agricultural life, and at the same time improved every leisure moment in acquiring useful knowledge. At length he was driven, by the jealousies of his brothers, to quit his home, and he sought an asylum at Wiburg, where there was a college. Here he spent eleven years, and made great progress in the mathematical sciences, though he was at the same time obliged to support himself by his industry. From Wiburg he went to Copenhagen, and became an assistant to Tycho Brahe, with whom he continued eight years. During this period, he afforded Tycho much assistance in observing the heavens and in his calculations, and was so accurate and laborious, and at the same time so skillful, that he became the confidential friend of that great man. At length he returned to his native country, with the highest recommendations from Tycho, who furnished him with money to defray the expences of so long a journey. He travelled through Poland, in order that he might have a sight of the place which witnessed Copernicus's astronomical labours. At Copenhagen he met with a noble-hearted patron in the chancellor Christian Friis, who afforded him an honourable employment in his family. In 1605 he was nomi-

nated to a professorship of mathematics in the university of Copenhagen, a situation which had ever been the object of his highest ambition, and for which his genius and talents peculiarly qualified him; and he discharged the duties of it with the greatest ability, and highest reputation, till his death, which took place in 1647, when he was about the age of eighty-five. He was author of many valuable works, of which the most distinguished is entitled "*Astronomia Danica*," which contains all the great discoveries of Regiomontanus, Purbach, and Tycho Brahe. The titles of his other works are given in Hutton's Dictionary. Obscure as his native place and father were, he contrived to immortalize both, by taking his name from the village, and in the title-page to some of his works, calling himself Severini filius, his father's name being Severin, or Severinus.

LONGOTOMA, in *Geography*, a town of Chili, on the N. side of a river of the same name, that runs into the Pacific ocean, S. lat. $31^{\circ} 30'$. The town is distant 84 miles S. from Coquimbo.

LONGSPIEL, a very ancient musical instrument, found by sir Joseph Banks and Dr. Solander in Iceland, when they visited that country in 1773. This instrument, of a long and narrow form, and strung with four strings of copper, is extremely rude and clumsy. One of the four strings is used as a drone, the rest are played with a bow. Pieces of wood are placed at different distances on the finger-board, to serve as frets. It seems, indeed, to have been the primitive idea of a fiddle, and is a proof that the use of the bow, that wonderful engine, which the ancients, with all their ingenuity and musical refinements, had never been able to discover, and which has been rendered so miraculous, was known by the Scalds in Iceland, at least as early as in any other part of Europe. See **SCALDS**.

LONG-TAN, in *Geography*, a town of Corea; 42 miles S. of Hetfin.

LONG-TCHANG CHING, a town of China, in Chang-tong; 15 miles E. of Tei-nan.

LONG-TCHIAN, a mountain of Thibet. N. lat. $27^{\circ} 48'$. E. long. $86^{\circ} 39'$.

LONG-TCHUEN, a town of Corea; 55 miles W.N.W. of Han-tcheou.

LONGTOWN, a market town in the parish of Arthuret and ward of Eskdale, in the county of Cumberland, England, is situated on the borders of Scotland, near the conflux of the rivers Esk and Liddel, 9 miles distant from Carlisle, and 313 N. from London. The houses are mostly built in the modern style, and some of the streets are regular and spacious. At the north-end of the town is a stone bridge over the Esk. Longtown was returned to parliament, in the year 1801, as containing 176 houses, inhabited by 1335 persons, of whom 648 were stated to be employed in trades and manufactures. A market is held on Thursdays; and two fairs annually. Longtown stands in the midst of the estate of sir James Graham, of Netherby, whose predecessor, Dr. Robert Graham, may be considered as having been the principal cause of the prosperous state of this part of Cumberland. Under his patronage Longtown became populous; and by constructing the little harbour at Sarkfoot, he furnished the people with an easy mode of exporting their produce and supplying themselves with necessities.

Netherby, the seat of sir James Graham, is much celebrated in the topographical annals of this county, from the vast improvements that were made here during the latter part of the last century: nor is it less interesting to the antiquary from the assemblage of Roman remains that have been here preserved; and from its having been a Roman

station. The mansion, which stands on an eminence near the river Elk, was erected by the late Dr. Graham, about the year 1760, but has been much improved by the present proprietor. It is elegantly fitted up; and contains a valuable collection of ancient and modern medals, and a library furnished with a selection of classic and other valuable authors. The gardens and pleasure grounds are disposed with much taste and judgment. Beauties of England and Wales, vol. iii.

LONGUEP, a town of France, in the department of the Maine and Loire, and chief place of a canton, in the district of Baugé; 16 miles S. of Baugé. The place contains 5003, and the canton 13,935 inhabitants, on a territory of 280 kilometres, in 17 communes.

LONGUE, a small island in the Indian sea; 15 miles N. of Mauritius.

LONGUEUIL, CHRISTOPHER DE, in *Biography*, born at Mehlis in 1488, was natural son of Antony de Longueuil, bishop of Leon, and chancellor of Anne, queen of Bretagne. He was taken to Paris while he was very young, and carefully educated in classical learning and the sciences. After this he studied the law, practised in the profession, and obtained the place of a counsellor in parliament. He travelled into Italy, Spain, England, Germany, and Switzerland, for the purpose of improvement. At Rome he made an harangue before pope Leo X., who highly admired his eloquence. He died at Padua, at the age of thirty-four. His works consist of epistles and harangues; they were published at Paris in 1553, with his life, by cardinal Pole. He acquired a great reputation among those scholars in that age who were ambitious of being the close imitators of the style of Cicero, and were, on that account, termed *Ciceronians*. Erasmus bestows great praises on his genius and acquisitions, but laments that all the force of his powers should have been devoted to this one object.

LONGUEIL, in *Geography*, a township of Glengary county, in Upper Canada, being the second in ascending the Ottawa river.

LONGUEVAL, JAMES, in *Biography*, a learned French Jesuit, descended from a family in humble life, was born near Peronne, in Picardy, in the year 1680. He was educated in grammar-learning at Amiens, and pursued his maturer studies at Paris, where he was soon distinguished among his fellow students by his proficiency in learning. In the year 1699, he entered into the society of Jesuits, and after he had completed his studies, he taught the belles-lettres at the college of La Fleche with great applause, during about five years, when he commenced his lectures in divinity and the sacred scriptures. He died in the year 1735, at the age of fifty-five. His reputation as a writer, is chiefly founded on his elaborate history of the Gallican church, of which he lived to publish eight volumes: these bring the latter down to the year 1137. This work displays profound erudition and deep research, and is written in a beautifully simple style. While he was engaged on this work he was allowed an annual pension of 800 livres by the French clergy, whose esteem he had secured by his learned labours, his piety, and the amiable traits of his manners. The work, afterwards completed by fathers Brunoy and Berthier, made 18 vols. 4to. Mareri.

LONGUEVILLE, in *Geography*, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Dieppe; 9 miles S. of Dieppe. The place contains 430, and the canton 7875 inhabitants, on a territory of 130 kilometres, in 29 communes.

LONGUS, in *Biography*, author of a romance in Greek prose, entitled "Pastorals," and relating to the loves of Daph-

nis and Chloe, is supposed to have lived in the reign of Theodosius the Great. His work is a curious specimen of that kind of composition in its simplest form, and is said to contain many descriptive beauties; but some of its scenes are such as the lowest modern writer would scarcely venture to paint. The best edition is that of Villoison, Gr. et Lat. Svo. in two vols. Paris 1778.

LONGUS, *Long*, an epithet given by *Anatomists* to a great number of muscles, hereby contradistinguished from *brevis*.

LONGUS *Colli*, præ-dorso-atloiden of Dumas, is a muscle situated on the anterior and lateral parts of the bodies of the three first vertebrae of the back, and the six last of the neck. It extends from the body of the third dorsal vertebra to the anterior arch of the atlas. It is elongated, broad in the middle, and pointed at the ends. On the front it is covered by the rectus capitis anticus, the pharynx, the carotid artery, the nerve of the eighth pair, and the œsophagus. Its posterior surface covers the lateral portion of the anterior surface of the bodies of the three first dorsal, and six last cervical vertebrae, to which it is attached, as well as to the intervertebral ligaments. It is also attached to the front edge of the transverse processes of the five last cervical vertebrae; and it covers the vertebral artery in the intervals of these processes. The outer edge of the muscle is attached below to the bodies of the two first dorsal vertebrae: here it is separated from the anterior scalenus by an interval in which the vertebral artery and vein are found. This margin is then fixed to the front of the transverse processes of the five last cervical vertebrae; and it is unattached in the rest of its extent. The internal edge is fixed to the longitudinal line, which may be observed on the front of the bodies of the two first dorsal, and the six last cervical vertebrae. Between these bones it is attached to the intervertebral ligaments. The inferior extremity is attached to the front and lateral portion of the body of the third dorsal vertebra: from this point it rises nearly parallel to that of the opposite side, becoming larger as far as the middle: then it gradually decreases to the superior extremity. The latter, joined to the opposite muscle, is attached to the tubercle of the anterior arch of the atlas. It is rather difficult to develop the structure of this muscle: its fleshy fibres are placed obliquely between aponeuroses, some of which cover the anterior surface, both above and below, while others are situated in the substance of the muscle. These fibres are short, although the muscle itself is long. Its action inclines the neck forwards, and resists the efforts which might tend to carry it backwards.

LONGUY, in *Geography*, a town of France, in the department of the Orne, and chief place of a canton, in the district of Mortagne; 9 miles E. of Mortagne. The place contains 1917, and the canton 7308 inhabitants, on a territory of 210 kilometres, in 11 communes.

LONGUYON, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Briey; 7 miles S.W. of Longwy. The place, in which is a considerable iron forge and foundry of cannon, contains 1532, and the canton 9509 inhabitants, on a territory of 237½ kilometres, in 26 communes. N. lat. 49° 37'. E. long. 5° 40'.

LONGWY, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Briey, situated on the Chiers. The place contains 2011, and the canton 10,743 inhabitants, on a territory of 242½ kilometres, in 35 communes. This place was merely a village, surrounded with three sharp mountains, on which was built, by Louis XIV. a new town, fortified by Vauban. N. lat. 49° 37'. E. long.

E. long. 5° 50'.—Also, a town of France, in the department of the Jura, on the Doubs; 9 miles S. of Dôle.

LONHANKO, a town of the Burman empire; 65 miles N. of Munchaboo.

LONICERA, in *Botany*, well known to every lover of British poetry by the name of Honeyfuckle, or Woodbine, received its name from Linnæus; the *Lonicera* of Plummer being a *Loranthus*. This name is intended to commemorate the merits of an old physician and naturalist, who lived during the middle of the sixteenth century. Adam Lonicer, a physician at Frankfort, was born at Marburg, Oct. 10th, 1528, and died at the age of 58. He published two volumes folio, in Latin, upon the *Materia Medica*; and a German Herbal, with wooden cuts, which are occasionally to be met with rudely coloured.—Few plants are more generally known, or admired, than several species of Honeyfuckle, whose beauty is only exceeded by the exquisite delicacy of their fragrance. Like the richest exotics they find a place in every one's fancy, and though as common as almost any other field or hedge plant, they have always been held in the greatest estimation.—Linn. Gen. 93. Schreb. 128. Willd. Sp. Pl. v. 1. 982. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 260. Ait. Hort. Kew. ed. 2. v. 1. 377. Lamarck Illustr. t. 150. (Caprifolium; Tournef. t. 378. Juss. 219. Gærtn. t. 27.—*Periclymenum*; Tournef. t. 378.—*Chamaecerasus*; Tournef. t. 379.—*Xylosteon*; Tournef. t. 379. Juss. 212.—*Diervilla*; Tournef. Act. 1706. t. 7. f. 7. Dill. Gen. App. 154. Juss. 211.—*Symphoricarpos*; Dill. Hort. Elth. 273. Juss. 211.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Aggregate*, Linn. *Caprifolia*, Juss.

Gen. Ch. *Cal.* Perianth superior, five-cleft, small. *Cor.* of one petal, tubular; tube oblong, gibbous; limb in five revolute segments, one of which is more deeply separated. *Stam.* Filaments five, awl-shaped, about as long as the corolla; anthers oblong. *Pist.* Germen inferior, roundish; style thread-shaped, the length of the corolla; stigma obtusely capitate. *Peric.* Berry umbilicate, of two cells. *Seeds* roundish, compressed.

Obs. The synonyms above quoted are all referred by Linnæus and succeeding writers to *Lonicera*, by whom the generic names of Tournefort and Dillenius are retained for the sake of distinguishing the several species originally so called. We find the following remarks upon their differences in the *Genera Plantarum*.—*Caprifolium* has the lower segment of the limb separated twice as deeply as the rest, and the berries distinct.—*Periclymenum* has all the divisions of the corolla equal; the berries also distinct.—*Chamaecerasus* has the lower division of the corolla twice as deeply cut, with two berries seated upon the same base.—*Xylosteon* has the divisions of the corolla almost equally separated, and two berries on the same base. In *Symphoricarpos*, the corolla is nearly bell-shaped; the fruit simple, two-celled, seeds foliary.

L. alpigena and *cerulea* are remarkable for having one germin for two florets, as in *Mitchella*.

Eff. Ch. Corolla of one petal, irregular. Berry inferior, of two cells, with several seeds.

Thirteen species of *Lonicera* are described in the *Species Plantarum* of Linnæus, sixteen in the *Syst. Veg.* ed. 14, and twenty by Willdenow. The genus is divided into three sections, from which we have selected the following examples. Some of these sections, as it will appear, comprehend, each of them, more than one of Tournefort's supposed genera.

SECT. 1. *Periclymenum*, stem twining.

L. Caprifolium. Pale perfoliate Honeyfuckle. Linn.

Sp. Pl. 246. Engl. Bot. t. 799. Jacq. Austr. t. 357.—Flowers ringent, whorled, terminal. Leaves deciduous; the uppermost united and perfoliate.—First known as a native of this country from being found by the Rev. Mr. Relhan at Hinton near Cambridge. It flowers in May or June.—Stem shrubby, woody, twining. Branches nearly opposite, round, smooth. Almost all the leaves are combined, elliptical, obtuse, entire, smooth, rather glaucous beneath; the upper one, in united perfoliate pairs, somewhat orbiculate, accompanying the flowers. Flowers in whorls, spreading, yellowish, with a flesh-coloured tube, very fragrant. Berries of an orange red, crowned by the almost entire calyx.

L. Periclymenum. Common Honeyfuckle, or Woodbine. Linn. Sp. Pl. 247. Engl. Bot. t. 800. Curt. Lond. fasc. 1. t. 15. Fl. Dan. t. 908.—Heads of flowers ovate, imbricated, terminal. Leaves all separate, deciduous. Corolla ringent.—Found almost universally in groves and hedges, flowering in June and July, occasionally in the autumn.—Stem shrubby, woody, twining. Branches opposite, round. Leaves opposite, on very short footstalks, elliptical, entire, sometimes pubescent, glaucous beneath. Flowers in a terminal head, spreading in a radiate manner, yellowish-white, and bluish-coloured, very fragrant, and more particularly so early in the evening. Berries red, crowned with the five-toothed calyx, bitter, with a sweetish flavour.—Dr. Smith observes that this species is liable to many variations in the different degrees of smoothness or hairiness of its leaves, fruit, and younger branches; and that, by the coast, its flowers are often quite green.—A remarkable variety sometimes occurs with sinuated, variegated leaves, called the Oak-leaved Honeyfuckle.

SECT. 2. *Chamaecerasus*, Stalks bearing two flowers.

L. Xylosteum. Upright Honeyfuckle. Linn. Sp. Pl. 248. Engl. Bot. t. 916.—Stalks two-flowered. Berries distinct. Leaves entire, downy.—Admitted as an English plant by Dr. Smith since the publication of his Flora, on the authority of Mr. W. Borrer, who found it "growing plentifully, and certainly wild, in a coppice called the Hacketts, to the east of Houghton-bridge, four miles from Arundel, Sussex." It flowers in July.—Stem upright, bushy, much branched. Leaves opposite, on footstalks, ovate, clothed with soft hairs, deciduous. Flowers odororous, in pairs, on solitary, axillary stalks, shorter than the leaves, yellowish-white, tinged with red, downy. Berries oval, red, containing six or more seeds.

L. cerulea. Blue-berried upright Honeyfuckle. Willd. n. 14. Pall. Ross. v. 1. p. 1. 58. t. 37. Jacq. Austr. App. t. 17.—Two flowers on a stalk. Berries united, globular. Styles undivided.—A native of Switzerland, Austria, Siberia, and the islands adjacent to America. It flowers in the spring.—Stems three or four feet high. Branches slender, covered with a smooth, purplish bark. Flowers white, two on a stalk. Berries of a beautiful blue colour, single and distinct.—The wood of *L. cerulea* is very hard, and handsomely veined with grey and pale yellow. The juice of the berry stains paper of a strong purple colour, and might perhaps be useful in dyeing.—The buds of this shrub lasted three together, one above another, being provided for three years beforehand.

SECT. 3. *Stem erect*. Stalks many-flowered.

L. Symphoricarpos. Shrubby St. Peter's-wort. Linn. Sp. Pl. 249. (Symphoricarpos foliis alatis; Dill. Elth. 371. t. 278. f. 360.)—Heads of flowers lateral, on footstalks. Leaves nearly sessile.—A native of Virginia and Carolina, where it flowers in the autumn.—Stem about four feet high, sending forth many slender branches. Leaves

opposite, ovate. *Flowers* in whorls, round the stalk, small, of a greenish colour. *Berry* hollow and fleshy, containing cartilaginous, roundish seeds.

L. Diervilla. Yellow-flowered upright Honeyfuckle. Linn. Sp. Pl. 249 (*Diervilla*; Dill. Gen. App. 154. t. 10. Linn. Hort. Cliff. 63. t. 7.)—Heads of flowers terminal. Leaves serrated. A native of North America, and first introduced into Europe by M. Dierville, a French surgeon, whose name it still commemorates. It flowers from May to September. —*Stem* about three feet high. *Bark* of a reddish colour. *Leaves* opposite, slightly serrated, pointed. *Flowers* small, pale yellow, two or three together at each division of the bunch. *Berries* oval, black, with one hard seed in each cell. They seldom, however, come to maturity in this country.

LONICERA, in *Gardening*, contains plants of the deciduous, flowering, shrubby, and evergreen kinds; of which the species mostly cultivated are, the black-berried upright honeyfuckle (*L. nigra*); the Tartarian upright honeyfuckle (*L. Tatarica*); the fly honeyfuckle (*L. xylosteum*); the Pyrenean upright honeyfuckle (*L. Pyrenaica*); the red-berried upright honeyfuckle (*L. alpigena*); the blue-berried upright honeyfuckle (*L. cerulea*); the shrubby St. Peter's-wort (*L. lymphoriarpos*); the yellow-flowered upright honeyfuckle (*L. diervilla*); the common honeyfuckle (*L. periclymenum*); the Italian honeyfuckle (*L. caprifolium*); the trumpet honeyfuckle (*L. sempervirens*); and the evergreen honeyfuckle (*L. grata*).

The second sort varies in shady groves, and other similar situations, with white flowers.

And the ninth kind has several varieties, as the *late red*, which produces a greater variety of flowers together, than either the Italian or Dutch sorts, making a finer appearance than either of them during the time of flowering; but it has not been so long cultivated as the latter. This was formerly termed the Flemish honeyfuckle.

There are also sometimes varieties with striped leaves.

The Dutch variety may be trained with stems, and formed into heads, which the wild sort cannot, the branches being too weak and trailing for the purpose.

And there are two sub-varieties of it, the *long blowing*, and the *late red*, in which the stems are stronger, the leaves, flowers, and heads of berries larger, and the corollas redder than in the woodbine sort; the oak-leaved variety has sinuate leaves, cut like the oak, but smooth.

And there is likewise a variety which has variegated leaves.

The tenth species has a yellow variety, in which the shoots are much similar to it, but the bark darker in colour, the leaves of a deeper green, the flowers of a yellowish-red, appearing a little after it, being not of much longer duration, but are succeeded by red berries, containing one hard seed inclosed in the soft pulp in each, which ripens in the autumn.

And besides this, some mention other varieties, such as the early red-flowering, the late red-flowering, and the evergreen red-flowering.

Method of Culture.—An increase in all these plants may be effected either by layers or cuttings, but the latter is the better practice. The layers should be made from the young shoots, and be laid down in the autumn or early spring, the straggling tops being removed, when, by the following autumn, they will have taken root, and should be cut off from the plants, being either planted where they are to remain, or into a nursery to be trained for standards, by fixing down stakes to the stem of each plant, to which the principal stalk should be fastened, all the others being cut off; train-

ing each of them to the intended height, when they should be shortened to force out lateral branches, and these be again stopped to prevent their growing too long. By constantly repeating this as the shoots are produced, they may be formed into a sort of standard; but if regard is had to their flowering, they cannot be formed into regular heads, as the constant shortening will destroy the flower-buds, and prevent the desired effect.

In respect to the cuttings, they should be taken from the strong shoots of the former summer, with three or four joints, and be placed in rows in a shady border, to the depth of two or three of them, a foot apart, and six inches from plant to plant. When they have taken good root in the autumn or spring following, they may be removed into the nursery, and be planted out in rows two feet distant, and a foot asunder in them, where they may be kept a year or two, till wanted for planting out where they are to remain.

The eighth sort may be raised from suckers, which it affords in plenty, by taking them off, and planting them as above in the autumn in a rather moist soil.

Several of the sorts may likewise be increased by sowing the seed or berry in a bed of light mould in the autumn, to the depth of an inch. The plants rise in the first or second spring; and afterwards require the same management as the others.

In regard to their management afterwards, the only culture which any of them require, is, in the upright sorts, to have their straggling shoots shortened, and the dead wood cut out; and those trained as climbers, to have their branches conducted in a proper manner upon their respective supports; and every year all rambling shoots reduced and trained as may be proper, so as to preserve them within due limits and order, except where they are designed to run wild in their own rural way, especially those intended to climb among the branches of trees, shrubs, and bushes; those also intended to cover arbours and seats, should be pruned and trained annually, laying the shoots along to their length, till they have covered the allotted space; shortening or clearing out all such stragglers as cannot be properly trained; also such of those sorts as are trained against walls, &c. must have an annual pruning and training, by going over them two or three times in summer, laying in some of the most convenient proper shoots, some at their length, shortening or retrenching others, as necessary, to preserve regularity, and the proper succession of flowers; being careful to train enough, at this time, of such as appear necessary to continue the bloom as long as possible; and in winter pruning, all those left in summer, which may appear superfluous or unnecessary, should be turned out, shortening all such as are too long for the space allotted for them, especially all those with weak straggling tops, nailing in the remaining proper branches and shoots close to the wall, or other support which they may have.

They may all be introduced with propriety in plantations, both from the variety of their different growths, and the ornament and fragrance of their flowers; though the flowers of the upright kind are not so showy as those of the trailers; but they exhibit an exceedingly agreeable variety. But the trailing species have the greatest merit, not only in their numbers, but size, elegance, and odour, as well as in their duration. The shrubs of all the sorts are, notwithstanding, proper to be introduced in shrubberies, the upright kinds to intermix as standards. The trailing kinds, whose branches are great ramblers, and, without support, trail along the ground, should generally be introduced as climbers, having stout stakes placed to each of them to climb upon, which they

they effect by ascending spirally round the support, to a considerable height; and also be placed to ascend round the stems of trees, and to climb among the boughs of the adjacent bushes, shrubs, and hedges, which they effect in a very agreeable manner, by interweaving their branches with them. The climbers are likewise proper for training against walls and arbours, &c. for the ornament and fragrance of their flowers, laying their branches in, four or five inches asunder; thinning out the superabundant shoots annually, and training in some of the most robust for succession wood, either at full length, or shortened, as most proper to fill the space or vacancy that may be wanted to be covered.

The evergreen kinds are principally of the climbing tribe, and have much effect in their evergreen foliage, and the elegance of their flowers, as well as their long continuance in blow.

The uncommon beauty, and exquisite fragrance of the flowers in the ninth species, entitle it to a place in most sorts of plantations of the ornamental kind. In climbing, it turns from east to west, in the manner of most of our climbing plants; and in common with them bears clipping and pruning well; as in a state of nature, those plants which cannot ascend without the aid of others, are often liable to lose great branches; they have consequently a proportionate vigour of growth given them, in order to restore such accidental damages. It is however subject, when planted near building, to be injured and disfigured by *aphides*, which are vulgarly termed *blights*; these insects are not very numerous in the spring season; but as the summer advances, they increase in a very rapid manner; their first attacks should, of course, be carefully attended to, and the branches on which they first fix be cut off and destroyed, as when they have once gained ground they are defended by their numbers. Small plants may however be cleared of them by the use of tobacco dust, or Spanish snuff, but this method is not practicable for large trees. The leaves of the plants are likewise liable to be punctured and curled up by a small caterpillar, which produces a beautiful little moth, the *phalæna tortrix*. About the evening also, some species of sphinges or hawk-moths are often seen to hover over the blossoms, and with their long tongues extract the honey from the very bottoms of the flowers.

LONICERUS, or **LONICER**, **JOHN**, in *Biography*, a learned German, was born in 1499: after having received a good education, he became himself a professor at Marburg, where he died about the year 160. He was author of a Greek and Latin Lexicon, and published an edition of Dioscorides. Moreri.

LONIGO, or **LEONICO**, in *Geography*, a town of Italy, in the Vicentin, seated on a river called Fiume Novo, and containing several churches and monasteries; 14 miles S.S.W. of Vicenza.

LONKA, a town of Poland, in the palatinate of Podolia; 44 miles N. of Kaminiac.

LONSCHAKOVA, a town of Russia, in the government of Irkutsk; 40 miles N.N.E. of Stretensk.

LONSCHIN, a town of Prussia, in the palatinate of Culm; 10 miles S. of Culm.

LONS-LE-SAULNIER, a town of France, and principal place of a district, in the department of the Jura, formerly celebrated for its salt-works, but now discontinued. The place contains 6041, and the canton 14,999 inhabitants, on a territory of 112½ kilometres, in 23 communes. N. lat. 46° 40'. E. long. 5° 38'.

LONTARUS, in *Botany*, Rumph. Amboin. v. 1. 45. t. 10. Juss. 39. Gært. t. 8, a barbarous name of Rum-

phus for the *Borassus flabelliformis* of Linnæus. See BORASSUS.

LONT-CHOUDESONG, in *Geography*, a town of Thibet; 35 miles N.N.E. of Laffa. N. lat. 29° 58'. E. long. 92° 14'.

LONTHOIR, a town of the island of Banda, in the East Indian sea.

LONTOU, a town of Africa, in Galam, on the Senegal; 60 miles S.E. of Galam.

LOO, a town of France, in the department of the Lys; six miles S.S.E. of Dixmude.

LOOBOE, or **LOEBOE**. See **LOEBOE**.

LOOCALLA, a town of Congo, on the Zaire; 90 miles W. of St. Salvador.

LOOCHRISTI, a town of France, in the department of the Scheldt, and chief place of a canton, in the district of Ghent. The place contains 3056, and the canton 14,432 inhabitants, on a territory of 140 kilometres, in 7 communes.

LOODUERA, a town of Bengal; 11 miles S. of Rongatpour.

LOOE, a small island near the coast of Cornwall; two miles S.E. of Looe.

LOOE, *East*, a borough and market town in the parish of St. Martin, hundred of West, and county of Cornwall, England, is situated at the mouth of the river Looe, 12 miles from Plymouth, and 233 west from London. It is mostly built on a flat piece of ground, having the river on the west, and the sea on the south. The streets are narrow, and the houses built with slate. The port is protected by a small battery and breast-work. The town was incorporated by queen Elizabeth in 1587; the government is vested in a mayor and nine burgesses, who jointly elect a recorder. Two members have been returned to parliament ever since 13 Elizabeth; the right of election is in the mayor, burgesses, and freemen; in number about fifty. In the survey taken in 1801, East Looe was found to contain 126 houses, and 467 inhabitants, who were chiefly supported by the pilchard fishery, and the trade connected with the port. Four annual fairs are held, and a weekly market on Saturdays. Beauties of England and Wales, vol. ii.

LOOE, *West*, originally named *Portpigham*, a borough and market town in the parish of Talland, hundred of West, and county of Cornwall, England, is also situated at the mouth of the river Looe, and is connected with East Looe by a stone bridge of fifteen arches. West Looe formerly was much more considerable in point of trade, &c. than East Looe; it now presents a long street of mean irregular houses, with a small town-hall, anciently a chapel, and a few other buildings on the brink of the river. This borough, as well as the adjoining one, received its first charter of incorporation from queen Elizabeth, vesting the government in a mayor, and twelve burgesses, who with the freemen, in the whole about 50, elect two members of parliament. In the population return for 1801, West Looe was stated to consist of 82 houses, and 376 inhabitants. A fair is held annually, and a market every Saturday. Beauties of England and Wales, vol. ii.

LOOF, or as it is usually pronounced, *Luff*, a term used in conding of a ship. Thus,

Loof up, is to bid the steersman keep nearer to the wind.

Loof into a harbour, is to sail into it close by the wind.

Loof, to spring the, or luff, is when a ship that was going large before the wind is brought close by the wind.

When a ship sails on a wind, that is, on a quarter-wind, they say to the steersman, *keep your luff! veer no more! keep her*

her to! touch the wind! have a care of the be-latch! All which words signify much the same thing, and bid the man at the helm to keep the ship near the wind.

Loof of a ship, denotes the after-part of a ship's bow; or that part of her side forward where the planks begin to be incurvated into an arch, as they approach the stem. Hence, the guns which lie here are called *loof-pieces*.

Loof-hook, in a *Ship*, a tackle with two hooks to it, one of which is to hitch into the crengle of the main and fore-fail, and the other is to hitch into a certain strap, which is spliced into the chiefs-tree, and so down the fail. Its use is to succour the tackles in a large fail, that all the strefs may not bear upon the tack. Sometimes also it is used when the tack is to be seized the surer.

Loof-tackle, or *Luff-tackle*, a large tackle, larger than the jigger-tackle, but smaller than those which hoist the heavier materials into and out of the vessel, such as the main and fore tackles, the stay and quarter tackles, &c. serving to lift all the small weights in or out of the ship, and otherwise variously employed as occasion requires.

Loof, or *Loop*, a corn-measure at Riga, equal to 3078 cubic inches; of which 4324 are equal to ten English quarters.

LOOHOGGO, in *Geography*, one of the smaller Friendly islands, surrounded by a reef of rocks. S. lat. $19^{\circ} 41'$. E. long. $185^{\circ} 36'$.

LOOJAMA, a town on the E. coast of the island of Timor. S. lat. $8^{\circ} 27'$. E. long. $126^{\circ} 18'$.

LOOKING GLASS, a plain polished glass speculum, or mirror, to one side of which a plate of tin-foil is made to adhere by means of quicksilver; which being impervious to the light, reflects its rays, and so exhibits the images of objects placed before it.

In consequence of this construction, the looking-glass makes a double reflection of every object, *viz.* one from the upper surface, which is the weakest, and another from the under surface, which is contiguous to the tin-foil. When a person stands just before the glass, the two reflections coincide, and he perceives one image; but if he stands oblique, as at A, (*Plate IX. Optics, fig. 10.*) and views the reflection D, of an object B C, situated on the other side, he will then perceive two images, *viz.* one caused by the upper, and the other caused by the lower surface of the glass E F. If the object B C be very luminous, such as a lighted candle, then the eye at A will perceive a great succession of candles at D, gradually decreasing in splendour; the cause of which phenomenon is, that the strong reflection from the under surface of the glass is again reflected from the upper surface, and this again by the lower, &c.

The theory of looking-glasses, and the laws whereby they give the appearance of bodies, see under *MIRROR*.

Looking-glasses, the manner of grinding and preparing, is as follows:—a plate of glass is fixed to a horizontal table of free-stone or wood, of about the same size, and cemented to it by Paris plaster; and to another lesser table is fixed in the same manner another plate. Over the first plate is sprinkled fine sand and water, in a sufficient quantity for the grinding, and the second or less plate is laid on it; and thus worked this way and that way, till each has planed the other's surface. These plates are made to rub against each other evenly and steadily by a kind of hand-mill, the wheel of which is wrought by a man, or if the plates be large by two men, who regulate the pressure as they think proper. As they begin to become smoother, finer sand is successively used. When one side of the plate is finished, the plaster that cemented it is picked off, and the plate turned, so

that the other side may be ground in the same manner. Towards the close of the operation of grinding, the pressure is increased by loading the upper plates with flat stones of different thicknesses. This process lasts about three days, and it is of great importance that the surfaces should be perfectly flat and parallel, which is determined by the ruler and plumb-line. In order to complete this process, emery of different finenesses is used, and great care is taken in separating and sorting them. This is done by putting into a vessel of water a quantity of rough emery, and well stirring it: the coarsest particles will sink to the bottom, and the finer will be held suspended for some time by the supernatant liquor. This liquor is poured off, and after some time, about 20 minutes, the finer particles will subside. More water is then added to the vessel, and the emery stirred again; and after remaining at rest about 15 minutes, the supernatant liquor is poured off; and this by rest furnishes an emery of the second degree of fineness. The same operation is repeated twice more at the different intervals of about five minutes and half a minute; by which two other sorts are obtained. The wet emery obtained from all these liquors is separably heated over a stove to evaporate the water, and when nearly dry, is made up into balls for the further operation. The plates are then ground on both sides with two or three emerys, beginning with the coarsest, and finished with great care. They are now perfectly even, and the scratches, which after the first operation remained and rendered them almost opaque, disappear. (See *GRINDING*.) For the method of polishing looking-glasses and mirrors, we refer to the article *POLISHING*.

The plates being polished, a thin blotting paper is spread on a table or marble slab; and sprinkled with fine powdered chalk; and this done, over the paper is laid a thin lamina or leaf of tin, on which is poured mercury, which is to be equally distributed over the leaf, with a hare's foot or cotton. Over the leaf is laid a very thin smooth paper, of which the kind called fan-paper is best, and over that the glass plate. With the left hand the glass-plate is pressed down, and with the right the paper is gently drawn out; which done, the plate is covered with a thicker paper, and loaded with a greater weight, that the superfluous mercury may be driven out, and the tin adhere more closely to the glass. When it is dried, the weight is removed, and the looking-glass is complete.

Some use an ounce of mercury with half an ounce of marcasite or bismuth, melted by the fire; and lest the mercury evaporate in smoke, pour it into cold water; and when cold, squeeze it through a cloth or leather. Some also add a quarter of an ounce of lead and tin to the marcasite, that the glass may dry the sooner. For more particular directions in the conduct of this operation, see *SILVERING*.

In the *Phil. Trans.* N. 245, we have a method of *foliating* (see *FOLIATING*) globe looking-glasses, communicated by sir R. Southwell. The mixture is of quicksilver and bismuth, of each three ounces, and tin and lead, of each half an ounce; to the last throw in the marcasite, and afterwards the quicksilver; stir them well together over the fire; but they must be taken off, and be towards cooling before the quicksilver be put to them. When the mixture is used, the glass should be well heated, and very dry; but it will do also when it is cold, though best when the glass is heated.

Mr. Boyle's method, which he prefers to any which he ever met with in print, is this: take tin and lead, of each one part, melt them together, and immediately add of good

good tin-glass, or bismuth, two parts; carefully skim off the dross; then take the crucible from the fire, and before the mixture grows cold, add to it 10 parts of clear quick-silver, and having stirred them well together, keep the fluid in a new clean glass. When you are going to use it, first purge it by straining it through linen, and gently pour some ounces into the glass to be soliated through a narrow paper funnel, reaching almost to the glass, to prevent the liquor from flying to the sides. After this, by dextrously inclining the glass every way, endeavour to flatten it to the internal surface; which done, let it rest for some hours; then repeat the same operation, and so continue at times, till the liquor is slowly passed over, and equally fixed to the whole superficies; which may be discerned by exposing the glass to the eye between that and the light. Boyle's works abr. vol. i. p. 129.

For the method of blowing and eaking glass, and the choice of the materials for looking-glasses, see GLASS.

LOOKING-GLASS, *Venus's*, in Botany. See CAMPANELLA.

LOOKNAPOUR, in Geography, a town of Hindoostan, in Oude: 15 miles S.W. of Kairabad.

LOOK-OUT, CAPE, a cape on the coast of North Carolina, being the southern part of a long, insulated, and narrow strip of land. E. of Core Sound. Its N. point forms the S. side of Ocrecochi inlet, which leads into Pamlico Sound; N.E. of Cape Fear, and S. of Cape Hatteras, in about N. lat. 34° 50'. Its excellent harbour has been filled up with sand since the year 1777.—Another cape, of the same name, lies on the southern coast of Hudson's bay, in New South Wales, E.S.E. of the mouth of Severn river. N. lat. 56°. W. long. 84°.

LOOK-OUT, in Sea Language, denotes a watchful attention to some important object, or event, which is expected to arise from the present situation of a ship, &c. It is principally used when there is a probability of danger from the real or supposed proximity of land, rocks, enemies, &c. There is always a look-out kept on a ship's forecattle at sea, to watch for any dangerous objects lying near her track; the mate of the watch accordingly calls often from the quarter deck, *look out afore there!* to the persons appointed to this service. Falconer.

LOOKSEENGAR, in Geography, a town of Bengal; 35 miles N.W. of Rangur.

LOOL, in Metallurgy, a vessel made to receive the washings of ores of metals. The heavier or more metalline parts of the ores remain in the trough to which they are washed; the lighter, and more earthy, run off with the water, but settle in the lool.

LOOM, in Geography, a town of Norway; 60 miles S.E. of Rindal.

LOOM, the weaver's frame: a machine whereby several distinct threads are woven into one piece.

Looms are of various structures, accommodated to the various kinds of materials to be woven, and the various manners of weaving them; viz. for woollens, silks, linsens, cottons, cloths of gold; and other works, as tapestry, ribbands, stockings, &c. divers of which will be found under their proper heads. See WEAVING.

The weaver's loom-engine, otherwise called the Dutch loom-engine, was brought into use from Holland to London, in or about the year 1676.

LOOM, *Hair*, in Law. See HEIR-LOOM.

LOOM, at Sea. If a ship appears big, when at a distance, they say she looms, or appears a great sail; the term is also used to denote the indistinct appearance of any other distant objects.

The most remarkable phenomena of this kind, depend on

the accidental variations of the temperature of the air at different parts, producing great irregularities in its refraction, especially near the horizon. Accordingly the rarefaction of the air in the neighbourhood of the surface of water, of a building, or of the earth itself, occasions a distant object to appear depressed instead of being elevated, and to be sometimes seen at once both depressed and elevated, so as to appear double, one of the images being generally in an inverted position, as if the surface possessed a reflective power; and there seems to be a considerable analogy between this kind of refraction and the total reflection which happens within a denser medium. See FATA MERGANA.

Loom-Gale, a gentle, easy gale of wind, in which a ship can carry her top-sails a-trip.

LOOMAKA, in Geography, a town of Bootan; 28 miles S. of Tassafadon.

LOON, in Ornithology. See COLYMBUS *glacialis*, and COLYMBUS *fluvialis*.

LOONENBURG, in Geography, a town of Green county, New York, near the city of Hudson.

LOONGHEE, a town of the Birman empire, on the Irawaddy, which has a celebrated temple; 55 miles N. of Prome. N. lat. 19° 42'.

LOONPOUR, a town of Hindoostan, in Guzerat; 40 miles E. of Junagar.

LOOP, in the Iron Works, is a part of a sower or block of cast iron broken or melted off from the rest, and prepared for the forge or hammer. The usual method is, to break off the loop of about three quarters of a hundred weight. This loop they take up with their slinging-tongs, and beat it with iron sledges upon an iron-plate near the fire, that so it may not fall to pieces, but be in a condition to be carried under the hammer. It is then placed under the hammer, and a little water being drawn to make the hammer move but softly, it is beat very gently, and by this means the dross and foulness are freed off; and after this they draw more and more water by degrees, and beat it more and more till they bring it to a four square mass, of about two feet long, which they call a bloom.

Loop, in Rural Economy, the hinge of a door or gate. See GATE.

Loop-Holes, in Sea Language, are holes made in the coamings of the hatches of a ship, to fire muskets through in a close fight.

LOOPHEAD, in Geography, a cape of Ireland, in the county of Clare, being the north point of the mouth of the Shannon. On this headland is a lighthouse. N. lat. 52° 30'. W. long. 9° 50'.

LOOPING, in Metallurgy, a word used by the miners of some counties of England, to express the running together of the matter of an ore into a mass, in the roasting, or first burning, intended only to calcine it so far as to make it fit for powdering. This accident, which gives the miners some trouble, is generally owing to the continuing of the fire too long in this process.

LOOSA, in Botany, a name which originated with Adanson, but of whose meaning or derivation we find no account, except that it has been supposed intended to commemorate some Spanish botanist, of whose merits or name nothing else is known. Adanson writes it *L. sp.*, and he is followed by Jacquin and the French botanists. Linnæus, Murray and Schreber use the above orthography, which we have retained, though we much suspect it to have been originally an error of the press; but having nothing better to guide us, we leave matters as we find them. It is pity so fine a genus should not have a certain or intelligible appellation.

tion. Linn. Syst. Nat. ed. 12. v. 2. 364. Syst. Veg. ed. 14. 494. Schreb. 360. (Loafa; Adarf. v. 2. 501. Jacq. Obl. fasc. 2. 15. t. 38. Willd. Sp. Pl. v. 2. 1176. Mart. Mill. Dict. v. 3. Juss. 322. Lamarck Dict. v. 3. 758. Loaza; Lamarck Illustr. t. 426.)—Class and order, *Polyandria Monogynia*. Nat. Ord. *Onagris affine*, Juss.

Gen. Ch. Cal. Perianth almost entirely superior, of five lanceolate, spreading, permanent, equal leaves. Cor. Petals five, large, obovate, hooded, spreading, equal, attenuated at their base into slender claws. Nectary of five leaves, alternate with the petals, approximated in the form of an acute cone, each rather shorter than the petals, lanceolate, corrugated, awned with a double bristle. Stam. Filaments numerous, capillary, in parcels of from 15 to 17 opposite to each petal, longer than the nectary; anthers incumbent, roundish. Pist. Germen somewhat ovate, more than half inferior; style thread-shaped, erect, the length of the stamens; stigma simple, obtuse. Peric. Capsule turbinate, of one cell, opening with three valves at the top, which are half-ovate, acute, finally spreading. Seeds numerous, ovate, small. Receptacles three, linear, longitudinal.

Eff. Ch. Calyx of five leaves. Petals five. Nectary of five leaves alternate with the petals. Capsule half-inferior, of one cell, three valves at the top, and many seeds.

Obs. This genus is, as Jacquin observes, nearly akin to *Mentzelia*.

1. *L. hispida*. Lamarck t. 426. fig. 1. (*L. urens*; Jacq. Obl. fasc. 2. 15. t. 38.)—Very bristly. Leaves alternate, doubly pinnatifid. Edges of the calyx-leaves revolute.—Gathered by Dombey, in sandy ground in Lima. The root is annual, fibrous. Stem erect, from one to three feet, or more, in height, slightly subdivided, leafy, round, beset with innumerable, horizontal, tawny, bristles, which are observable, more or less, in all the species. Lamarck has found each of these bristles to be furnished with a slight bag at its base, and thence he reasonably concludes that the plant stings like a nettle, whose venom is lodged in similar bags. These stings are, in the plant we are describing, intermixed with fine down. Leaves alternate; the lower ones stalked; the rest sessile; all doubly pinnatifid, more or less deeply, two or three inches long, somewhat bristly, downy beneath; their divisions and teeth irregular and obtuse. Flower-stalks scattered, generally opposite to the leaves, foliary, simple, single-flowered, bristly, above an inch long, destitute of bracteas. Flowers large, handsome and very remarkable, above an inch wide. Petals yellow, bristly on the outside, concave. Nectaries white, dotted with red and green. Stamens at first erect, then lying in five tufts upon the petals, conspicuous for their dark anthers. This plant dries remarkably well, and has the appearance of being very showy when growing. We never heard of this or any other species being cultivated in Europe, but they would doubtless succeed with the same treatment as the *Calceolaria pinnata*.

2. *L. contorta*. Lamarck n. 2. t. 426. fig. 2—Stem twining. Leaves opposite, stalked, somewhat runcinate, toothed. Capsule twisted.—Gathered by Joseph de Jussieu in Peru. One of his specimens is figured and described by Lamarck, with a weak twining stem, two feet or (probably) much more in height, moderately bristly. Leaves opposite, stalked, about three or four inches in length, pinnatifid, bristly, sharply toothed or cut, their lowest pair of lobes longest and most reflexed. Flowers on long axillary simple stalks, yellow.

3. *L. acanthifolia*. Lamarck n. 3. (Ortiga chilienfis urens, acanthi folio; Feuill. Peruv. v. 2. 757. t. 43.)—

Leaves opposite, pinnatifid, sharply toothed; the upper ones sessile. Calyx reflexed. Petals with two terminal teeth. Gathered by Feuillée in a valley in Chili. Stem six feet high, bristly, branched, hollow. Leaves opposite, resembling those of *Argemone mexicana*, nine or ten inches long, and six broad, deeply pinnatifid, with numerous, sharp, bristly teeth; the lowermost stalked, the rest sessile. Flowers large, stalked as in the foregoing; their petals dark-green and bristly at the outside, bright red within; nectary yellow, striped with red. No one but Feuillée seems to have known this remarkable species.

4. *L. grandiflora*. Lamarck n. 4.—“Leaves opposite or alternate, ovate, somewhat heart-shaped, lobed; hoary beneath. Petals flattish.”—Gathered by Joseph de Jussieu in Peru. We have never seen a specimen of this. Lamarck describes it as remarkable at first sight for the glaucous hoariness of the under-side of its leaves, and the great size of its flowers, which, when expanded, are at least three inches broad. The herb is very bristly. Leaves about three and a half inches long, two and a half wide.

5. *L. chenopodiifolia*. Lamarck n. 5.—Leaves scattered, stalked, ovate, cut and toothed. Flowers drooping, in terminal, simple, somewhat leafy, clusters. Fruit oblong, very bristly. Gathered in Peru, by Joseph de Jussieu, whose specimens were described by Lamarck. We have one gathered in moist situations in Lima, by Dombey. The root is fibrous and annual, as, probably, in the whole genus. Stem 12 to 15 inches high, erect, slightly branched, roughish with deflexed hairs. Leaves an inch or two long, one broad, few, ovate, bluntly pointed, variously toothed, rough with small dense bristles. Flowers drooping, in a long, loose, terminal cluster, with a few small leaves about its lower part, rather small, yellow; the nectary apparently reddish. Fruit oblong, pendulous, beset with long, prominent, dense, rigid bristles.

6. *L. nitida*. Lamarck n. 6.—Stem procumbent. Leaves opposite, palmate, cut and toothed; shining above; downy beneath. Fruit turbinate, bristly. Gathered by Dombey in stony ground in Lima. The stem appears to be weak and procumbent, forked, leafy, downy, less bristly than in some of the former. Leaves palmate, heart-shaped and three-ribbed at the base, variously jagged and toothed; nearly smooth and shining above, finely downy beneath; with a few scattered bristles on both sides. The lower leaves stand on downy stalks; the upper are nearly or quite sessile. Flower-stalks from the forks of the stem, rather long, downy. Germen turbinate, downy, clothed with reflexed bristles, but far less densely than the last-described. Calyx-leaves broad and large. Dombey says, “the nectaries are very small, three-cleft and white, with three purple bristly-pointed appendages, on the outside, at their base.”

Specimens of these two last, gathered by him, are preserved in the Linnean herbarium.

LOOSE, To, in Sea Language, is to unfurl or cast loose any sail, in order to be set, or dried, after rainy weather.

LOOSE-Strife, in Botany. See *LYSIMACHIA*.

LOOSE-Strife, Padded. See *WILLOW-herb*.

LOOSE-Strife, Purple and Spiked. See *LYTHRUM*.

LOOSE-Strife, Virginian. See *GAURA*.

LOOSE Style. See *STYLE*.

LOOSEDRECHT, in Geography, a town of Holland; 8 miles S. of Naarden.

LOOSEMORE, HENRY, in Biography, a bachelor of music in the university of Cambridge, 1640, and organist, first of King's college, and afterwards of the cathedral of Exeter. He composed several services and anthems, ex

officio,

Opis, for these choirs; but we believe they were never printed, or adopted elsewhere. A person of the same name, a lay singer or organist of Exeter cathedral, is said to have built the organ, which was erected in that church at the restoration; of which instrument, the largest pipe of the open diapason was 32 feet; which exceeded in magnitude that of any other organ in the kingdom.

LOOSEBONE, GEORGE, bachelor in music, of Trinity college, Cambridge. Great musicians are but few in every part of Europe, except Italy and Germany, where the courts and capitals are so numerous; but *mediocrity* produces many musicians everywhere.

LOOSENED. See *HOOP-loosened*.

LOOT, a weight in Holland, 32 of which are equal to 1lb. of commercial weight, and 24 = 1lb. of apothecaries' weight = 3lb. troy.

LOP, in *Rural Economy*, a term signifying to prune or cut away.

LOP KENT-HILL, in *Geography*, a mountain of Thibet. N. lat. 30° 14'. E. long. 85° 54'.

LOPARY, a town of Hindoostan, in Benares; 10 miles S. of Founhor.

LOPES, FERNAM, in *Biography*, the most ancient of the Portuguese chroniclers, and said to be one of the best writers of chronicles that any country can boast. He was private secretary to the infant D. Fernando, who died in captivity at Fez, afterwards became chief chronicler, and keeper of the archives. He died in 1449. He was author of the chronicles of Pedro I., of Fernando, and of Joam I. to the conclusion of peace with Castile. The chronicles of the earlier kings are variously attributed to him, or to Ruy de Pina, in whose name they are published. The chronicle of Pedro was edited in 1734 by P. J. P. Bayam, and was reprinted in 1760. That of Fernando, which is longer and more valuable, has never been published. A manuscript copy of the work is in the hands of Mr. Southey. The most important of all his writings is his chronicle of Joam, which is the history of the grand struggle between Portugal and Castile, towards the close of the fourteenth century. "No pains," says the biographer, "were spared to render it as complete as possible, neither on the part of the historian himself, nor of the king Duarte, by whose command this history of his father was written. The monarch sent into Castile to collect documents, and the chronicler, independently of the information which he had received at court from persons who had borne a part in the councils and actions of those times, went over the whole kingdom to collect testimony from all the actors in the wars, which he recorded. This was first published in 1644, soon after the Braganza revolution; never was a publication better timed; never was any book better calculated to rouse a nation by the example of their fathers, and encourage them to resist those enemies whom their fathers, under like circumstances, had conquered. It is a truly excellent and admirable work. With the great advantage of singleness and uniformity of subject, it has all the manners, painting, and dramatic reality of Froissart, conveyed in a nobler language, and vivified by a more patriotic and more poetical mind." Gen. Biog.

LOPESCO, in *Geography*, a town of Naples, in Abruzzo Ultra; 19 miles S.W. of Aquila.

LOPEZ, GREGORIO, in *Biography*, a celebrated Spanish lawyer, was born at Guadaloupe, towards the close of the fifteenth, or commencement of the sixteenth century. He edited the laws of Alonso the Wise, known by the title of "Las Siete Partidas," and added a commentary, which has been retained in most of the subsequent editions, and is included in the last. Lopez studied at Salamanca, and was

one of the royal council of the Indies. The time of his death is not known: his epitaph is in St. Anne's chapel, in the monastery of Guadaloupe, says, in the Portuguese language:

"Here lies the licentiate Gregorio Lopez, a native of this place. Pray to God for him." G. L. P.

LOPEZIA, in *Botany*, dedicated by Cavanilles to the memory of the licentiate Thomas Lopez, a native of Burgos, who had an honourable appointment in America in the reign of the emperor Charles V., and is said to have written a compendium of natural history, after his return; which still remains in manuscript, under the title of a Treatise on the three elements of air, water and earth. Cavan. Ic. v. 1. 12. Vahl. Enum. v. 1. 3. Willd. Sp. Pl. v. 1. 18. Aut. Hort. Kew. ed. 2. v. 1. 15. Lamarck Dict. v. 3. 504.—Class and order, *Monardella Monardella*. Nat. Ord. *Onagraceae*. Juss. See Sims and Koenig's Annals of Botany, v. 1. 532.

Gen. Ch. Cal. Perianth superior, of four oblong, concave, coloured deciduous leaves; three of them ascending; the fourth, rather the largest, pointing downwards. Cor. irregular. Petals four, spreading, longer than the calyx; the two uppermost oblong, erect, parallel, with a gland at the base, and supported by cylindrical claws; two lateral ones spatulate, widely spreading. Nectary obovate, folded, on a bent elastic stalk, parallel to the lower leaf of the calyx. Stam. Filament one, awl-shaped, ascending, opposite to the nectary half as long as the upper petals; anther terminal, ovate, simple, of two cells, embraced in an early date, by the folded limb of the nectary. Pist. Germen inferior, nearly globose, smooth; style thread-shaped, somewhat declining, as long as the stamen; stigma capitate, downy. Peric. Capsule globular, of four cells, opening at the top by four valves. Seeds minute, ovate, numerous. Receptacle square.

Eff. Ch. Calyx superior, of four unequal leaves. Corolla irregular, of four petals. Nectary stalked, folded, opposite to the stamen. Capsule of four cells and four valves. Seeds numerous.

1. *L. hirsuta*. Hairy Lopezia. Dryandr. in Aut. Hort. Kew. n. 1. Jacq. Coll. Suppl. v. 5. t. 15. f. 4. (L. mexicana; Willd. Sp. Pl. n. 1.)—Leaves ovate, downy. Stem round, hairy.—Native of Mexico. Mr. John Hummelmann obtained seeds from Germany, for Kew garden, in 1796. The plant is annual, kept in the stove, and flowers from September to November. We procured specimens in 1797 from the Cambridge garden. The stem is two or three feet high, branched, pale green, clothed with length soft hairs. Leaves alternate, stalked, ovate, pointed, minutely toothed, an inch or an inch and half long, of a bright light green, clothed on both sides with short soft hairs; those near the flowers small and sessile. Cylinders solitary at the end of every little branch, somewhat corymbose, leafy; their partial stalks capillary, simple, spreading, coloured, smooth. Flowers spreading, prettily variegated with pink, deep red, and white, in shape not unlike some sort of little flies. When touched, they exhibit a striking elasticity, if not irritability, in the manner in which the nectary on one hand, and the stamen on the other, fly from the pistil.

2. *L. racemosa*. Smooth Lopezia. Cavan. Ic. v. 1. 12. t. 18. Curt. Mag. t. 254. (L. mexicana; Willd. Sp. Pl. n. 1.)—Stem square, smooth, as well as the leaves. Floral leaves minute.—Native of Mexico. The first seeds that arrived in this country, were sent in a letter from Madrid in 1791, by the Abbé Cavanilles to the writer of the present article, and produced plants at Kew and Chelsea the follow-

ing year, which bloomed abundantly in the autumn, and were much admired. This species differs from the former chiefly in its smoothness, and the squareness of its stem. In other respects they are very much alike, especially in the flowers and inflorescence, so as to have been generally thought varieties. We are induced by no means certain, that the stem of the *blafia* is not frequently angular, in some degree.

3. *L. coronata*. Coronet-flowered *Lopezia*. Andr. Repol. t. 551. Dryandra. in Ant. Hort. Kew. n. 3.—Leaves smooth and shining. Stem angular, from the decurrent footstalks. Floral leaves mostly longer than the flower-stalks.—Native of Mexico. Messrs. Lee and Kennedy are said to have introduced this species in 1805, which is marked as a hardy annual in Hort. Kew. It differs from the last in being of more luxuriant growth, with larger floral leaves, the whole foliage being of a deeper more shining green. We are much inclined to suspect these differences to have arisen from differences of treatment, and that the fading of the lateral petals, as they advance in age, may be attributed to the action of strong sunshine. S.

LOPHANTHUS, from *λοφος*, a crest, and *ανθος*, a flower, is the specific name of a species of *Hyssopus*; see that article. Forster has used it to designate a genus of his own, in his *Genera Plantarum*, of the native country of which, or of its form, habit, or duration, he has said nothing, except that it is next akin to *Waltheria*; neither does any mention of it occur, as far as we can find, in his subsequent works. We presume therefore he found he had made a mistake, but we subjoin his characters of the genus. Forst. Gen. t. 14. Juss. 427. Lamarck Dict. v. 3. 594. Illustr. t. 143.—Class and order, *Pentandria Monogylia*. Nat. Ord. *Columbifera*, Linn.? *Incerta sedis*, Juss.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, in five small, equal, acute segments, permanent. Cor. Petals five, spatulate, spreading, roundish, with slender upright claws the length of the calyx. Stam. Filaments five, awl-shaped, the length of the corolla; anthers somewhat incumbent. Pyl. Germen superior, oblong, conical, hairy; style short, cylindrical, nipple-like, slightly club-shaped; stigma slightly cloven. Peric. of one cell, clothed with long hairs. Seed solitary, ovate, covered, smooth, in the bottom of the calyx.

1. *L. tomentosus*. The only species mentioned.

LOPHIA, in *Anatomy*, a term for the upper part of the cervix, or back part of the human neck.

LOPHIUS, in *Natural History*, a genus of fishes of the order Branchiostegi: the generic character is as follows: head depressed; many sharp-pointed teeth; tongue broad and armed with teeth; eyes on the upper part of the head; nostrils small; gills three; one lateral aperture; pectoral fins placed on the long branchiæ; dorsal and anal fins opposite, and near the tail; body scaleless, covered with a thin lax skin; vent in the middle; no lateral line. The fishes of this genus are of a singularly uncouth appearance; the body being thick and shapless; the head excessively large, and the fins short and broad.

Species.

PISCATORIUS. This has various English names, as the European or common angler, frog-fish, toad-fish, fishing-frog, sea-devil, &c. Body depressed; head rounded. The usual length of this species is from two to four feet, though it is sometimes found six or even seven feet long. In its form it has a resemblance to that of a tadpole. The skin of the trunk is smooth, but that of the upper parts marked by various inequalities. The eyes are large and whitish;

the lower jaw is considerably longer than the upper. There are some thread-like processes that proceed from the upper part of the head, and some shorter ones from the back, but the edges of the body are fringed at intervals with shorter appendages of a somewhat similar nature. The upper surface is brown, with deeper or paler variegation; and the under surface is whitish. The frog-fish inhabits the European seas; swims slowly; lies in ambush, in shallows, half-concealed by sea-plants or mud, and decoying its prey by moving its worm-like processes. According to the description given by Baffon the two long beards or filaments placed immediately above the nose are small in the beginning, but thicker at the end, and answer the very singular purpose of a fishing-line, to which use the animal converts them. This property of those filaments is referred to by Pliny and other naturalists, who say, "with these extended, the fishing-frog hides in muddy waters, and leaves nothing but the beards to be seen: the curiosity of the smaller fish brings them to view these filaments, and their hunger induces them to seize the bait; upon which the animal in ambush instantly draws in its filaments with the little fish that had taken the bait, and devours them without mercy." It is said if the bowels of the fishing-frog are taken out the body will appear transparent; and if a lighted candle be substituted for the intestines, as in a lantern, the whole has a very formidable appearance. This species feeds on dog-fish and other smaller fishes. The "cornubiensis," or cornish, or long-angler, or fishing-frog of Mount's bay, which has been taken as a separate species, may be regarded only as a variety.

BARBATUS. Body depressed; lower jaw bearded. It inhabits the seas of Northern Europe; is between three and four feet long, and is a very voracious fish.

VESPERTILIO. Body depressed; head rostrate: an inhabitant of the American ocean; the body is reddish, broad before, narrowed behind, and covered with radiate, sharp, patelliform tubercles; beneath with small prickles; in its mode of catching its prey it resembles the *L. piscatorius*.

HISTRIO: Harlequin angler, or American toad-fish; is of a compressed form; of a yellowish-brown colour, with irregular blackish spots, and beards on the head and body. This, which is one of the most grotesque and singular of fishes, is found in the American and Indian seas, and is a most curious and remarkable fish. It is about a foot long, and its ventral fins resemble short arms. It has been asserted, though on very doubtful authority we suspect, that instances have been known of these fishes living three days without water.

STRIATUS. Body compressed, brown; marked all over with numerous black streaks; is found on the coast of New Holland.

PICTUS. Body compressed, brown, with yellowish blotches edged with red; inhabits the southern ocean; tendrils on the nose forked at the end.

MARMORATUS. Body subcompressed, livid, varied with whitish and ferruginous spots, dorsal fin single; tendrils at the nose three-cleft at the end. Native of the Pacific ocean; observed about the coast of Otaheite, &c.

MONOPTERIGIUS. Body depressed, blackish, beneath whitish; fin above the tail almost erect, ramose. It inhabits the seas of Australasia. It is not quite agreed where to place this very singular fish; it has no fin except the lobate one just above the tail; the eyes are vertical, approximate, and far behind the snout: the body is roundish, a little tapering to both ends, and the tail at the end of the body rounded.

MURICATUS; Depressed angler: described first by La Cèpe,

Cope, under the name "*Lophie faijas*:" body flat, orbicular, and covered with numerous small tubercles, tipped with divided or radiated spines; hind part contracting suddenly, covered with similar spines, and terminated by the tail fin, which is of a moderate size, and slightly rounded; pectoral fins large, and situated lower than those in the common angler. It is about four inches in length.

LOPO, in *Geography*, a lake of Thibet, about 18 miles long and nine broad. N. lat. 42° 20'. E. long. 89° 52'.

LOPPED MILK, in *Rural Economy*, such as has stood till it becomes sour and curdled.

LOPPEN, in *Geography*, a small island in the North sea, near the coast of Lapland. N. lat. 69° 43'.

LOPPING, in *Rural Economy*, the operation of cutting off the lateral or other branches of trees. Most old trees are found hollow within, which frequently proceeds from the fault of those who have the management of them, by suffering the tops to grow too large before they are lopped; and this is common in the ash, elm, hornbeam, &c. It is done in order to have more great wood; but the cutting off great tops often endangers the life of the trees, or wounds them, so that they yearly decay more in their bodies than the annual value of the tops; hence it is to the loss of the owner to have them so managed; and though the hornbeam and elm will bear great tops, when the body is little more than a shell, the ash, when it comes to take wet at the head, and decays, rarely bears any more top. When timber trees of this kind begin to decay, they should be cut down as soon as possible.

But the lopping of trees at ten or twelve years old, in general, preserves them much longer, and occasions the shoots to grow more into wood in one year than they do in old tops in two or three. As great boughs, ill taken off, spoil trees, they should always be taken off close and smooth, and not in a slanting manner, as is a common practice. The wood should be covered with loam and horse-dung mixed, or some of Mr. Forsyth's composition, to prevent the wet from entering the bodies of the trees, and destroying them by bringing on the rot.

When trees are at full growth, the signs of their decay are the withering or dying of many of their top branches, and the wet entering at some knots, or their being otherwise hollow or discoloured; also by their making but poor shoots, and the woodpeckers making holes in them.

The above method of lopping of trees is only, however, proper for pollard-trees; nothing being more injurious to the growth of timber trees than lopping or cutting off great branches from them. Miller observes, that whoever will be at the trouble of trying the experiment upon two trees of equal age and size, growing near each other, by lopping or cutting off the side branches from one of them, and suffering all the branches to grow upon the other, will in a few years find the latter to exceed the former in growth in every way, and not decay nearly so soon.

It is generally recommended not to prune timber trees at all; and, where they naturally grow straight and regular, they are much better let alone. But all common faults in shape may be regulated by lopping them while young, without any ill consequences to the timber.

The very large forest trees should not be lopped at all, except in cases of great necessity, and then only the side branches should be removed, which must be done as close to the trunk as possible. The most proper seasons for the performance of this sort of business are those of the very early autumn and spring months, in most instances.

It may be observed that most sorts of resinous trees, or such

as abound with a milky juice, should be lopped very sparingly, as they are subject to decay when often lopped, or cut over in their branches. The best season for lopping those kinds of trees is the latter end of summer, or beginning of autumn; they then seldom bleed much, and the wounds are commonly healed over before the weather sets in to be bad and severe.

But very few sorts of ornamental trees should be much lopped, as it greatly injures their beauty and appearance. The only thing necessary is to take off such straggling branches as may grow out in an awkward or improper direction, and render them less ornamental. See *Pruning of trees*.

LOPPIS, in *Geography*, a town of Sweden, in the province of Nyland; 36 miles N.N.W. of Helsingfors.

LOPSCHENSKOI, a town of Russia, in the government of Archangel, on the coast of the White sea; 60 miles W. of Archangel.

LORA, a town of Spain, in the province of Seville; eight miles N. of Carmona.—Also, a town of Chili, on a river of the same name, which runs into the Pacific ocean; S. lat. 34° 46'; 105 miles S. of Valparaiso.

LORAH, a town of Hindoostan, in Bahar; 25 miles W.S.W. of Rangoon.

LORANCA, a town of Spain, in New Castile; eight miles S. of Hueta.

LORANGA, a river of Africa, which runs into the straits of Mozambique; S. lat. 17° 30'.

LORANTHUS, in *Botany*, from *lora*, a strap or the rib, and *anthos*, a flower, alluding to the long linear shape, and leathery substance, of the petals. Linn. Gen. 175. Schreb. 233. Willd. Sp. Pl. v. 2. 232. Mart. Mill. Dict. v. 3. Jufl. 212. Lamarck Dict. v. 3. 594. Illustr. t. 258. Jacq. Amer. 97. (Lonicera; Gärtn. t. 27.)—Class and order, *Hexandria Monogynia*. Nat. Ord. *Aggregata*, Linn. *Caprifolia*, Jufl.

Gen. Ch. Cal. Perianth superior, a small, concave, entire rim. Cor. Petals six, oblong, revolute, equal. Stam. Filaments six, awl-shaped, growing at the base of the petals, the length of the corolla; anthers oblong. Pist. Germen inferior, oblong, crowned with the permanent calyx; style simple, as long as the stamens; stigma obtuse. Peric. Berry oblong, of one cell. Seed oblong.

Eff. Ch. Germen inferior. Corolla six-lobed, revolute. Stamens at the tips of the petals. Berry single-seeded.

Obf. *L. europæus* differs from the other species in having dioecious flowers, and *L. paniculatus* in having its flowers five-cleft half way down, with five stamens.

Loranthus consists of paradoxical shrubs, which are chiefly tropical, and many of them extremely beautiful. Linnæus enumerates eleven, in his fourteenth edition of the *Syst. Veg.* and Willdenow has twenty-six, some of which are also noted from Swartz. Lamarck also, as he himself justly asserts, has made us acquainted with several new species not before known, and many have been found since in New Holland, which will doubtless be described by Mr. Brown.—The leaves in the whole genus are opposite, coriaceous or fleshy, and entire, rarely viny. Inflorescence lateral, corymbose, mostly racemose or somewhat corymbose. Petals 6, appearing in an early state, for a long time, and of a pale colour generally red, orange or yellow. The following may serve to illustrate the genus.

L. europæus. Linn. Sp. Pl. 1671. Jacq. Austr. t. 30.—Clusters simple, terminal. Flowers drooping.—Found as a parasite upon oaks, in Austria, Hungary, and Moravia, also, according to Pallas, in Siberia. It bears flowers in April and May, and perfect its fruit in October. See *Syst. Veg.*

very much branched and forked, often four feet long, smooth. Bark brown, thick, tubercled, slightly atrugent, and turning water red in which it has been macerated. Wood whitish and brittle. Leaves oblong, obtuse, entire or emarginate, deciduous when the fruit is ripe. Flowers delicately fragrant, yellowish-green, in some plants altogether barren, in others all of them fertile. Berry of a yellow colour. This plant has much the habit and appearance of our Mistletoe, *Viscum album*, and is very remarkable in its genus for being found in cold climates.

L. tunicoides. Linn. Sp. Pl. 473. (Itti Canni; Rheed. Mal. v. 7. 55. t. 29.)—Flowers in an aggregated head, often pentandrous.—This is a native of groves in Asia.—A very handsome species, whose branches are long and flexuose. Leaves ovate-lanceolate, thickish, entire, smooth, veined, bluntish. Flowers about five in a cluster, sessile, tubular, yellow, downy withinside. Stamens generally five. Fruit round, greenish-yellow, containing a small, white nut, which has a bitter flavour.

L. corymbosus Lamarek Dict. v. 3. 599. (*Lonicera corymbosa*; Linn. Sp. Pl. 249. *Periclymenum foliis acutis, floribus profundè dissectis*; Feuillée Peruv. v. 2. 765. t. 45.)—Corymbs axillary, opposite. Leaves ovate, acute. Flowers quadrangular, with four petals, and four stamens.—Native of Chili, from whence we have a specimen, by favour of Mr. Menzies, which enables us better than Feuillée's figure to understand the species.—The flowers are of a blood red, with yellow stamens. By the last mentioned author's account this seems not to be parasitical. It is used for dyeing a fine black colour.

LORANTHUS, in *Gardening*, comprises a plant of the exotic kind for the stove, of which the species cultivated is, the American loranthus (*L. Americanus*.) Its branches are subdivided, leafy, smooth, pale green, brittle, and the leaves pale with red flowers.

This plant ramps over the highest trees in Jamaica, &c. especially the coccoloba grandifolia, with the root adhering firmly to the bark like mistletoe.

Method of Culture.—This plant may be increased by sowing the seeds, as soon as they are fully ripened, in pots of light rich earth, being kept in a mild hot-bed until the beginning of the autumn, when they must be plunged in the bark hot-bed of the stove, being afterwards treated as other tender plants of the same kind.

It affords variety in stove collections.

LORARI, among the *Romans*, officers whose business it was, with whips and scourges, to compel the gladiators to engage. The lorarii also punished slaves who disobeyed their masters.

LORBUS, or **LERBA**, in *Geography*, a town of Africa, in the country of Tunis, anciently called "Laribus Calonia;" 10 miles W. S. W. of Tubelak.

LORCA, anciently called *Glicrata*, a town of Spain, of considerable size, in Murcia, situated very near the confines of the kingdom of Granada, at the foot of a steep mountain, consisting almost wholly of schist, and denominated the Sierra del Cano, on the right bank of the Guadalentin. It lies at the entrance of a fine rich country, abounding with trees, particularly olive and mulberry, fertilized by the above-mentioned river. The town had formerly a castle advantageously situated on the top of the mountain, which was strong under the Moors and under the kings of Castile; but it is now in ruins. Lorca is now much larger than it was under the Moors, by whom it was taken in 714; it is divided into the upper and lower town, the former being the old part on the declivity of the hill formerly occupied by the Moors, and the latter, which is more modern and

better built, stands altogether on level ground; it has four gates and several squares, and two suburbs, and its extent is sufficient to accommodate 12,000 persons. The population of Lorca is computed at about 30,000 inhabitants, partly noble of ancient families, and devoted to agriculture, and partly very poor: intermixed with the other inhabitants are several wandering vagabonds, called Gitanos or gypsies. Lorca has at present a collegiate chapter, eight parish churches, seven monasteries, two nunneries, two hospitals, one for men and the other for women, and a college for the instruction of youth. It is governed by a corregidor, and twenty-four regidores, who form the principality; it has a manufacture of salt-petre, but has no kind of commerce. Some of the produce of the country is taken from it, particularly silk and kali; but this trade is carried on by foreigners, especially the French, who are settled here. The town suffered much in 1802 by an inundation from a large basin or reservoir, which had been constructed of an immense size in order to water the whole of its adjacent territory. This basin being undermined, the water rushed from it with such impetuosity, that it wholly destroyed one of its suburbs, consisting of about 600 houses, and several public buildings, and extended its destructive ravages to an extent of 16 leagues, so that the number of people who perished was estimated at 6000 and the animals at 24,000. The whole loss was estimated at 200 millions of reals, or about 2,083,333*l*. sterling. Lorca is distant 42 miles W. from Carthagena. N. lat. 37° 38'. W. long. 2°.

LORCH, a town of Germany, the inhabitants of which chiefly subsist by cultivating vineyards and making wine; 24 miles W. N. W. of Mentz.

LORCHAUSEN, a town of Germany, seated on the Rhine; 27 miles W. of Mentz.

LORD, a title of honour attributed to those who are noble, either by birth, or creation; and vested with the dignity of a baron.

The word is of Saxon origin, and primarily denotes a bread-giver, alluding to the hospitality of our ancient nobles: it is formed, according to Camden, from *blaford*, afterwards written *lford*; a compound of *blaf*, bread, and *furd*, to supply, afford.

In this sense, lord amounts to the same with peer of the realm, lord of parliament.

LORD is also applied to those so called by the courtesy of England; as all sons of a duke or marquis, and the eldest son of an earl.

LORD is also an appellation given to divers persons honourable by office; as lord chief justice, lord chancellor, lord of the treasury, admiralty, &c.

LORD is also a title sometimes given to an inferior person who has a fee, and consequently the homage of tenants within his manor.

For by his tenants he is called *lord*, and in some places, for distinction sake, *land-lord*.

It is in this last signification that the word lord is principally used in our law-books, where it is divided into *lord paramount*, and *lord mesne*.

LORD MESNE, is he that is owner of a manor, and by virtue thereof hath tenants holding of him in fee, and by copy of court-roll; and yet holds himself of a superior lord called *lord paramount*.

We also read of *very lord*, and *very tenant*.

LORD IN GRASS, he who is lord, not by reason of any manor, as the king in respect of his crown, &c.

VERY LORD, is he who is immediate lord to his tenants; and **VERY TENANT**, he who holds immediately of that lord.

So that where there is lord paramount, lord mesne, and tenant; the lord paramount is not very lord to the tenant.

LORD High-Admiral of England, is one of the great officers of the crown, whose trust and honour is so great, that it was formerly seldom given, except to some of the king's youngest sons or near kinsmen.

To him is, by the king, entrusted the management of all maritime affairs, as well in respect to jurisdiction as protection; with the government of the British navy; and a power to decide all controversies and causes maritime, as well civil as criminal; such as happen either on our coasts, or beyond sea, among his majesty's subjects.

To him also belong such wrecks and prizes, as are called *lagon, jeyson, and flishon*; that is, goods lying in the sea, floating, or cast ashore, excepting in such royalties as are granted to other lords of manors, &c. with all great fishes, called *royal fish*, except whales and sturgeon; a share of prizes in the time of war, and the goods of pirates and felons condemned.

The lord high-admiral has under him many officers of high and low condition; some at sea, others at land; some of a military, others of a civil capacity; some judicial, others ministerial.

This great office is now usually executed by seven commissioners, who are styled *lords of the admiralty*: one is called the first lord, with a salary of 3000*l.* a-year, the others have 1000*l.* a-year each. Under these there are a secretary and deputy-secretary, and several inferior clerks. See *Lord High Admiral of England*.

In the court, called the *court of admiralty*, all processes issue in his name, not the king's, as they do in all other courts; so that the dominion and jurisdiction of the sea may justly be styled another commonwealth or kingdom apart, and the lord high admiral the viceroy of the maritime kingdom.

He hath under him a lieutenant, or deputy, who is judge of the admiralty, commonly a doctor of the civil law. See *Court of Admiralty*.

LORD Privy-seal has his office by patent: before the 30th of Henry VIII. he was generally an ecclesiastic; since which, the office has been usually conferred on temporal peers, above the degree of barons.

The lord privy-seal, receiving a warrant from the signet-office, issues the privy-seal, which is an authority to the lord chancellor to pass the great seal where the nature of the grant requires the *Seal*; which see. But the privy-seals for money begin in the treasury, from whence the first warrant issues, counter-signed by the lord treasurer. On the lord privy-seal are attendant four clerks, who have two deputies to act for them.

LORD Steward of the King's Household, is the principal officer for the civil government of the king's servants below stairs; over the officers of which he has jurisdiction. See *Household*.

He is constituted by the delivery of the white staff, which is emblem of his commission. By virtue of his office, without any other commission, he judges of all offences committed within the court, or the verge thereof; and he is empowered according to their several delinquencies. See *Court of Chivalry*.

At the death of the sovereign he presides in the Tower, the place in which the royal corpse is deposited, and thence carries off all the officers under his power.

See *Advocate*.

LORD High-Treasurer. See *TREASURER* and *TREASURY*.

LORD Chamberlain of the Household. See *CHAMBERLAIN*.
LORD Great Chamberlain of England. See *CHAMBERLAIN* and *HOUSEHOLD*.

LORD High Chancellor of England. See *CHANCELLOR*, and *COURT of Chancery*.

LORDS of the Bedchamber, are fourteen in number, under the lord chamberlain. See *BED-CHAMBERLAIN*, and *HOT-SHOLD*.

LORDS of the Seal. See *PEERS*.

LORDS of Session. See *SESSION*.

LORDS of the Treasury. See *TREASURY*.

LORDS Lieutenants of Counties, are officers of great distinction appointed by the king for the management of the military militia of the county, and all military matters therein. They are supposed to have been introduced about the reign of king Henry VIII., for they are mentioned as known officers in the statute 4 and 5 Ph. & M. c. 3, though they had not been then long in use; for Camden speaks of them, in the time of queen Elizabeth, as extraordinary magistrates constituted only in times of difficulty and danger.

They are generally of the principal gentry, and of the best interest in the county: they are to command militia in case of a rebellion, &c. and march at the head of them, as the king shall direct.

They have the power of commissioning colonels, majors, captains, and subaltern officers; also to present the king with the names of deputy-lieutenants, who are to be selected from the best gentry in the county, and act in the absence of the lord-lieutenants.

Subservient to the lord lieutenants and deputy-lieutenants, are the justices of peace: who, according to the order they receive from them, are to issue out warrants to the high and petty-constables, &c. for military service, &c.

LORD'S DAY. See *SUNDAY*.

LORD Howe's Group, in *Geography*, a cluster of islands in the Pacific ocean, discovered by captain Hunter in the year 1791. Thirty-two of these islands were distinctly counted from the mast-head, and they lay at such a distance, as to afford reason for supposing that they were more numerous. Some of the natives, who appeared in a boat, were clean, stout, well-formed persons of a burly appearance; their hair was tied in a knot at the back of the head, and they seemed to have some method of taking on their beads, of which they were debilitate; but they were inconstant, consisting of a number of rings, like a tooth in the beard, which was taken on between the nose and mouth, to which hung a row of teeth, so that they appeared as if they had a fictitious mouth lower than their natural one; they had a complexion of red, or bone, thrust forth in the fleshy of the face, and passing through the features; their persons were clothed in some tattooed, and some were painted with red and white clay; and their middle was covered with a net-work of scars, which was fully extended, and had many scars, and was about forty feet in length. The islands were covered with a very thickly covered with wood, among which the cocopal was very distinguishable. S. lat. 5° 30' N. long. 159° 20'.

LORDONIS, from *London*, a town of the kingdom of England, in the province of Kent, situated on the N.E. of London.

LORD, in *Geography*, a term of the rank quality of *Gen.*, in the province of England, and the N.E. of London.

LORDO, or *Londra*, a city of Italy, in the Venetian Dominions, and one of the principal places of a dukedom, and

and contains about 2300 inhabitants; 25 miles S. of Venice.

LOREMBERG, a town of the county of Goritz; 7 miles E. of Goritz.

LORENTE, ANDRES, in *Biography*, a Spanish writer in music, and author of a book, now become very scarce, intitled "El porque del la Musica," in which are contained the four arts of plain-song, figurative music, or proportion of time or measure, plain counterpoint, and compositions. Printed at Alcalá in 4to. 1672.

This is truly a very ancient treatise, which defines and explains the whole art of music, as far as it was known at the time it was written. See WORGAN, *Dr.*

LORENTZ, in *Geography*, a town of Prussia, in Samland, near the Baltic; 24 miles N.W. of Königsberg.

LORENTZEN, ST., a town of the duchy of Stiria; 8 miles N.E. of Windisch Gratz.

LORENZAGO, a town of Italy, in the Cadurin; 7 miles N.E. of Cadore.

LORENZINI, FRANCIS MARIA, in *Biography*, an eminent Italian poet, was born at Rome in 1680. He was educated among the Jesuits, and in his twenty-second year was received into their society, but quitted it again within a few months, on account of ill-health. He was much attached to literature; but he was obliged, by the scantiness of his means, to apply to some profession for his necessary maintenance. He engaged in that of the law, which he practised with success for a short period, after which he devoted himself entirely to letters. He entered into the academy of the Arcadi, the chief object of which was the reformation of the bad taste which had infected Italian poetry. The founders of this society proposed the style of Petrarch as a model, in opposition to the affected and contrained diction of Marino and others. Lorenzini did not quite approve the method of Petrarch, but borrowed some of the force of freedom of Dante, and thus excelled his contemporaries. He is said also to have excelled in melodramas, or pieces on religious subjects, adapted to being sung, written in the Latin language. In the contest between Crescimbeni and Gravina, which divided the members into two parties, Lorenzini adhered to that of Gravina, which was the minority; he would not, however, agree to the proposal to found a new academy, and after a succession of three years, he was admitted among the old Arcadi. He was now, from an inattention to his domestic concerns, fallen into a state of indigence, and, as evils rarely come singly, he had suffered much from some calumnious reports. Being obliged, on this latter account, to appear before the prefect of the city, he so completely justified himself, that this magistrate, Falconeri, to shew the estimation in which the poet was held by himself, gave him a place in his household. He now felt himself elevated above the misfortunes of life, and with a fine flow of spirits spent a part of every day in writing verses. In these he displayed an enthusiasm of conception, and a loftiness of language, which distinguished him among his contemporaries. He has been denominated the Michael Angelo of Italian poets, on account of the boldness and energy of his expressions. To excite wonder and admiration, he considered as the peculiar office of poetry, whence he became an enthusiastic admirer, and almost perpetual reader of the Hebrew poets, which never failed to inspire him with rapture. He had a great passion for the science of anatomy, and had made, in conjunction with an eminent surgeon at Rome, some new observations, which they meant to have published as the result of their united labours, but which were surreptitiously stolen from them. In 1728,

Lorenzini was chosen president of the academy, and shewed his fitness for the office by several remarkable acts. He founded five academical colonies in the neighbouring towns, and instituted a private weekly meeting of the Arcadi, at which the plays of Plautus or Terence, in the original language, were performed by youths trained for the purpose. These exhibitions were frequented by several persons of rank, and were favoured by Pope Clement XII., who often sent considerable sums to Lorenzini to defray his expences. Being deprived by death of his friend Falconeri, his circumstances were again deranged, and he was relieved, in this instance, by cardinal Borghese, who enrolled him among his noble domestics, and paid him liberally without requiring any service. In 1741, he discontinued his theatrical exhibitions, retired to apartments in the Borghese palace, where he applied to letters with more assiduity than ever. He wrote much Latin and Italian poetry; but his chief studies were directed to the sacred writings. In the midst of his employments, he died in June 1743. He was faithful and liberal, and his house was open to young men who were desirous of improvement. His Italian poems are few, but of great excellence. He published the lives of two of the Falconeri family. Gen. Biog.

LORENZO, in *Geography*, a small island in the Pacific ocean, near the coast of Peru. S. lat. 12° 4'.

LORENZO, ST., a town of Istria, and capital of a district; 9 miles N.N.E. of Rovigno. N. lat. 45° 16'. E. long. 13° 52'.

Lorenzo de Borucas, a town of Mexico, in the province of Colla Rica; 65 miles S. of Carthago. N. lat. 9° 15'. W. long. 84° 6'.

LORENZO, ST., a town of South America, in Brazil, and government of Pernambuco.—Also, a town of Naples, in Basilicata; 9 miles N.E. of Venosa.—Also, a town of Naples, in Capitanata; 3 miles S.E. of Lefina.—Also, a town of Naples, in Calabria Ultra; 8 miles W. of Bova.—Also, a town of Campagna di Roma, near the sea-coast; 8 miles E.S.E. of Ostia.—Also, a town of Paraguay; 270 miles S.E. of Assumption.—Also, a river of Sicily, which runs into the sea, on the W. coast, N. lat. 38°. E. long. 12° 40'.—Also, a town of Mexico, in the province of New Biscay; 85 miles N.W. of Parral.—Also, a town of Italy, in the Polesine di Rovigo; 2 miles S.W. of Rovigo.

LORENZO de Pecurios, ST., a town of New Mexico, on the Bravo; 45 miles N. of Santa Fé.

LORENZO el Real, ST., a town of Spain, in Old Castile; 26 miles S. of Segovia.

LORENZO, Cape ST., a cape on the coast of Peru, in the province of Quito, W. of the city of that name. S. lat. 0° 20'. W. long. 80° 20'.

LORETI, IL CAVALIER VITTORIO, in *Biography*, according to Adami, was a soprano singer in the papal chapel, 1622; one of the first evirati employed in musical dramas on the stage, at the beginning of operas; and a celebrated composer of *ARIB a Cantate da Camera*; which see.

LORETTO, in *Geography*, a small, indifferently built, walled town and bishop's see, in the marquisate of Ancona, in Italy, consisting chiefly of one street within the walls, and another without as a suburb, containing 7000 inhabitants, pleasantly situated on an eminence, 3 miles from the sea-shore, 17 S. of Ancona, and 160½ N.E. of Rome. It is principally famous for the holy house, or *CASA Santa*; which see.

LORETTO, a small village of Christian Indians, 3 leagues N.E. of Quebec, in Lower Canada; deriving its name from a chapel,

a chapel, built according to the model of the Santa Casa at Loretto in Italy; from whence a image of the holy Virgin has been sent to the converts here, similar to that in the famous Italian sanctuary. These converts are of the Huron tribe.

LORETTO, *Lady of*, a place in the district of St. Dennis, on the isthmus of California, called by the Indians "Cancho;" in which is a small fort, erected by the missionaries, consisting of 10 or 12 bastions, and surrounded by a deep ditch. In this jurisdiction are fifteen parishes, including 4000 professing Indian, under the instruction of Dominican friars.

LORETTO, or *Loreto*, a town of the island of Corfica; 7 miles N.E. of Porto.—Also, a town of New Mexico, in the province of Mayo; 105 miles E.N.E. of Santa Cruz.—Also, a town of South America, in the province of Buenos Ayres; 200 miles E. of Corrientes.—Also, a town of South America, in the government of Majos, on the Mar-mara; 50 miles S. of Trinidad.

LORETTO, *Order of*, in *Heraldry*, an order of knight-hood, instituted by pope Sixtus V. in 1587, confirmed by pope Paul III., and abolished by pope Gregory XIII. The knights wore, pendent to a ribbon at their button-hole, a small gold medalion, enamelled with the image of the virgin of Loretto.

LOGUES, in *Geography*, a town of France, in the department of the Var, and chief place of a canton, in the district of Draguignan; 6 miles S.W. of Draguignan. The place contains 4023, and the canton 10 520 inhabitants, on a territory of 502, kilometres, in 6 communes.

LORI, in *Ornithology*. See *Psittacus Amboinensis*.

LORICARIA, in *Natural History*, a genus of fishes of the order abdominalis. The generic character is, head smooth, depressed; mouth without teeth, retractile; gill-membrane six-rayed; body mailed, hence its name. According to Gmelin, there are but two species; but Dr. Shaw describes seven, which we shall enumerate in their order.

Species.

COSTATA: Ribbed loricaria. Yellowish-brown, mailed by a single row of shields on each side, with a *forked* tail. This fish, in its general habit, resembles a species of the silurus, the mouth being furnished with long cirri, and the first rays of the dorsal and pectoral fins serrated: the head is large, depressed, covered with a rough bony shield, projecting on each side the thorax into an exceedingly strong and obtusely pointed spine of considerable length: the whole body, from the thorax, is strongly mailed along each side by a continued series of very broad bony plates or scales, each of which projects in the middle into a short hooked spine or curved process: the upper and under parts of the body, from the small dorsal fin to the tail, are mailed in the same manner, but with smaller plates than on the sides; the tail is large and sharply forked. It is a native of the Indian and American seas; is a fish of great boldness, and is dreaded by fishermen; the strength and sharpness of its spines enabling it to inflict very painful, and even dangerous wounds.

CATAPHRACTA: Armed loricaria. Brown, mailed by a single row of shields on each side, with a *rounded* tail. This species is nearly allied to the preceding, but differs in having a rounded tail, and in some other particulars. It is about ten inches long, and is found in the American seas.

CALlichthys: Soldier loricaria. Brown, with depressed, rounded head, double row of scales on each side, and rounded tail. This remarkable species grows to the length of ten or twelve inches, and is of a dusky brown

colour throughout, with a tinge of reddish or yellowish-brown on the fins and under parts. It is highly esteemed as an article of food by the inhabitants of Surinam. It has been asserted, and Dr. Shaw has given currency to the report, probably without attaching any credit to it, that this fish, when distressed for want of water, by the streams which it inhabits being too shallow for it, contrives to make its way over land, in order to discover some deep stream; and occasionally perforates the ground for the same purpose.

PUNCTATA: Speckled loricaria. Yellow, with brownish back; double row of scales on each side; fins speckled with black, and forked tail. A small, but elegant species. Length five or six inches; shape like the generality of fishes. Native of the rivers of Surinam.

ACCIPENSER: Sturgeon loricaria. Yellowish-brown, with toothless mouth, rounded front, and spotted fins. This, as its name imports, is something like a sturgeon, and long and slender. It is a native of the Indian seas, and grows to the length of twelve or fifteen inches. This species is described by Bloch as *L. dentibus carens*.

DENTATA: Toothed loricaria. Yellowish-brown, with toothed, serrated mouth, and slightly pointed front. This differs from the last, in having the mouth furnished with teeth, and in having a slightly pointed snout. It is a native of the Indian seas.

FLAVA: Yellow loricaria. Yellow, spotted with brown, with two dorsal fins and tail marked by transverse bands. This is an elegant species, in length about ten inches; habit much more slender than in the two preceding. Inhabits the Indian seas.

LORICATION, or **COATING**, in *Chemistry*, is the covering of a glass or earthen vessel with a coat or crust of a matter able to resist the fire, to prevent its breaking in the performing of an operation that requires great violence of fire.

When vessels are exposed to a fire too strong for their structure, or to the corrosive quality contained in them, or on the throwing on of fresh cold fuel into the fire where they stand, it frequently happens that they crack and burst; for the preventing of which, the operator has recourse to this method of coating or lorication his vessels. It is performed in the following manner: take a quantity of washed clay, with an admixture of pure sand, powder of calcined flints, or broken crucibles; and instead of pure water, moisten it with fresh blood that has not yet been coagulated, diluted with twice or three times its quantity of water; make the clay with this into a thin paste, and work into it some cow's hair, or other hair not too long nor too stiff, and a little powdered and sifted glass, if you have it at hand; smear over the vessel intended to be used with this paste, by means of a pencil, and let it to dry; when dry, besmear it again, and repeat the operation till the vessel have a crust of a third, or a quarter of an inch, at least, thick of this matter, and let it be thoroughly dry before it is used.

To keep blood in a proper state for this use, it must, when just let out from the animal, be well stirred about with a stick for some time, at least till it is quite cold; and being thus prepared, it will keep for some days without coagulating, and fit for use.

This composition, with an admixture of bole, worked into a paste with the whites of eggs, diluted with water, makes also the proper lute for closing the junctures of other chemical vessels, in the distilling strong spirits. See **LUTE**.

LORIMERS, one of the companies of London, that make bits for bridles, spurs, and such like small iron ware. They

They are mentioned Bar. 1 Rich. II. cap. 12. See COMBANY.

The word seems derived from the Latin, *lerron*, a thong.

LORIOLE, in *Geography*, a town of France, in the department of the Drôme, capital of a canton, in the district of Valence; 12 m. S. of Valence. The place contains 2272, and there are 1000 inhabitants, on a territory of 177 km. sq. (177,000 a.)

LORION, in *Ornithology*, see OULES *Gallinule*.

LORIPES, the name used by the author for the himantopus, a bird of the water-fowl, remarkable for the length and weakness of its legs. See CHARADRIUS *Himantopus*.

LORIS, in *Zoology*, a species of lemur in the Linnæan system, being the Lemur tachiro of Buffon, described by Buffon. See LEMUR *Tachiro*.

LORRAINE, PIERRE DE, in *Biography*, an eminent French architect, was born at Lyons in the early part of the sixteenth century. He went to Italy, when he was but fourteen years of age, to study the art for which he seemed to have a fort of natural taste. His talents attracted the notice of cardinal Cervino, afterwards pope Marcellus II., who took him into his palace, and assisted him in his pursuits. He returned to France in 1570, and was the means of banishing the Gothic taste in buildings, and substituting in its place the Grecian. He was employed by Henry II., for whom he planned the herculean at Fontainebleau, and the chateau of Anet and London. After the death of the king, he was made inspector of the royal buildings by Catherine de Medici; and under her direction he repaired and augmented several of the royal edifices, and began the building of the Thuilleries. In 1577 he was created counsellor and chamberlain ordinary to the king; and as a recompence for his services, he was presented with two abbacies. These honours, it is said, made him arrogant, which occasioned the poet Ronfard to satirize him in a piece, entitled "La Truelle Croisée," or "The croziered Trowel." De Lorraine took his revenge, and shut the garden of the Thuilleries against him; but the queen took part with the poet, and severely reprimanded the reverend architect. De Lorraine died in 1577. He published "Dix Livres d'Architecture," and "Nouvelles Inventions pour bien bâtir et peindre l'Edifice." Merisi.

LORRAINE, in *Geography*, a town of France, and seat of a bailliage, in the department of the Nièvre; 33 miles N.E. of Nevers.

LORNA, a district of Scotland, in the north part of the county of Angus, where the residence of the duke of Argyll, who is lord of the marquis of Lorna.

LOROMUS, a river, and seat of a parish, in the state of Ohio, within the border of Kentucky, and near a fort of a branch of the great Miami river, which falls into the Ohio. At this fort, born & lived by the Indian line, the Indians called a tract of land to the United States, six miles square, being now called Argosy, 1804. Here the postage came from between the Mouth of the Ohio and St. Mary's river, and was called like this.

LORON, a town of Tunis, anciently called "Larion," in the S.W. of Tunis.

LORON, in *Geography*, a town of France, in the department of the Maine and Loire; 13 miles W.N.W. of Angers.

LORON, in *Geography*, a town of France, in the department of the Maine and Loire, capital of a canton, remarkable for its situation, 15 miles S. of Angers. The place contains 1772, and there are 8700 inhabitants, on a territory of 177 km. sq. (177,000 a.)

LORQUI, a town of Spain, in Murcia; 12 mil S.W. of Murcia.

LORRACH, or LARACH, a town of the duchy of Baden; 6 miles N.E. of Bâle.

LORRAIN, ROBERT DE, in *Biography*, an eminent sculptor, was born at Paris in 1666. He was pupil of Goussier, who confided to him, at the age of eighteen, the instruction of his own children, and the correction of the designs of his other pupils. Having distinguished himself by several works, and carried away the first prize at the académie, he went to Rome for improvement. In 1693 he returned; but owing to the misfortunes of the times, he found scarcely any employment. In 1701 he was admitted into the academy of painting and sculpture, on account of his great merits as an artist. He was perfectly unanimous in his manner, and took a head of putting himself forward; so that his works, which always attracted notice, were much more known than his person. In 1710 he was nominated a joint professor in the academy; and in 1717 he filled the office of professor. The duties of these offices he fulfilled with great attention; and he could boast of having instructed in his art several pupils of extraordinary merit. He executed much of the exterior sculpture of the palace of Savoy near Strasbourg, for the cardinal de Rohan; but in the midst of his labours, and of an increasing reputation, he was attacked by a stroke of apoplexy in 1728, which obliged him to return to Paris, where he lingered several years, till death terminated his afflictions in 1743. Lorrain was distinguished by his character-heads; of which, those of young persons, particularly of the female sex, are often exquisitely beautiful, with airs of singular grace and elegance. Gen. Biog.

LORRAINE, *Duchy of*, in *Geography*, united to France, and, together with the duchy of Bar, now divided into the departments of the Meuse, the Meurthe, the Moselle, and the Vosges; which see respectively. This country forms only a small part of a kingdom, which bore that name, and which extended from Vienna on the Rhône to Cologne. Separated from Bar, it is about 99 miles in length, and 60 in breadth. The principal rivers are the Meuse, the Moselle, the Meurthe, and the Saar.

According to Chaucer, we know not on what foundation, Lorrain abounded in singers superior to those of France:

"There mightest thou see these flowers,
Nicolles, and eke fullars,
That well to fingring did their pain,
Some fongers fonge of Lorraine;
For in Lorraine their notes be
Put sweeter than in this countree."

LORRAINE, CHARLES DE, in *Biography*, cardinal and archbishop of Rheims, younger son of Charles de Guise, first duke of Guise, was born in 1545. He was created archbishop of Rheims, at the age of nineteen, in 1564, and cardinal by pope Paul III. in 1567. At the death of his uncle, the cardinal John of Guise, in 1572, he succeeded to a rich course of benefices, which, altogether, amounted in the whole to two archbishoprics, six bishoprics, and several rich abbeys. In addition to this, he possessed a fine person, quick perceptions, and a fluency of language, and no inconsiderable share of learning. Through the interest of Diane de Poitiers, mistress of Henry II., he was sent out as his ambassador to the pope. He soon entered into the views of the holy party, and persuaded the king his master to undertake a war for the conquest of Naples, in which his brother, the duke of Guise, had the

principal command. He was a bitter enemy to the reformers of the age, and promoted several severe and cruel edicts against them. He made the utmost efforts in his power to introduce into his own country the infernal inquisition; a point which he would probably have carried, but for the opposition of the excellent chancellor de l'Hopital, seconded by the good sense and temper of the people. During the short reign of Francis II. the cardinal usurped and maintained a most despotic authority: but he was equally zealous for his own fame as he was for the honour of the Catholic religion. At the conference of Poissy between the two religious parties, he gained some reputation, at least with those who felt it their interest to flatter him, by his eloquence in refuting the learned Beza; but it was not very difficult to confound the antagonist, who had truth and not power on his side, and whose reasoning was treated as blasphemy. The cardinal was likewise ambitious of the praise of pulpit eloquence, and preached several times at Paris before large audiences; and the violence of his discourses against the Protestants led the people to regard him as one of the principal authors of the furious civil wars under Charles IX., crowned by the horrid massacre of St. Bartholomew's. He was remarkably fond of show, and appeared with splendour at the council of Trent; at which, it is reported, Pius V., who denominated him "the little pope beyond the mountains," did not wish for his presence. The death of his brother, the duke, diminished his consequence; and he found it necessary to relax in the vigour with which he began in maintaining the interests of the Gallican church. During the reign of Charles IX. he was the minister of state, and also ambassador to the court of Spain. On the accession of Henry III. he went to meet that prince at Avignon, on his way from Poland; and, in a religious procession, placed himself at the head of the "blue penitents." This was the last show in which he figured, being at the time seized with a fever, which terminated his life in December 1754, in the fiftieth year of his age. It is difficult to draw the character of this cardinal. His enmity to the Protestants caused him to be the object of much party satire and reproach. They probably exaggerated his failings and immoralities: but making due allowance for the effect of private enmities, still it must be admitted he was a man of exceedingly licentious habits, and who expected, perhaps, to bury his faults by his zeal for the church, or by an excess of ostentatious alms-giving. "He was accustomed," says one of his biographers, "to carry a great leathern purse, which his valet-de-chambre took care to fill every morning with three or four hundred crowns; and as many poor as he met, he put his hand into his purse, and gave them a handful of money without counting. But if he were prodigal in his alms, he was not less so in gifts to other persons, and especially to the ladies, whose favours he readily procured by this bait; and it was asserted that there were very few, married or single, frequenting the court at that time, who were not debauched by the largesses of the cardinal." By Maimbourg it is asserted, that the cardinal was the boldest of men in forming mighty schemes in his closet, but the weakest and most timid when they were put into execution. He was venerated by the clergy as the guardian of their immunities; by the Catholics in general, as the champion of their faith. Versed in the wiles of courts, fruitful in expedients, and eloquent in debate, he was too readily elated by success, and too easily depressed by defeat. His personal courage was ever a subject of doubt; his vindictive temper was at all times dreaded; and the dissolute pleasures of his private vied with the presumption of his public conduct.

VOL. XXI.

tion of his public conduct. Some of his literary compositions have been printed: they consist chiefly of harangues on public occasions. History of France, London, 1790. Bayle. Moreri.

LORRES, in *Geography*, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Fontainebleau. The place contains 610, and the canton 9193 inhabitants, on a territory of 257½ kilometres, in 18 communes.

LORRIS, WILLIAM DE, in *Biography*, a French poet, who flourished about the middle of the thirteenth century, is known as the author of the "Roman de la Rose," a poem much in request in the middle ages. Under the allegory of a rose-tree, planted in a delicious garden, and protected by bulwarks, it describes a lover's pursuit, and final acquisition of the object of his passion. He did not live to finish his work: it was completed in the next century by John de Meun. The part by Lorris, though the shortest, is by much the most poetical, abounding in rich and elegant description, and in lively portraiture of allegorical personages. The best edition of this poem is that of the Abbé de Lenglet, three vols. 12mo. 1735. Chaucer translated that part which belonged to Lorris. Gen. Biog.

LORRIS, in *Geography*, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Montargis; 12 miles S.W. of Montargis. The place contains 1526, and the canton 6528 inhabitants, on a territory of 205 kilometres, in 13 communes.

LORRY, ANNE-CHARLES, in *Biography*, a learned physician, was born at Croissy, near Paris, in 1725. He studied and practised his profession with unremitting zeal and peculiar modesty, and obtained a high reputation. In 1748 he was admitted doctor of the faculty of medicine at Paris, and subsequently became doctor-regent of the faculty. He was author of several works, some of which still maintain their value. His first publication was entitled "Essai sur l'Usage des Alimens, pour servir de Commentaire aux livres diététiques d'Hippocrate," Paris, 1753, 12mo.; the second part of which appeared in 1757. His next publication was an edition of the Aphorisms of Hippocrates, Greek and Latin, in 1759. Afterwards he produced a treatise "De Melancholia et Morbis Melancholicis," ibid. 1765, in two volumes 8vo. and edited Dr. Astruc's "Memoires pour servir à l'Histoire de la Faculté de Médecine de Montpellier," ibid. 1767, 4to.; and "Sanctorii de Medicina Statica," with a commentary, 1770, in 12mo. His last work, which combined the merits of much erudition and accurate observation, with great clearness of arrangement and perspicuity of language, was "Tractatus de Morbis Cutaneis," Paris, 1777, in 4to. Dr. Lorry also edited a Latin edition of the works of Mead, and a French one of Barker's dissertation on the conformity of the doctrines of ancient and modern medicine. He died at the baths of Bourbonne, in 1783. Eloy Dict. Hist. de la Med. Gen. Biog.

LORSQUEN, in *Geography*, a town of France, in the department of the Meurthe, and chief place of a canton, in the district of Sarrebourg; four miles S.S.E. of Sarrebourg. The place contains 1164, and the canton 13,680 inhabitants, on a territory of 390 kilometres, in 29 communes.

LORUNGAH, a pass in the mountains of Bengal; 18 miles W. of Ramgur.

LORY, in *Ornithology*. See PSITTACUS *Garrulus*, &c.

LOS REYES. See LIMA.—Also, the chief town of the province of Uragua, in the east division of Paraguay, in South America.

Los Charcos, a province in the southern division of Peru, the chief cities of which are Put si and Porco.

LOSARI, a town of the island of Corsica; 15 miles N. of Calvi.

LOSDORF, a town of Bohemia, in the circle of Leitmeritz; six miles W.S.W. of Kamnitz.

LOSENITZA, a town of European Turkey, in Servia; 30 miles S.S.W. of Sabacz.

LOSER, a town of the electorate of Salzburg, on the Stampach; 21 miles S.W. of Salzburg.

LOSTIZ, a town of Naples, in the province of Bari; six miles E. of Bitetto.

LOSORCA, Sr., a town of the island of Sardinia; 11 miles S. of Basti.

LOSQUET, a small island in the English channel, near the coast of France. N. lat. $43^{\circ} 49'$. W. long. $3^{\circ} 31'$.

LOSS, *Islands of*, a cluster of small islands in the Atlantic, near the coast of Africa. N. lat. $9^{\circ} 16'$. W. long. 13° .

LOSSA, a town of Silesia, in the principality of Brieg; five miles S.E. of Brieg.

LOSSAU, a town of Germany, in the principality of Bayreuth; nine miles S.E. of Bayreuth.

LOSSIEMOUTH, a seaport town of Scotland, in the county of Murray, at the mouth of the river Lossie, famous for its trout. A few fishing vessels belong to the place; but its harbour is convenient for vessels of 50 tons; six, miles N. of Elgin.

LOSSIN, or **LASSIN**, *Great*, a town in the S. part of the island of Cherbo, containing about 1800 inhabitants.

LOSSIN, *Little*, a town of the same island, containing about 1600 inhabitants; one mile S. of Great Lossin.

LOSSIUS, **LUCAS**, in *Biography*, of Lunenburg, a Lutheran divine and school-master, well skilled in music, who published at Nuremberg, in 1553, "*Erotomata Musicæ practicæ*," and Lutheran psalmodia. At the time of the Reformation the Lutherans preserved more music in their liturgy than the Calvinists, or the church of England.

LOSSNITZ, in *Geography*, a town of Saxony, in the lordship of Schönbürg; 50 miles E. of Dresden. N. lat. $50^{\circ} 32'$. E. long. $12^{\circ} 37'$.

LOSTORFF, a town of Austria; nine miles W. of St. Pölten.

LOSTWITHIEL, a borough, market-town, and parish in the hundred of Powder, and county of Cornwall, England, is situated in a narrow valley on the western side of the river Fawy, 25 miles distant from Launceston, and 234 from London. The houses are principally disposed in two streets, running parallel from the river to the bottom of a steep hill, which rises to a great height on the west. The buildings are chiefly of stone, and covered with slate, which is obtained in great abundance in the vicinity of the town. The church consists of one large and two small aisles, with a tower at the west end, terminating in a singular open spire. The font is constructed of a large octangular block of free-stone, supported by five clustered columns, charged with rude and ill-executed sculptures. In the south aisle is an ancient monument of the time of Elizabeth, with eight small figures, in basso-relievo, kneeling, erected in memory of Temperance, wife of William Kendall, esq. who died in 1579. At a small distance to the south of the church are the external walls of an old building called the palace, which was anciently a residence of the dukes of Cornwall, but is now converted into the stannary prison. This fabric was once very extensive; but great part of its site is occupied by timber yards. The walls are extremely thick, and, like

many ancient castles, seem to have been constructed with small stones, fixed by a liquid cement, now become harder than the stone itself. Lostwithiel was incorporated at a very early period; numerous privileges were conferred on it by Richard, king of the Romans, who, by charter, made it a free burg, and granted to its burgesses the liberty of a guild mercatory. They also possess the anchorage due of Fawy harbour, and various duties on coal, salt, corn, malt, and other commodities brought into that port. The corporation consists of a mayor, six burgesses, and seventeen assistants, or common councilmen, who are chosen annually by the mayor and burgesses. The borough has returned two members to parliament ever since the 23d of Edward I.: the right of election is confined to the corporation. This was anciently the shire town; and the county members are still elected here, and the county weights and measures kept here. According to the enumeration made in the year 1801, this town contained 125 houses, and 743 inhabitants. A market is held on Friday, and three fairs annually.

About one mile north of Lostwithiel, on the summit of a very high hill, are the mouldering remains of Restormel castle, a fortress magnificent in ruin, and proudly exalting its ivy-clad walls above the contiguous narrow winding vallies. This was one of the principal residences of the earls of Cornwall: Richard, king of the Romans, kept his court here; his son Edmund also made this castle his abode; and though now in decay, yet the grandeur of its ruins, and the importance they communicate to the surrounding scenery, render it peculiarly interesting. The castle and its honour were part of the inheritance of the dukes and earls of Cornwall; and were annexed by Edward III. to the duchy; but the mansion formerly connected with the estate, and named the Trinity-house, is now the property of the earl of Mount Edgecumbe, and called Restormel. *Beauties of England and Wales*, vol. ii.

LOSZLAU, or **WODISLAU**, a town of Silesia, and chief place of a lordship, in the principality of Ratibor; 11 miles S.E. of Ratibor. N. lat. $49^{\circ} 57'$. E. long. $18^{\circ} 18'$.

LOT, so called from the river, which rises in the department of the Lozère, and joins the Garonne, near Aiguillon, formerly *Quercy*, one of the nine departments of the southern region of France, lying in $44^{\circ} 30'$ N. lat., N.N.W. of Tarn, and equidistant from both seas; bounded on the N. by the department of the Corrèze, on the E. by the Cantal, on the S.E. by the Aveyron, on the S. by the Tarn and the Upper Garonne, on the W. by the Lot and Garonne, and on the N.W. by the Dordogne; 34 French leagues in length and 50 in breadth, containing 74321 kilio-metres, or 302 square leagues, and 383,083 inhabitants. It is divided into four circles or districts. 41 cantons, and 440 communes. The circles are Montauban, including 115 954, Figeac, 80,372, Gourdon, 75,861, and Cahors, 111,406 inhabitants. The capital of the department is Cahors. Its contributions amount to 3,235 544 fr. and its expences to 272,533 fr. 33 cents. This department is, in general, hilly, but contains some fruitful plains and vallies. Its products are grain, wine of an excellent quality, fruits, silk, hemp, flax, tobacco, and pastures. It has iron mines, coal, and mineral springs.

LOT and Garonne, formerly *Agénais*, one of the nine departments of the fourth-west, or Garonne region of France, lying in $44^{\circ} 30'$ N. lat. and bounded on the N. by the department of the Dordogne, on the E. by the Lot, on the S. by the Gers, and on the W. by the Landes and Gironde, 23 French leagues in length and 18 in breadth, containing

6100 kilometres, or 36,308 square leagues, and 352 008 inhabitants. It is divided into four circles, 38 cantons, and 459 communes. The circles are Agen, including 107,840, Marmande, 112,091, Nerac, 43,119, and Villeneuve d'Agen, 89 858 inhabitants. Its contributions amount to 3,807,413 fr. and its expenses to 202,739 fr. 33 cents. Its capital is Agen. The surface of this department is diversified by fruitful eminences; but two-thirds of the soil are of a very inferior quality. It has several marshy tracts; the Landes consists of moveable sands; some parts near the Lot have a rugged and barren aspect; but the circle of Villeneuve d'Agen is distinguished by its fertility. The products are grain, fruits, few trees, and indifferent pastures. It has iron mines.

Lot's *Wife*, a stupendous rock in the sea, encompassing the Ladrone, which rises in the form of a pyramid, and is thus described by Mr. Meares in his voyage, cited by Mr. Pinkerton. "The latitude was 29 50' N., the longitude 142° 23' E. of Greenwich. The waves broke against its rugged front, with a fury proportioned to the immense distance they had to roll before they were interrupted by it. It rose almost perpendicular to the height of near 350 feet. A small black rock appeared just above the water, at about 40 or 50 yards from the western edge. There was a cavern on its south-eastern side, into which the waters rolled with an awful and tremendous noise. In regarding this stupendous rock, which stood alone in an immense ocean, we could not but consider it as an object which had been able to resist one of those great convulsions of nature that change the very form of those parts of the globe which they are permitted to desolate."

Lot, in a legal sense. See SCOT.

Lot, or *Loth*, in *Mining*, is the thirteenth dish, measure, or part of the miner's ore, which the bar-master takes up for the king, or the farmer.

Lot, or *Pot*, a liquid measure in French Flanders, each equal at Lille to 126 cubic inches, and 183.33 = 100 English gallons.

LOTA, in *Ichthyology*, the name of a species of the *Mustela fluviatilis*. See *GADUS Lota*.

LO-TCHEOU, in *Geography*, a town of Corea; 22 miles W.S.W. of Koang-tcheou.

LOTE TREE, in *Botany*. See *CELTIS*.

LOTH, in *Geography*, a town of Scotland, in the county of Sutherland, on the E. coast; 16 miles N.N.E. of Dornoch.

LOTH, or *Lod*, a weight in Germany; 2 loths being = 1 oz. and 16 oz. = 2 marks = 1 pfund or pound. In estimating the fineness of silver, the mark fine is divided into 16 loths, and the loth into 18 grains.

LOTHAIRE I., in *Biography*, emperor of the West, and king of Italy, eldest son of Lewis I., surnamed le Debonnaire, was born in 795. He was associated with his father in the imperial dignity in 817, and was crowned king of Lombardy in 821. (See LEWIS I.) On the death of his father he succeeded to the imperial dignity. Being confirmed in the title of emperor, he aimed at the possession of the whole of his father's territories, and endeavoured to deprive, of their inheritance, his brothers Lewis and Charles, who assembled all their forces to vindicate their rights. This great family quarrel was decided on the plains of Fontenoy. The conflict was terrible, and the ground disputed with an obstinacy, of which few examples are left on record in the sanguinary horrors of war. Historians agree in stating that a hundred thousand men fell on this occasion, and have in this in-

stance applied the remark, "that whole generations may be swept away by the madness of kings in the space of a single hour." Lothaire was completely defeated, and obliged to betake himself to flight. He went to Aix-la-Chapelle, where he diligently exerted himself to repair his losses. The vicissitudes of three successive years of discord exhausted at length the powers, without impairing the animosity, of the kindred princes, and they consented to divide those dominions for which they were no longer able to contend. By this division the French monarchy was divided into three shares, of which Lothaire, with the imperial dignity, retained Italy, with all the provinces situated between the Rhone, Rhine, Saone, Meuse, and Scheldt. After this partition, Lothaire passed some years, disquieted by the inroads of the Saracens upon Italy, and by differences with his half-brother Charles, till disgust with the cares of the world, and declining health induced him to abdicate his crown. The part of Gaul which Lothaire retained, he had distinguished by his own name, Lotharingia, which, by the insensible corruption of time, has sunk into that of Lorraine, which is still annexed to the district. But the empire which he had pursued at the expense of every filial duty, and which he had established by torrents of the best blood of his subjects, afforded him but a transient satisfaction. From the summit of grandeur which he had attained, the recollection of the past was melancholy and frightful, the prospect of the future was dreary and comfortless, and fifteen years after the death of his father he assumed the habit of a monk; the short space of a few days only, however, was allowed to the prayers of the royal penitent, when he died in the sixtieth year of his age. He left three sons, viz. Lewis, Lothaire, and Charles; of whom the first inherited Italy, with the title of emperor; the second, the kingdom of Lorraine; and the third that of Provence. Univer. Hist.

LOTHAIRE II., or LOTHARIUS, duke of Saxe-Supplemburg, was raised to the imperial throne, after the death of Henry V., in 1126, notwithstanding the opposition of two powerful competitors, who made very vigorous exertions for the support of their pretensions. But after a sanguinary and unavailing contest, they took the oath of allegiance, and were honoured with particular marks of their sovereign's friendship. Lothaire was crowned at Aix-la-Chapelle, in presence of the pope's nuncio. After he was quietly seated on his throne, he espoused the cause of pope Innocent II. against the anti-pope Anacletus, and undertook an expedition into Italy, to re-establish him in the papal chair. Lothaire was successful, and the event fully answered his expectations. Innocent remunerated his services by performing the ceremony of his coronation with great magnificence, but he had the art, at the same time, to make the emperor do homage to the holy see, of which the court of Rome availed itself to maintain that the empire was a fief of that see. Some time after these transactions, his holiness was exposed to imminent danger by an hostile incursion of Roger, king of Sicily, but Lothaire advanced to his assistance, and Roger's insult was punished by the loss of all his Italian possessions, and he himself was forced to retire into Sicily. These provinces Lothaire formed into a principality, which he conferred upon Renaud, a German, one of his relations. On his return into Germany, Lothaire was seized with a dangerous disemper, which terminated his life in the twelfth year of his reign. By command of this emperor, the Justinian code of laws, which had been in disuse for more than five centuries, was revived in the empire. This reign was rendered remarkable by excessive heat and a great drought in Germany, which actually withered the corn and blasted the fruits of the earth, dried up the most considerable rivers,

ivers, and occasioned a dreadful mortality among the cattle.

LOTHAIRE, king of France, succeeded his father, Lewis d'Outremer, in 954, being only in the 14th year of his age. He was at first under the protection of Hugh, duke of France, but on the death of that prince, in the following year, he assumed the reins of government. In 959, he was persuaded to enter into a treacherous plot for seizing the person of Richard, duke of Normandy, which failing of success an open war broke out, and the duke, pressed by the superior forces of his antagonist, invited the Danes to his support. France was accordingly afflicted by their indefatigable rapacity: independent and uncontrolled in their depredations, they refused to subscribe the peace which Richard concluded, and their retreat was with difficulty purchased by the treasures of France and Normandy. Lothaire had no sooner disengaged himself from this distress, than he attempted to oppress his vassal, the young count of Flanders, who was preserved by the interposition of the Normans; and the king, baffled in his endeavours to aggrandize himself by arms, flattered himself, with the hope of restoring the grandeur of the house of Charlemagne, by advantageous alliances. He accordingly espoused Emma, the daughter of Lothaire, king of Italy, and bestowed his sister on Conrad, king of Burgundy, but the short respite allowed by a peace was followed by years of desolating war, and the possession of Lorrain was disputed during four successive campaigns, by the kings of Germany and France. At length Lothaire thought it advisable to make peace, and leave the emperor in possession of Lorrain. This treaty gave great disgust to the French nobles; but the king found means to pacify or controul them; and on the death of Otho, the emperor, he re-entered Lorrain, took the town of Verdun, and assailed Cambray. When his affairs abroad were returning to a state of great prosperity, and when his authority at home was acquiring strength, he was suddenly surprized by the approach of death, whose power he was unable to resist. He died at Rheims in the forty-sixth year of his age, leaving his crown to his son Lewis V. Lothaire was unquestionably possessed of vigour and abilities, but he was insincere, and almost always engaged in contests with his neighbours and vassals. *Univer. Hist. Hist. of France, London, 1790.*

LOTHAU, in *Geography*, a town of Germany, in the principality of Culmbach; 9 miles S. of Culmbach.

LOTHIAN, an extensive district of Scotland, divided into three parts; viz. East-Lothian, or Haddingtonshire. Mid-Lothian, or Edinburghshire, and West-Lothian, or Liddisburghshire.

LOTHINGLAND, once an island, and part of the county of Suffolk, towards the German ocean, on the N.E. part of the county, and the most eastern part of Great Britain; now a peninsula, joined to the mainland by a narrow neck near Lowestoft, formed, as it has been supposed, about the year 1722. It is bounded on the N. by the river Yare, on the E. by the sea, by a lake, called Lothing, on the S., and by the river Waveny on the W. From N. to S. it is in length more than ten miles, and six in breadth; and contains sixteen parishes, of which Lowestoft is the principal and only market-town.

LOTICH, PETER, in *Biography*, surnamed *Secundus*, a distinguished modern Latin poet, was born, in 1528, in the county of Hama, in Germany. He received the early part of his education at a convent in his native place, and pursued his maturer studies at Frankfurt, Marburg, and Wittenberg, at which last place he contracted an intimacy with Melancthon and Camerarius. During the war in

Saxony he served a campaign in the army. In 1550 he visited France with some young persons to whom he was governor, and he continued there nearly four years. He afterwards went to Italy, where he had nearly been destroyed by poison prepared for another purpose: he recovered from the effects of it, but was subject to frequent relapses, one of which carried him off in the year 1560. He had taken his degree of doctor of physic at Padua, and three years previously to his death was chosen professor in that science at Heidelberg. In that situation he was honoured with the friendship of the elector-palatine, and by the excellence of his disposition, and the singular frankness and sincerity of his character, rendered himself universally beloved. A collection of his Latin poems was published the year after his decease, with a dedicatory epistle by Joachim Camerarius, who praises him as the best poet of his age: it has been very frequently reprinted. He had a younger brother Christian, likewise a poet. A collection of his poems, with those of his relation John Peter Lotich, was published in 1620. John Peter Lotich was a physician of eminence, who maintained the literary character of his family by a variety of writings. He was grandson of the above-mentioned Christian. He exercised his profession at Minden and at Hesse, and became professor of medicine at Rintlen in Westphalia. He died very much regretted in 1652. His principal works are, "Conciliorum et Observationum Medicinarum;" "Latin Poems;" "A Commentary on Petronius;" and "A History of the Emperors Ferdinand II. and III." in four volumes, is attributed to him.

LOTIERO, Sr., in *Geography*, a town of Naples, in Principato Ultra; 15 miles E.N.E. of Benevento.

LOTINE, in the *Ancient Mus.* Athenæus relates, in his *Deipnos.* that the flute entitled lotina was the same instrument as that which the Alexandrians termed *Photinga*, adding, that it was made of the wood of the lotos tree, which grew in Africa.

LOTION, *LOTIO*, popularly called *wash*, denotes a form of medicine, made up of liquid matters, chiefly used for beautifying the skin, and cleaning it from those deformities which a disordered blood sometimes throws on it: or rather, which are occasioned by a preternatural secretion.

LOTION also denotes a remedy, possessing a medium between a fomentation and a bath.

There are refreshing and fomentiferous lotions for feverish persons, made of leaves, flowers, and roots boiled, with which the feet and hands of the patient are washed; and after washing, wrapped up in linen, steeped in the same decoction till dry.

There are lotions also for the head and hair.

LOTION, in *Pharmacy*, denotes a preparation of medicines, by washing them in some liquid, either made very light, so as to take away only the dregs; or sharp, so as to penetrate them, in order to clear them of some salt, or corrosive spirit, as is done to antimony, precipitates, magisteries, &c. &c.; or intended to take away some foulness, or ill quality; or to communicate some good one.

LOTION, *Saponaceous, Lotio saponacea*, the name of a form of medicine prescribed in the late London pharmacopœia, being properly soap in a liquid form. It is ordered to be made thus: Take damask rose-water, three quarters of a pint; oil of olives, a quarter of a pint; ley of tartar, half an ounce in measure: rub the ley and oil together till they are mixed, and then gradually add the water.

LOTOMETRA, in *Botany*, a name given by many of the ancients to the *nymphaea Indica*, or *Ægyptiaca*, called also the *fabæ Ægyptiaca*, and originally the *nihyar*, an abbreviation of *nihufar*; *nufar* signifying a water-lily, and the prefix

prefix *nil* expressing its growing particularly in the river Nile.

Neophytus tells us, that this lotometra has leaves of a middle form between those of the common nymphæa, which are roundish, and those of the arum, which are oblong and pointed, and are cordated at the base; and this is the very figure of the leaves of the faba *Ægyptiaca*, as we see it in all paintings, &c.

LOTOS (see LOTUS) is held in the highest veneration in India, inclusive of Thibet and Nepal. Among the Brahmins and enthusiastic Hindoos, no object in nature is looked on with more superstition; and their books abound with mystical allusions to this lovely aquatic. Being esteemed the most beautiful of vegetables, it not unappropriately furnishes a name for the Hindoo queen of beauty, and *Kamal* or *Kamala* is, as noticed under that article, a name of Lakshmi; as is Padma or Padma, another Sanscrit appellation for both. (See LAKSHMI.) Under the form of Kamala, Lakshmi is usually represented with a lotos in her hand, and in most pictures and statues of her consort Vishnu, he is furnished with the Padma, or lotos bud, in one of his four hands, as a distinguishing attribute. Accordingly, as it is represented in different stages of efflorescence, it varies, in the eye of mystics, its emblematical allusions. As an aquatic, the lotos is a symbol also of Vishnu, he being a personification of water or humidity, and he is often represented seated on it. Brahma, the creative power, is also sometimes seated on the lotos, and is borne on its calyx in the whimsical representation of the renovation of the world, when this mythical plant issued out of the navel of Vishnu from the bottom of the sea, where he was reposing on the serpent Sesha. (See SESHA.) The following extract from the curious and learned dissertation of Major Wilford, "On the sacred Isles of the West," will serve to shew the wild extravagance of Hindoo mythologists. "The nymphæa, or lotos, floating on the water, is an emblem of the world; the whole plant signifies both the earth and its two principles of fecundation. The stalk originates from the navel of Vishnu, sleeping at the bottom of the ocean; and the flower is the cradle of Brahma, or mankind. The germ is both Meru and the Linga; the petals and filaments are the mountains which encircle Meru, and are also the type of the Yoni." (Asiatic Researches, vol. viii.) This may suffice as to the extravaganzas of Hindoo myths. The reader may see farther hereon under our articles LINGA, MERU, and YONI. Hindoo poetry also superabounds in allusions to the lotos. One allusion, connected with an interesting fact in natural history, we will notice. In the northern parts of India the petals of the lotos are blue, as well as red and white; while in the southern provinces the blue flower is not seen; the poets have hence feigned that the crimson hue was imparted to it by the blood of Siva issuing from the wound made by the arrow of Kama, when the god of love daringly endeavoured to inspire the "king of dread" with an amorous passion, for which presumption he was reduced to ashes, or, as some say, to a mental essence, by the fire which issued from the forehead of the "three-eyed god." (See KAMA and SIVA.) In the Hindoo Pantheon, necessarily comprising a great mass of mythology in its mythological details, the reader will find many particulars and plates connected with the subjects of this article.

LOTTERY, a kind of game of hazard, wherein several lots of merchandize, or sums of money, are deposited as prizes, for the benefit of the fortunate.

The design of lotteries, and the manner of drawing them, are too well known among us to need a description: they are very frequent in England and Holland, where they cannot

be set on foot without the permission of the magistrate.—In France too, there have been several lotteries in favour of their hospitals.

M. Le Clerc has composed a treatise of lotteries, wherein is shewn what is laudable, and what blameable in them.—Gregorio Leti has also a book on the subject of lotteries. Father Menestrier has a treatise on the same, published in 1700, where he shews their origin and use among the Romans. He distinguishes several kinds of lotteries, and takes occasion to speak of chances, and resolves several cases of conscience relating thereto. See several statutes relating to lotteries under the article GAMING.

An act passed in 1778, for regulating the conduct of the lottery, restrains any person from keeping an office for the sale of tickets, shares, or chances, or for buying, selling, insuring, or registering, without a licence; for which licence each office-keeper must pay 50*l.*, if it be in, or within twenty miles of London, Edinburgh, or Dublin, and 10*l.* for every licence for every other office, to continue in force for one year, and the produce to be applied towards defraying the expences of the lottery. And no person is allowed to sell any share or chance less than a sixteenth, on the penalty of 50*l.* All tickets divided into shares or chances are to be deposited in an office, to be established in London by the commissioners of the treasury, who are to appoint a person to conduct the business thereof; and all shares are to be stamped by the said officer, who is to give a receipt for every ticket deposited with him. The numbers of all tickets so deposited are to be entered in a book, with the names of the owners, and the number of shares in to which they are divided; and two-pence for each share is to be paid to the officer on depositing such tickets, who is then to pay all expences incident to the office. All tickets deposited in the office are to remain there three days after the drawing. And any person keeping an office, or selling shares, or who shall publish any scheme for receiving money in consideration of any interest to be granted in any ticket in the said lottery, &c. without being in possession of such ticket, shall forfeit 500*l.* and suffer three months imprisonment. And no business is to be transacted at any of the offices after eight in the evening, except on the evening of the Saturday preceding the drawing. No person is to keep any office for the sale of tickets, &c. in Oxford or Cambridge, on penalty of 25*l.* Before this regulating statute took place, there were upwards of 400 lottery offices in and about London only; but the whole number afterwards, for all England, as appeared by the list published by authority, amounted to no more than 51. They were, however, at this time much more numerous.

By 42 Geo. III. c. 119, all games or lotteries called little-goes are declared public nuisances, and all persons keeping an office or place for any game or lottery not authorized by law, shall forfeit 500*l.* and be deemed vagabonds and vagabonds. The proprietor of a whole ticket may nevertheless insure it for its value only, with any ticket office, for the whole time of drawing, from the time of insuring, under a *bona fide* agreement, without a stamp. The last state lottery act enacting various new regulations was 49 Geo. III. c. 94.

The proposals for the first public lottery of which we have any account were published in 1567 and 1568, and it was drawn in 1569, at the west door of St. Paul's cathedral. The tickets were sold at ten shillings each, and there were no blanks. The prizes consisted chiefly of plate, and the profits of it were intended for repairing the heavens of the kingdom, and other public works. In 1612, James I. granted permission for a lottery to be held also at the west end of St.

Paul's,

LOTTERY.

Paul's, of which the highest prize was of the value of 4000 crowns, in fair plate; this was for the assistance of the Virginia company, who were licensed to open lottery offices in any part of England, by which means they raised 20,000*l.* At length these lotteries became to be considered as public evils, and at last the attention of parliament: they were represented by the commons as a grievance, and were suppressed by an order of council. In 1630, however, Charles I. granted a special licence for a lottery or lotteries, according to the course of other lotteries hitherto used or practised, for defraying the expence of a project for conveying water to London. Soon after the revolution, lotteries were resorted to, among other expedients, for raising part of the extraordinary sums necessary for the public service, by which means the disposition for this species of gambling was greatly encouraged and extended; and private lotteries, formed on the most delusive and fraudulent principles, became so general, not only in London, but in all the other principal towns in England, that parliament found it necessary, in 1693, to pass an act for suppressing them, by which a penalty of 500*l.* was laid on the proprietors of any such lotteries, and 20*l.* upon every adventurer in them; notwithstanding which, the disposition to fraud on the one hand, and for adventure on the other, continued to prevail, and small lotteries were carried on under the denomination of sales of gloves, fans, cards, plate, &c. This was attempted to be checked by a clause in an act passed 1712, which only gave rise to a new mode of carrying on this kind of gambling. Government lotteries were still practised, and the adventure was now made to depend upon the drawing of the former; and the buying and selling of chances and parts of chances of tickets in the state lotteries became a general practice, till it was prohibited by an act passed in 1718, by which all the undertakings resembling lotteries, or being dependent on the state lottery, were strictly prohibited, under the penalty of 100*l.*, over and above all penalties enjoined by former acts of parliament against private lotteries.

During the reign of queen Anne, the lotteries were generally for terminable annuities, to which both blanks and prizes were entitled at different rates; thus in 1710, the lottery consisted of 150,000 tickets, valued at 10*l.* each, every ticket being entitled to an annuity for 32 years, the blanks at 1*l.* per annum, and the prizes to greater annuities, from 5*l.* to 1000*l.* per annum. This was the first lottery for which the bank of England received the subscriptions for government. In the following year the whole of the money advanced for the tickets was to be repaid, both in blanks and prizes, in 32 years, with interest at 6*per cent.* and an additional sum of nearly half a million to be divided, in order to form prizes, which additional capital was to be paid with the like interest within the same period as the original sum. In this manner they were conducted for several years, and a very considerable premium was given for the money advanced, in addition to a high rate of interest.

According to the lottery plans which prevailed from fir Robert Walpole's administration to that of the duke of Grafton, the tickets were issued at 10*l.* each; and occasionally the subscription was open to the public at large. The highest prize was generally 10,000*l.* and the lowest 20*l.* There were from four to six blanks to a prize, and the blanks entitled the bearers to 5*l.* or 6*l.* stock in the three or four *per cent.* bank annuities, the value of the blanks and prizes being generally funded. The lottery-office keepers divided the tickets into shares and chances, the former entitling the holders to the proportion they had purchased of blanks and prizes, the chances to prizes only; that is, they had no return if the ticket was drawn a blank.

The tickets, according to the advantage or disadvantage of the scheme, in respect of the number of blanks to a prize, and the number of high prizes, generally sold at from 11*l.* to 12*l.* before the drawing. When the tickets sold for 11*l.* and the blanks were entitled to 6*l.* in the three *per cent.* bank annuities, as the blank might be sold for 5*l.* 8*s.* ready money when the three *per cents.* were at 90, the adventurer only gambled at a risk of 5*l.* 12*s.*; and at the highest calculation, when tickets were worth 13*l.*, he never staked more than 7*l.* 12*s.* for a ticket before the drawing.

In 1759, the scheme of the lottery included two prizes of 20,000*l.* each, which had not been the case in any preceding lottery since the time of queen Anne. The scheme for the year 1767 contained one prize of 20,000*l.*, and this was many years after the usual amount of the highest prize. About this time a material alteration was made in the plan of the lotteries; the allowance to blanks was discontinued, the whole sum being divided into prizes, the number of which was of course considerably increased, particularly as the proportion of small prizes was much greater than it has since been, and in several of the following years was less than two blanks to a prize. All the lotteries during the time lord North was chancellor of the exchequer were formed on this principle, with some variation in the schemes, which favoured the holders of tickets and the lottery-office keepers, and greatly increased the spirit of gaming, such as paying the prizes in money instead of stock, and making the first drawn ticket for several successive days a prize of 1000*l.* or more, which enhanced the price of the tickets, and encouraged persons who had blanks drawn to buy again. Some judicious regulations were, however, adopted for the security of persons purchasing shares of tickets, by limiting the shares into which tickets may be divided into halves, quarters, eighths, and sixteenths; and obliging all lottery-office keepers to deposit the tickets they divided into shares in the bank, and to have the said shares examined and stamped. The practice of insuring tickets and shares was likewise restrained, by enacting, that "no person shall sell the chance or chances of any ticket or any share, for any time less than the whole time of drawing from the day of sale; nor shall receive any sum of money whatsoever in consideration for the repayment of any sum, in case any ticket shall prove fortunate, or in any case of any chance or event relating to the drawing, either as to time, or its being fortunate, nor shall publish proposals for the same, under the penalty of 500*l.*, one-half to be paid to the person suing for the same, and the other moiety to his majesty."

During Mr. Pitt's administration the lotteries were contracted for entirely distinct from the loans of the respective years; and as it became necessary to endeavour to augment every source of the revenue as much as possible, various alterations were made in the lottery schemes, chiefly with a view of raising the price of tickets, and of keeping up the price during the time of drawing. The number and amount of the highest prizes were increased, some schemes containing four prizes of 2,000*l.* each, others of two 30,000*l.* prizes, while, for the purpose of disposing of a greater number of tickets in the course of the year, the lottery was divided into two or three smaller ones, drawn at different times; the amount of the principal prize was still farther augmented; the lottery drawn in October 1807 containing a prize of 40,000*l.*, and that drawn in June 1808 six prizes of 20,000*l.* each.

But notwithstanding the temptations which these schemes held out to the inconsiderate, the contractors found, either from the greater frequency of lotteries, or the increased number of tickets, that it became impossible to get the

the tickets off their hands, without resorting to a variety of expedients for attracting the public attention, which were carried to such a length as to become a public nuisance.

This and many serious evils which were known to exist relating to lotteries, particularly that of illegal insurances, gave rise, in 1808, to a committee of the house of commons, which was appointed in order to enquire "how far the evil attending lotteries had been remedied by the laws passed respecting the same." In the report of this committee, various instances were adduced of the most serious evils, attested by the most respectable witnesses, some of which are so striking, that we cannot resist the mention of them in the present article. One case, which was attested by the Rev. Mr. Gurney, is particularly interesting, as it shews to what an amazing extent this kind of gambling will carry persons, who, had it not been for the temptations held out by lotteries, might have lived with comfort and respectability, but who, from these kinds of speculations, have been reduced to the most abject state of poverty and distress. "I knew," says Mr. Gurney, "a widow in a good line of business, as a silk dyer, which, I suppose, brought her in about 400*l.* a-year clear. She kept a very good house, and I was in habits of intimacy with the family. The foreman she had was in the habit of insuring in the lottery; he was led astray by an acquaintance, and he and his mistress insured to the amount of from 300*l.* to 400*l.* in a night, although the foreman had only 30*l.* a-year wages. It appeared, on his decease, he had insured immense sums of money within the last year of his life. I found that he had expended upwards of 100 guineas in the lottery, purchasing one ticket at 16*l.* and insuring away the rest. It came up a blank at last, and I verily believe the disappointment was the cause of his death. He died insolvent, and I acted as his executor, and paid three or four shillings in the pound to his creditors. He had received a great many bills for his mistresses, which he had never accounted for, and was the ruin of her also; she was not able to pay three shillings in the pound. She was obliged to go to an alms-house, and died there in four or five months. They would send all the plate she possessed to raise money to carry on an insurance, which had begun perhaps at a low rate. The gentleman who drew the foreman into this practice was himself also ruined by it. His wife had an annuity of 400*l.* *per annum* settled upon her, he sold her life interest, and she was obliged to live afterwards upon charity, while her husband, who had formerly kept his carriage, and lived in a good house in Queen-square, spent the last hours of his miserable existence within the walls of the Fleet prison." Various other instances of a similar kind were mentioned in the appendix to the report of the committee, where the parties formerly in respectable circumstances were reduced to misery and distress. But what serves to mark the evils of lotteries the stronger is, that it is not only the unsuccessful adventurer that is ruined by the failure of his speculation, but there are as many cases where a successful speculator has had equal reason to deplore his first connection with this species of gambling. Robert Baker, esq. deposed, that "he remembered one very strong instance of distress arising out of the transactions in the lottery four or five years ago. It was the case of a journeyman who belonged to a club, which club purchased a ticket that came up the great prize. The share of this man was 100*l.* or thereabouts; he had been an industrious working man before, and he was persuaded by his friends to invest the money in the stocks, in the joint name of himself and wife, in order to prevent his making away with it. He did so, but soon got into habits of idleness after he was possessed of the money; and he wanted his wife to join in

the transfer of it. This occasioned quarrels, which proceeded to assaults; he changed his habits of industry to those of drunkenness and idleness, he destroyed all his domestic comforts, and was the ruin of his family." Many other cases of a similar description are given in the appendix to this report; in some of them mothers have neglected their children, and left them destitute of the common necessities of life, while the money by which those necessities should have been purchased has been gambled away in the insurance of certain numbers in the lottery. In other cases the wife has robbed an industrious and careful husband and father of the small and hard-earned savings of many months, and even of many years; and who, instead of finding his little treasure in the drawer, in which it was deposited, and which he was about to increase by another small addition, found that the whole had been gambled away in lottery speculations, and every article of his clothes, which were not likely to be immediately wanted, had been pawned in order to recover the former loss.

In other cases, children have robbed their parents; servants their masters; suicides have been committed, and almost every crime that can be imagined has been occasioned, either directly or indirectly, through the baneful influence of lotteries. These evils are the more to be regretted, as they receive a sort of sanction from the government itself, and whatever laws may be enacted to check them they will always exist, in a greater or less degree, while lotteries are employed as a means of increasing the revenue of the country, and certainly in no other case would they be permitted to exist. The object of government is the happiness of the people, and every means that can be employed to attain this object it is the duty of government to employ; but this can never be accomplished without strict and constant attention to morals as well private as public; but how little are lotteries calculated to produce this effect, which, instead of improving the morals, hold out the most delusive schemes to attract the attention of the ignorant and unwary, and draw them aside from the paths of industry and contentment, to embark in a gambling concern, which generally terminates in poverty and wretchedness.

The committee before which the above mentioned facts were disclosed, were fully aware of all the evils we have recounted, and in the course of their report, declared, that "the foundation of the lottery system is so radically vicious, that your committee feel convinced, that under no system of regulations which can be devised, will it be possible for parliament to adopt it as an efficacious source of revenue, and at the same time divest it of all the evils of which it has hitherto proved so baneful a source.

"But, (in case it should be thought expedient to continue state lotteries,) the number, therefore, in each year, should be limited to two lotteries, of not more than 30,000 tickets each; that the number of days allowed for drawing, instead of ten, should be brought down to eight for each lottery, the number fixed in 1802; that the number of tickets to be drawn each day should be uncertain, and left to the direction of the commissioners of stamp-duties, and kept secret till the close of the drawing each day; care being taken, as the lottery proceeds, not to leave too great a number undrawn on the latter days of drawing; but that one moiety, or upwards, be drawn on the four first days thereof; that every lottery-office keeper should, in addition to his own licence, take out a limited number of licences for his agents; that the limitation of hours during which lottery-offices may be open for the transaction of business, *viz.* from eight o'clock in the morning till eight o'clock in the evening, enacted by

LOTTERY.

22 Geo. III. c. 47, and renewed in the lottery acts in 1802, and the three following years, but omitted in those of 1806 and 1807, ought in future to be re-enacted, without the exception therein made, to Saturday evenings."

These suggestions have been attended to in the lotteries of the last two or three years, which have been several of them drawn in one day, and consequently a considerable check has been given to illegal insurances. Still, however, many evils remain, which are so blended with the nature of lotteries, that it is impossible to separate them, and it may fairly be questioned, whether, for the sake of a sort of voluntary tax, which is thus imposed upon ignorance and folly, the morals of many industrious and honest members of society ought to be exposed to the danger of being enfeebled by the delusive hopes of gain, which the lottery schemes are calculated to inspire. With regard to the advantage that the revenue derive from the lottery system, it may likewise be collected from the reported account above alluded to. Mr. Shewell informed the committee, that the general advance put upon tickets by the contractor, was about 3*l.* per ticket, not varying much under or over. This is in consideration of the certain loss on such tickets as the contractor is not able to sell, the expence he must necessarily be put to in the sale of his lottery, and the profit that he naturally expects on such a concern. The lottery is considered as sold pretty well, of which four-fifths of the tickets are disposed of: the contractors of the lottery in hand, at the time of this enquiry, expected not to sell more than 17,000 tickets out of the 25,000, of which it consisted. The tickets in this lottery were sold by the chancellor of the exchequer at 17*l.* and a fraction, the tickets of which were not worth quite 1*cl.* each; the contractor sold it again to the licensed lottery-office keepers at 20*l.* 19*s.* per ticket, between three and four pounds more than they gave for it. The lottery-office keeper puts on another profit, which, in those numbers divided in eighths, sixteenths, &c. amounts to about 1*l.* per ticket; whence it is obvious, that the adventurer in this lottery (and this may be considered as an average of lotteries in general), gamble at a disadvantage of 100 per cent. Government is a gainer of about 70 per cent, besides about 20 per cent. farther, which is supposed to be added to the revenue by the postage of letters, stamps, duties on advertisements, excise duty, on candles, paper, &c. On the face of the concern there appears, therefore, a considerable profit to government, which, at a mean, may be estimated at about 750,000*l.* per annum; but it was the opinion of those who are best qualified to judge of these subjects, that this increase of revenue was rather apparent than real; that the extra parochial taxes, brought on by the distress they occasion; the decreased consumption of exciseable articles, just before, and during the time the lottery is drawing, and for a few weeks afterwards, which decrease was actually ascertained from competent witnesses, fully counterbalance the apparent gain. Should this be the true state of the case, what can induce the ministers to continue to give their sanction to such delusive and dangerous species of gambling? At all events, if the above profit were real, no revenue is obtained by the state at half the expence, in point of pecuniary sacrifice to the public, independent of the excessive injury to the morals of the people. We have already seen, that the purchasers of legal shares gamble at the disadvantage of 100 per cent.; and the insurances are carried on, to the disadvantage of the public, at about 4 per cent.; but still it is not easy to estimate the annual expence which lotteries cost the public; the following statement, however, is hazarded by P. Colquhoun, esq. and submitted to the above-mentioned committee.

Suppose three annual lotteries, each of 25,000 tickets, the public receives	£. 600,000
Contractors profit at 1 <i>l.</i> per ticket	75,000
Lottery-office keeper's profit	100,000
Insurer's profit 33½ per cent. on 1,000,000 <i>l.</i>	333,000
Total	£. 1,108,000

The public are supposed to pay for 75,000 tickets, including the additional advance on halves, quarters, &c.	1,275,000
The lower class who insure are supposed to pay	1,000,000
	£. 2,275,000

Deduct prizes	750,000
Deduct prizes obtained by insurers	250,000
	1,000,000

Loss to the public to gain 600,000 <i>l.</i> to the revenue yearly	1,275,000
--	-----------

This estimate seems to have been made upon the most favourable suppositions, and probably falls considerably short of the real loss sustained by the public.

The following is an account of the prices of tickets, and immediate profit derived from them by the state, during the six years from 1802 to 1807.

Year.	No. of tickets.	Price.	Profit.
1802	100,000	£. 14 11 0	£. 555,000
1803	80,000	13 13 1	352,333
1804	1	25,000	14 15 6
—	2	25,000	15 16 0
—	3	30,000	15 13 6
			£. 434,625
1805	1	25,000	17 2 9
—	2	25,000	18 3 0
—	3	25,000	17 18 9
			£. 580,660
1806	1	20,000	16 12 0
—	2	25,000	16 14 3
—	3	25,000	16 10 0
—	4	20,000	16 19 0
			£. 601,312
1807	1	20,000	17 13 6
—	2	25,000	17 4 0
—	3	25,000	16 10 6
			£. 496,125

To these sums are to be added the advantages derived from postages, stamps, &c. which are generally estimated at 2*l.* per ticket, making the mean annual profit about 750,000*l.* But after deductions are made for the losses sustained

LOTTERY.

tained from causes connected with the lottery system, it is doubtful whether any real advantage is derived from this source; and if even the whole of the above was a real saving, the evils attending it are such as to lead us to hope, that ministers will find some other means of raising an equivalent, founded upon more liberal principles, and less dangerous to the morals and happiness of the people.

Having said thus much with regard to the general policy of lotteries, we shall conclude the present article by an investigation of the theory of lotteries, as it is connected with the doctrine of chances.

PROB. I.

Any number of things being given, as a, b, c, d, e, f ; to find the probability that in taking three of them, as they happen, they shall be any three proposed, as a, b, c .

First, the probability of taking either a or b , or c , will be $\frac{3}{6}$ ths, and supposing one of them, as a , to be taken, then the probability of taking either b or c will be $\frac{2}{5}$ ths. Again, let either of them be taken, suppose b ; the probability of taking c in the third place will be $\frac{1}{4}$ th; wherefore the probability of taking the three things proposed, viz a, b, c , will be

$$\frac{3}{6} \times \frac{2}{5} \times \frac{1}{4} = \frac{1}{20}.$$

Otherwise, we might consider what number of combinations of six things can be formed by taking three at a time; and out of this number there is obviously only one combination that answers the conditions of the problem proposed; and there are, therefore, so many chances to one against the success of the trial.

Now, the number of such combinations is expressed by

$$\frac{6 \times 5 \times 4}{3 \times 2 \times 1} = 20.$$

And, consequently, the chance of drawing the specified things a, b, c , is $\frac{1}{20}$ th, as before.

Corollary.—Universally, the number of combinations that can be formed, of n things taking p , at a time, is expressed by

$$\frac{n \cdot (n-1) \cdot (n-2) \cdot (n-3) \cdot \dots \cdot (n-p)}{p \cdot (p-1) \cdot (p-2) \cdot (p-3) \cdot \dots \cdot 1}$$

and consequently, the reciprocal of this fraction will be the probability of success in any case that may arise.

PROB. II.

Let the same six things be proposed as above, to determine the probability, that in drawing four of them, the three specified ones, as a, b, c , shall be taken.

First, the number of combinations that can be formed of six things, taking three at a time, is $\frac{6 \times 5 \times 4}{3 \cdot 2 \cdot 1} = 20$;

and the number of combinations that can be formed out of

four things, taking three at a time, is $\frac{4 \times 3 \times 2}{3 \times 2 \times 1} = 4$.

Whence it follows that out of the twenty combinations of threes which may happen, four of them will be in hand; and, therefore, the probability of taking the three specified

things under the condition of the problem, is $\frac{4}{20} = \frac{1}{5}$.

And hence, generally, to determine the probability, that in drawing out of a given number of tickets n , any proposed number p , there shall be found amongst them any number of

VOL. XXI.

specified ones q , we must divide the first of the following series by the second, viz.

$$\begin{aligned} 1. & \frac{p \cdot (p-1) \cdot (p-2) \cdot (p-3) \cdot \dots \cdot (p-q)}{q \cdot (q-1) \cdot (q-2) \cdot (q-3) \cdot \dots \cdot 1} \\ 2. & \frac{n \cdot (n-1) \cdot (n-2) \cdot (n-3) \cdot \dots \cdot (n-q)}{q \cdot (q-1) \cdot (q-2) \cdot (q-3) \cdot \dots \cdot 1} \end{aligned}$$

that is, the proposed chance will be expressed by the fraction

$$\frac{p \cdot (p-1) \cdot (p-2) \cdot (p-3) \cdot \dots \cdot (p-q)}{n \cdot (n-1) \cdot (n-2) \cdot (n-3) \cdot \dots \cdot (n-q)}.$$

PROB. III.

To find what probability there is, that in taking at random seven counters out of twelve, whereof four are white, and eight black, there shall be at least three white ones.

1. Find the chance for taking three white out of four, which will be

$$\frac{4 \times 3 \times 2}{3 \times 2 \times 1} = 4.$$

2. The number of chances for taking four black out of eight is, on the same principle, found to be

$$\frac{8 \times 7 \times 6 \times 5}{4 \times 3 \times 2 \times 1} = 70.$$

And, therefore, the chances of both succeeding is $4 \times 70 = 280$.

But by the question, he may hold four white and three black, because it is only limited that three white be taken, and not that there should be three white and no more.

3. How the number of chances for taking four white out of four is one.

4. The number of chances for taking three black out of eight is

$$\frac{8 \times 7 \times 6}{3 \times 2 \times 1} = 56.$$

And the product of these two is $56 \times 1 = 56$, therefore the whole number by which the event may succeed, is $280 + 56 = 336$.

5. But the whole number of combinations that can be formed out of twelve things, taking seven at a time, is

$$\frac{12 \cdot 11 \cdot 10 \cdot 9 \cdot 8 \cdot 7 \cdot 6}{7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} = 792;$$

therefore $\frac{336}{792} = \frac{14}{33}$, will express the probability that

the event will happen, and consequently $1 - \frac{14}{33} = \frac{19}{33}$, is the probability of its failing: that is, the odds against three white counters being drawn, are as 19 to 14.

Corollary.—Let a be the number of white counters, b the number of black, n the whole number $= a + b$; c the number of counters to be taken out of the number n : also, let p represent the number of white counters that are to be found precisely in c . Then the number of chances for taking none of the white, or one of the white, or two of the white, and no more; or three of the white and no more; or four of the white and no more, &c. will be expressed as follows:

$$\left\{ \frac{a}{1} \times \frac{a-1}{2} \times \frac{a-2}{3} \times \frac{a-3}{4} \text{ \&c. } \right\} \times \left\{ \frac{b}{1} \times \frac{b-1}{2} \times \frac{b-2}{3} \times \frac{b-3}{4} \text{ \&c. } \right\}$$

The number of terms in which a enters being equal to the number

LOTTERY.

number p ; and the number of terms in which b enters being equal to the number $c - p$.

But the number of all the chances for taking a certain number c , of counters out of the number n , is expressed by

$$\frac{n}{1} \times \frac{n-1}{2} \times \frac{n-2}{3} \times \frac{n-3}{4} \&c.$$

to be continued to as many terms as there are units in c .

If the numbers n and c were large, such as $n = 40000$, and $c = 8000$, the foregoing method would seem impracticable, on account of the great number of terms to be taken in both series, whereof the first is to be divided by the second; though if those terms were actually set down, a great many of them being common divisors might be expunged out of both series; for which reason it will be convenient to use the following theorem, which is a contraction of that method, and which will be chiefly of use when the white counters are but few. Let, therefore, n be the number of all the counters, a the number of white, b the number of black, c the number of counters to be taken out of the number n , p the number of white that are to be taken precisely, then making $n - c = d$. The probability of taking precisely the number p of white counters will be as follows: *viz.* making

$$c \cdot (c-1) \cdot (c-2) \cdot (c-3) \&c. = C$$

$$d \cdot (d-1) \cdot (d-2) \cdot (d-3) \&c. = D$$

$$\frac{a}{1} \times \frac{a-1}{2} \times \frac{a-2}{3} \times \frac{a-3}{4} \&c. = A$$

$$n(n-1)(n-2)(n-3)\&c. = N$$

$$\text{the probability} = \frac{C \times D \times A}{N}$$

where it is to be observed, that the first and third series contain as many terms as there are units in p ; the second as many as there are in $a - p$; the fourth as many as there are in a .

Let us now apply these results in the solution of the following problems.

PROB. IV.

In a lottery consisting of 40000 tickets, among which are three particular benefits, what is the probability that taking 8000 of them, one or more of the particular benefits shall be among them. Substitute 8000, 40000, 32000, 3, and 1 respectively for c, n, d, a , and p , in that problem; and the probability of taking precisely one of the three particular benefits will appear to be

$$\frac{8000 \times 32000 \times 31999 \times 3}{40000 \times 39999 \times 39998} = \frac{48}{125} \text{ nearly.}$$

$$\text{If } p = 2, \text{ the probability of taking precisely two of the particular benefits will be } \frac{8000 \times 7999 \times 32000 \times 3}{40000 \times 39999 \times 39998}$$

$$= \frac{12}{125} \text{ nearly. If } p = 3, \text{ the probability of taking all the}$$

$$\text{three particular benefits will be } \frac{8000 \times 7999 \times 7998}{40000 \times 39999 \times 39998} =$$

$$\frac{1}{125}. \text{ And the probability of taking one or more of the}$$

$$\text{three particular benefits will be } \frac{48 + 12 + 1}{125} = \frac{61}{125} \text{ very}$$

nearly. These three operations might have been contracted into one by inquiring the probability of not taking any of

the three particular benefits, which will be found to be $\frac{32000 \times 31999 \times 31998}{40000 \times 39999 \times 39998} = \frac{64}{125}$ nearly, which being sub-

tracted from unity, gives a remainder, $1 - \frac{64}{125} = \frac{61}{125}$,

shewing the probability required; and therefore the odds against taking any of three particular benefits will be 64 to 61 nearly.

PROB. V.

To find how many tickets ought to be taken in a lottery consisting of 40000, among which are three particular benefits, to make it as probable that one or more of these three may be taken as not. Let the number of tickets requisite to be taken be x , and the probability of not

taking any of the particular benefits will be $\frac{n-x}{n} \times$

$$\frac{n-x-1}{n-1} \times \frac{n-x-2}{n-2}; \text{ but this probability is equal to}$$

$\frac{1}{2}$, since by hypothesis, the probability of taking one or more of them is equal to $\frac{1}{2}$; whence we shall have the equation

$$\frac{n-x}{n} \times \frac{n-x-1}{n-1} \times \frac{n-x-2}{n-2} = \frac{1}{2}, \text{ from the solu-}$$

tion of which x will be found nearly equal to 8252. The terms of this equation, M. De Moivre observes, may be considered as being in geometric progression; since the factors both of the numerator and denominator are few and in arithmetic progression, and their difference very small in respect of n ; and, therefore, the cube of the middle term may be supposed equal to the product of the multiplication

$$\text{of these terms; whence will arise the equation, } \left[\frac{n-x-1}{n-1} \right]^3 =$$

$\frac{1}{2}$; or, neglecting the unit both in the numerator and denomi-

$$\text{nator, } \left[\frac{n-x}{n} \right]^3 = \frac{1}{2}, \text{ and } x, \text{ consequently, } = n \left(1 - \sqrt[3]{\frac{1}{2}} \right),$$

or $n \left(1 - \frac{1}{2} \sqrt[3]{4} \right)$; but $n = 40000$, and $1 - \frac{1}{2} \sqrt[3]{4} = 0.2063$; therefore $x = 8252$.

PROB. VI.

To determine accurately, in a lottery of 100000 tickets, whereof 90000 are blanks, and 10000 are benefits, what the odds are of taking or not taking a benefit, in any number of tickets assigned. Let the number be 6; and it will appear, by the above cited problem, that the number of chances for taking no prize in 6 tickets, making $a = 10000, b = 90000,$

$$c = 6, p = 0, n = 100000, \text{ will be } \frac{90000}{1} \times \frac{89999}{2} \times$$

$$\frac{89998}{3} \times \frac{89997}{4} \times \frac{89996}{5} \times \frac{89995}{6}; \text{ and that the}$$

$$\text{whole number of chances will be } \frac{100000}{1} \times \frac{99999}{2} \times$$

$$\frac{99998}{3} \times \frac{99997}{4} \times \frac{99996}{5} \times \frac{99995}{6}; \text{ then dividing the}$$

first number of chances by the second, by means of logarithms, the quotient will be 0.53143, the probability required: this decimal fraction being subtracted from unity, the remainder 0.46857 shews the probability of taking one prize or more in six tickets; wherefore the odds against taking any prize in six tickets will be 53143 to 46857. If the number of tickets be seven, then carrying each number of

of chances above written one step farther, we shall find that the probability of taking no prize in seven tickets is 0.47828, which subtracted from unit leaves a remainder 0.52172, which shews the odds of taking one prize or more in seven tickets to be 52172 to 47828.

PROB. VII.

With the same data, to find the value of the chance of a prize, supposing each ticket to be 10*l.*, and that after the lottery is drawn 7*l.* 10*s.* be returned to the blanks. There being 90000 blanks, to each of which is returned 7*l.* 10*s.* the total value of the blanks is 675,000*l.* and consequently the total value of the benefits is 325,000*l.* which being divided by 10000, the number of benefits, gives a quotient 32*l.* 10*s.* and, therefore, one might for the sum of 32*l.* 10*s.* be entitled to have a benefit certain, taken at random out of the whole number of benefits: the purchaser of a chance has, therefore, one chance in ten for the sum of 32*l.* 10*s.* and nine chances in ten for losing his money; from whence it follows, that the value of his chance is the tenth part of 32*l.* 10*s.* viz. 3*l.* 5*s.* And consequently the purchaser of a chance, by giving the feller 3*l.* 5*s.*, is intitled to the chance of a benefit, and ought not to return any thing to the feller, although he should have a prize; for the feller having 3*l.* 5*s.* sure, and nine chances in ten for 7*l.* 10*s.* the value of which chance is 6*l.* 15*s.* it follows that he has his 10*l.* 5*s.*

PROB. VIII.

In the same kind of lottery, let A engage to furnish B with a chance, on condition that whenever the ticket on which the chance depends shall happen to be drawn, whether it proves a blank or prize, A shall furnish B with a new chance, and so on, as often as there is occasion, till the whole is drawn; it is proposed to find what consideration B ought to give A before the lottery begins to be drawn, for the chance or chances of one or more prizes, admitting that the lottery will be forty days in drawing.

Let the absolute value of a chance, or 3*l.* 5*s.*, be called *s.* First A, who is the feller, ought to consider, that on the first day he furnishes necessarily a chance whose value is *s.*

2dly. That on the second day, he does not necessarily furnish a chance, but conditionally, viz. if it so happen that the ticket on which the chance depends should be drawn on the first day; but the probability of its being drawn on the first day is $\frac{1}{40}$; and therefore he ought to take $\frac{1}{40}s.$ for the consideration of the second day.

3dly. That in the same manner he does not necessarily furnish a chance on the third day, but conditionally, in case the only ticket depending (for there can be but one) should happen to be drawn on the second; of which the probability being $\frac{1}{39}$, by reason of the remaining 39 days from the second inclusive to the last, it follows, that the value of that chance is $\frac{1}{39}s.$

4thly. And for the same reason the value of the next is $\frac{1}{38}s.$ &c. the purchaser ought, therefore, to give the feller $1 + \frac{1}{40}s. + \frac{1}{39}s. + \frac{1}{38}s. + \frac{1}{37}s. + \frac{1}{36}s. + \frac{1}{35}s. + \frac{1}{34}s. + \frac{1}{33}s. + \frac{1}{32}s. + \frac{1}{31}s. + \frac{1}{30}s. + \frac{1}{29}s. + \frac{1}{28}s. + \frac{1}{27}s. + \frac{1}{26}s. + \frac{1}{25}s. + \frac{1}{24}s. + \frac{1}{23}s. + \frac{1}{22}s. + \frac{1}{21}s. + \frac{1}{20}s. + \frac{1}{19}s. + \frac{1}{18}s. + \frac{1}{17}s. + \frac{1}{16}s. + \frac{1}{15}s. + \frac{1}{14}s. + \frac{1}{13}s. + \frac{1}{12}s. + \frac{1}{11}s. + \frac{1}{10}s. + \frac{1}{9}s. + \frac{1}{8}s. + \frac{1}{7}s. + \frac{1}{6}s. + \frac{1}{5}s. + \frac{1}{4}s. + \frac{1}{3}s. + \frac{1}{2}s. + \frac{1}{1}s. \times s.$ or $1 + \frac{1}{40}s. + \frac{1}{39}s. + \frac{1}{38}s. + \frac{1}{37}s. + \frac{1}{36}s. + \frac{1}{35}s. + \frac{1}{34}s. + \frac{1}{33}s. + \frac{1}{32}s. + \frac{1}{31}s. + \frac{1}{30}s. + \frac{1}{29}s. + \frac{1}{28}s. + \frac{1}{27}s. + \frac{1}{26}s. + \frac{1}{25}s. + \frac{1}{24}s. + \frac{1}{23}s. + \frac{1}{22}s. + \frac{1}{21}s. + \frac{1}{20}s. + \frac{1}{19}s. + \frac{1}{18}s. + \frac{1}{17}s. + \frac{1}{16}s. + \frac{1}{15}s. + \frac{1}{14}s. + \frac{1}{13}s. + \frac{1}{12}s. + \frac{1}{11}s. + \frac{1}{10}s. + \frac{1}{9}s. + \frac{1}{8}s. + \frac{1}{7}s. + \frac{1}{6}s. + \frac{1}{5}s. + \frac{1}{4}s. + \frac{1}{3}s. + \frac{1}{2}s. + \frac{1}{1}s. \times s.$ The sum of these forty terms, being 4.2785 nearly, multiplied by *s.* or 3.25, will give a product 13.9, shewing that the purchaser ought to give the feller about 13*l.* 18*s.*

From what has been said it appears, that the value of the chance *s.* for one single day that shall be fixed upon is the

value of that chance divided by the number of days intercepted between that day inclusive and the number of days remaining to the end of the lottery; which, however, must be understood with this restriction, that the day fixed upon must be chosen before the lottery begins; or if it be done on any other day, the state of the lottery must be known, and a new calculation made accordingly for the value of *s.* De Moivre's Doctrine of Chances, 1756. See also the article CHANCES.

LOTTERY is also the name of a well-known game at cards.

LOTTI, ANTONIO, of Venice, in *Biography*, principal organist of St. Mark, and afterwards maestro di cappella of the same cathedral, was one of the greatest men of his profession. The celebrated Haffé, his disciple and intimate friend, and the best able to judge of his abilities, thought that none of the great masters ever united in their works so great a share of expression and science. In his compositions, he combined with the learning of the old school all the grace, rich harmony, and brilliancy of the new. He was the hero of Haffé, who never spoke of him but with rapture. "What expression" (he used to say), "what variety, were in that expression, and what truth in the ideas!" How pleasing it was to hear a man at his time of life, of a merit and reputation above all envy, speak with such enthusiasm of a great master. Lotti was long at the head of the Venetian school. His ecclesiastical compositions were only used at St. Mark's on great and solemn occasions. They are truly sublime. The kind of pathos in his style elevates the soul, and expresses all the grandeur and reverence of devotion. (*Essais sur la Mus. tom. iii.*) This animated and feeling character of Lotti does not seem to come from an author who in general speaks of the Italians with contempt, and of Rameau as the only musician who ever knew harmony and how to use it. We can, however, answer for the truth of the above character. For though we have never heard or seen any of his dramatic music, yet, in 1770, we heard at Venice, in the church of San Giovanni e Paolo, on a day that the doge went in procession to that church, a mass by Lotti, in four parts, without any other instrument than the organ, which was so well sung and accompanied, that we do not remember ever to have received more pleasure from choral music; all was correct, clear, and distinct; no confusion or unnecessary notes; it was even capable of expression, particularly one of the movements into which the performers entered so well as to render it affecting even to tears. The organist, very judiciously, suffered the voices to be heard in all their purity, with which our attention was so occupied, that we frequently forgot that they were accompanied. This kind of music, à cappella, though exploded as unfit for theatrical purposes, must be allowed to have its merit. Lotti was the disciple of Legrenzi, the model of Haffé, one of the masters of Marcellò, Galuppi, and Pavesetti. His name is chiefly known in England by the dispute in the Academy of Ancient Music, at the Crown and Anchor, in 1732, concerning a madrigal which Bononcini was accused of having stolen from him. See BONONCINI.

Lotti composed for the Venetian theatres, between the years 1698 and 1717, fifteen operas. His cantatas furnish specimens of recitative that do honour to his sensibility. He was opera composer at the court of Dresden when the Santa Stelli, his wife, performed the part of first woman then, in 1718; and in 1720 he returned to Venice, where he was living in 1733.

LOTUL, in *Geography*, a town of Bengal; 16 miles W. of Torea.

LOTUS, in *Botany*, a name which has been more variously

usually applied, and of which perhaps more has been written, than of any other plant. Those who have sought for its origin in the Greek language, have found nothing nearer than *λωτός*, to *will* or *desire*, alluding, as they suppose, to the plant being greatly esteemed. Others have thought, with more probability, that *λωτός* of the Greeks, and *Lotus* of the Latins, had one common Egyptian origin, its etymology being therefore, of course, inscrutable to us. All that can be said of the application of this name, at various times, and in various languages and nations, is, that it has always been used for some plant eminently useful as food, for man or beast. Thus it has been appropriated to the *κνυμὸς*, or Sacred Bean of India (see *CYANTUS*); and to its Egyptian substitute, the *Nymphaea*; to some African fruit, on which certain people have chiefly depended for their support; and to several herbaceous plants, essential to the maintenance of domestic cattle, in countries sparingly furnished with grass. In this last sense it is finally retained, as a generic appellation, by modern botanists.—Linn. Gen. 388. Schreb. 509. Willd. Sp. Pl. v. 3. 1385. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 793. Ait Hort. Kew. ed. 1. v. 3. 90. Juss. 356. Lamarck. Illustr. t. 611. Gärtn. t. 153.—Class and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceae*, Linn. *Leguminosae*, Juss.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, tubular, nearly cylindrical, cut half way down into five, acute, erect teeth, equal in length, but not quite uniform in position, permanent. *Cor* Papilionaceous. Standard roundish, bent backwards; its claw long, concave. Wings roundish, shorter than the standard, broad, slightly cohering by their upper margin. Keel gibbous beneath, closed above, pointed, ascending, short. *Stam.* Filaments in two sets, one simple, the other in nine segments, ascending, rather dilated at the tips; anthers small, simple. *Pist.* Germen oblong, straight, nearly cylindrical, rarely angular; style simple, ascending; stigma a small inflexed point. *Peric.* Legume cylindrical, straight, tardid, longer than the calyx, of one cell and two valves. *Seeds* several, somewhat cylindrical.

Ess. Ch. Legume cylindrical, straight. Wings cohering longitudinally above. Calyx tubular. Filaments dilated upwards.

The habit of this genus, mostly herbaceous, in some instances slightly shrubby, approaches that of *Medicago*, but their fructification differs essentially. The species chiefly abound in the more temperate climates of Europe, or part of Africa. Seventeen occur in the *Sp. Pl.* of Linnæus, 18 in *Syst. Veg.* ed. 14; 30 in Willdenow. Three are reckoned natives of Britain, all confounded till lately under *L. corniculatus*.

The whole are distributed into two sections.

SECT. 1. *Flowers, or Legumes, one or two on a stalk, rarely three.* Of these some of the principal are

L. filiquosus. Square-podded Bird's-foot Trefoil. Linn. Sp. Pl. t. 89. Jacq. Austr. t. 361. (*L. tetragonolobus*; Rivin Tetrap. Irr. t. 79. *L. trifolia corniculata*; Ger. em. 1198.)—Legumes solitary, with four membranous wings. Stems procumbent. Bractæas lanceolate, solitary or ternate.—Native of rather moist pastures, in various parts of the continent of Europe from Sweden to Italy, but not found in Britain. The roots are perennial, throwing up many weak decumbent stems, about a span long, branching, zigzag and leafy. Leaves alternate, stalked, ternate; leaflets obovate, equal in length, but the two lateral ones very unequally divided by their rib; all somewhat fleshy, more or less hairy, slightly glaucous beneath. *Stipulas* in pairs at the base of each footstalk, large, ovate or elliptical. *Flower-stalks* few, axillary, solitary, about the tops of the

stems, which they greatly overtop, being often three or four inches long, firm, hairy, single-flowered. *Flowers* large, lemon-coloured. *Legume* an inch and half long, with four narrow wings.—Linnæus's *L. maritimus* is not even a variety of this. He seems at one time not to have been clear in his ideas respecting *filiquosus* and *tetragonolobus*.

L. tetragonolobus. Crimson Winged-Pea. Linn. Sp. Pl. 1089. Curt. Mag. t. 151. (*L. filiquâ quadratâ*; Ger. em. 1198.)—Legumes solitary, with four membranous wavy wings. Stems spreading. Bractæas ovate, ternate.—Native of Sicily and Spain. Very commonly cultivated as a hardy annual, for the sake of its deep-crimson, velvety flowers, and sometimes for its pods, which when young are occasionally eaten boiled, as greens. It is also celebrated in botanic history, as having first called the attention of Linnæus to the sleep of plants. He observed that its flowers became invisible in the evening, by being enfolded in their bractæas, and re-appeared in the morning, which led him to consider this subject, and to write upon it.

We have some specimens, belonging to this section, which appear to be new species, or very remarkable varieties, gathered at Algiers by M. Durand.

L. diffusus perhaps should be removed hither; see the end of the genus.

SECT. 2. *Flowers many together in a head.*

L. hirsutus. Hairy Bird's-foot Trefoil. Linn. Sp. Pl. 1091. Curt. Mag. t. 336.—Heads roundish. Stem hairy. Legumes somewhat ovate.—Native of the south of Europe and the Levant; long known in our gardens, where it requires the shelter of a greenhouse. The stem is shrubby, often four or five feet high, hairy like the leaves and stipulas. *Flowers* white, or bluish-coloured, prettily contrasted with their red calyx. The legumes, though truly cylindrical, are so short as to become almost ovate. On the sea beach of the Genoese coast, this species grows prostrate, enlivening the stony ground with a profusion of blossoms; so that the Linnæan definition, "stem erect," is not in all cases exact.

L. corniculatus. Common Bird's-foot Trefoil. Linn. Sp. Pl. 1092. Curt. Lond. fasc. 2. t. 56. Mart. Rust. t. 53. Engl. Bot. t. 2090.—Heads depressed, of few flowers. Stems decumbent, solid. Legumes spreading, nearly cylindrical. Claw of the keel obovate. Filaments all dilated.—Native of most parts of Europe; very common with us in open grassy pastures, where it is conspicuous in autumn. The stems spread, from the perennial root, in every direction, various in length, simple or branched, angular, leafy, clothed with close-pressed hairs. *Flowers* of a golden yellow, more or less stained or striped with dark red, each head on a long stalk, with a small ternate bractæa at the top. *Legumes* of a shining brown, or copper-colour.—This has been recommended for fodder and hay, by the name of Milk-vetch.

L. major. Greater Bird's-foot Trefoil.—Scop. Carn. v. 2. 86. Engl. Bot. t. 2091. (*L. corniculatus* γ et δ; Fl. Brit. 794.)—Heads depressed, many-flowered. Stems erect, hollow. Legumes spreading, cylindrical. Claw of the keel linear. Shorter filaments not dilated. Found in wet boggy places, among bushes and reeds, flowering in summer and autumn, probably throughout Europe. Its more erect, hairy habit, and larger size, mark this plant sufficiently to a common observer, and the above characters are abundantly sufficient to distinguish it from the last, with which it has generally been confounded.

L. diffusus. Slender Bird's-foot Trefoil. Fl. Brit. 794. Engl. Bot. t. 925. (*L. pentaphyllos minor hirsutus*, filiquâ angustissimâ; Bauh. Pin. 332. *Trifolium corniculatum minus*, pilosum; Bauh. Prodr. 144.)—Flower-stalks mostly single-flowered. Stem much branched, prostrate. Leaves and

and calyx hairy. Legumes round, linear, very slender.— Native of Madeira, and of the south coast of England. It has an affinity to the two last, but is more delicate and slender, with smaller and paler flowers, one or two only together; for which reason it ought to be placed in the first section, though it proves such a division of the genus (by the number of its flowers) to be rather artificial than natural.

The lotus of Africa is rather a thorny shrub than a tree; and it abounds in all those parts of Africa through which Mr. Park travelled; but it flourishes most in a sandy soil. Its fruit is a small farinaceous berry, about the size of an olive; which being pounded in a wooden vessel, and afterward dried in the sun, is made into excellent cakes, resembling, in colour and flavour, the sweetest gingerbread. The natives of all descriptions esteem it highly, and some of them prepare from it a liquor deliciously sweet; the same perhaps which is fabled to have produced such extraordinary effects on the companions of Ulysses.

Lotus, in *Gardening*, comprizes plants of the herbaceous and under shrubby kind, of which the species cultivated are, the winged bird's-foot trefoil (*L. tetragonolobus*); the dark-flowered bird's-foot trefoil (*L. jacobaeus*); the silvery bird's-foot trefoil (*L. hirsutus*); and the shrubby bird's-foot trefoil (*L. Dorycnium*).

Method of Culture.—The first sort is raised by sowing the seed annually in the spring, in the open ground, in the places where the plants are to remain, in patches in different parts, of five or six seeds in each, half an inch deep. The plants soon come up, which remaining in the same place for flowering, require only occasional weeding, being either suffered to trail, according to their natural growth, or tied up to sticks.

The other sorts may be increased by seeds and cuttings. The seeds should be sown in pots of light earth or in a moderate hot-bed; and when the plants are about three inches high be planted out in separate small pots of light rich earth, giving water, and placing them in the shade till fresh rooted.

The cuttings of the young stalks and branches may be planted any time in the spring or summer, in beds or pots of rich mould, giving shade and water. They emit roots, and form plants in a few weeks, but may be greatly facilitated by covering them close with hand-glass till they begin to shoot at top; then they should be gradually inured to the air, and soon after be transplanted into separate pots.

The first of these plants is now chiefly cultivated in flower-gardens for ornament, but was formerly grown for the green-pods which were boiled and eaten.

The other kinds effect an agreeable variety in collections of green-house plants, both in their foliage and flowers. They all require shelter from frost, the two first in particular; the two last are somewhat hardier, and sometimes succeed in the full ground all the year, in warm dry situations. A few plants should however constantly be kept in the pots, to be protected in the winter season.

Lotus, *Bladder*. a name sometimes given to a species of *vulneraria*, or *anthyllis*.

Lotus Corniculatus: this is a plant that has a perennial tapering root which strikes deep; there are several trailing herbaceous stems, slender, bluntly four-cornered, procumbent except where supported, as in meadows or among bushes, from six or seven inches to a foot and a half in length; varying even more in different soils and situations. The leaves are ternate, petioled, one at each joint, the leaflets differing extremely in form, in the several varieties, from bluntly ovate to linear-lanceolate. The stipules resemble the leaves,

but they are more pointed, and are rather lanceolate than ovate. The flowers grow in flattened heads resembling umbels, on peduncles from two to three inches and a half in length, but on pedicles hardly a line long. There is a single sessile ternate leaf at the base of each head without any stipules; and sometimes there is only one leaflet or two; the number of flowers varies from three or four to twelve or thirteen.

This sort of lotus is found in meadows, pastures, and heaths, flowering in June. It is said to be cultivated in Hertfordshire as pasturage for sheep; and it makes extremely good hay; growing in moist meadows to a greater height than the trefoils, and seems to be of a quality equal, if not superior to most of them. In common with several other leguminous plants, it gives substance to the hay, and perhaps contributes to render it more palatable and wholesome for cattle. Dr. Anderson affirms, that every sort of domestic animal eats it in preference to every other plant: it seldom comes to flower in pasture grounds, unless where they have been fayed from cattle for some time. What first recommended it to his notice was, the having observed it to grow and flourish in poor ground; as in the midst of a barren moor, where the soil was so poor that even heath could hardly grow; upon bare obdurate clays; in dry and barren sands. It certainly flourishes not only in these, but also chalky soils; and on moors, heaths, and downs hard stocked with sheep, the surface may be seen to be yellow with the flowers of it; which is contrary to what has been asserted above, namely, that it seldom comes to flower in pastures. But a greater number of trials are still wanting to fully ascertain the utility of this plant for field purposes, though it certainly promises well.

Lotus Glycycalemus, a name given by the ancient Greeks to an Egyptian plant according to some, and according to others, to a rare plant, found only in few places, and only met with by accident, by the people who made long and uncommon voyages. The whole account given of it, by the earliest writers, is no more than that it was of a very sweet and pleasant taste. Myrepsus uses the term frequently, and his interpreters understand him to mean the cassia fistula by it. But we have accounts from Homer, that the followers of Ulysses were detained by eating the lotus glycycalemus; and it is not at all probable that the cassia fistula could be the thing meant by the word in this place; neither will the words of the author allow it to be any thing of this kind. The cassia fistula is the fruit of a tree: but this glycycalemus, we find in Homer himself, was an herbaceous plant. Quintilian calls it expressly a kind of grass, gramen; and from the other accounts of its growing in form of reeds, and in wet places, it seems very probable that it was the sugar-cane that they called by this name.

Lotus, in *Agriculture*, a sort of plants of the bird's-foot trefoil kind, of which there are several species, some of which may be cultivated for the purpose of cattle food with advantage.

LOTZEN, in *Geography*, a town, with a castle, of Prussia, in the province of Natangen, seated on a canal which joins the Angerburg and Leventin lakes: 56 miles S.E. of Königsberg. N. lat. 53 53. E. long. 21 57'.

LOVA, a town of Hungary; 20 miles W. of St. Crot.

LOVAGE, in *Botany and Gardening*. See **LIGUSTICUM**.

LOVAGE. *Bastard*. See **LASERPIITIUM filix**.

LOUAR, in *Geography*, a town of Hindoostan, in Dowlatabad; 10 miles W.N.W. of Kondur.

LOVAT, a town of European Turkey, in Bulgaria; 64 miles E. of Sofia.

LOVATINI, **GIOVANNI DI RAVENNA**, in *Biography*, a burletta

a burletta finger, with the sweetest tenor voice and style of singing we ever heard on any stage. He arrived in England in the autumn of 1766, with Morigi, Savoi, Micheli, La Guadagni, Piatti, and Gibetti.

This excellent troop appeared December 9th, for the first time, in our lyric theatre, in the admirable comic opera "La Buona Figliuola," written by Goldoni, and set by Piccini. The performance and success of this burletta were complete, and rendered the name of Piccini, which had hardly penetrated into this country before, dear to every lover of music in the nation. All the performers in this drama established a character which was of use to them during the rest of their lives.

Lovatini's mellifluous voice, manner of singing, and humour; La Guadagni's graceful figure, acting, and singing; Morigi's mimicry of the pronunciation, accent, and manner of a German soldier; Savoi's fine voice, the characteristic manners of the two prating female domestics, Piatti and Gibetti; and even the raven-like croak of Micheli, had its share of notice; but whoever remembers the elegant cantabile style in which Lovatini began the charming duet, "La Baronesse Amabile," must retain an exalted opinion of his captivating powers in *serious* singing.

Lovatini, when he quitted this country for his own in 1774, merely retired to die, as news of his death arrived here the next year, and we cannot discover that he performed in any other theatre after he left England.

LOVATOVA, in *Geography*, a town on the E. coast of the island of Flores. S. lat. 8° 30'. E. long. 122° 50'.

LOUBENS, a town of France, in the department of the Upper Garonne; 12 miles N.W. of Revel.

LOUBERE, SIMON DE LA, in *Biography*, was born at Toulouse in 1642. He studied at the Jesuits' college, and displayed a good poetical taste by a multitude of light compositions, though he was far from neglecting more serious pursuits, and particularly attended to politics and public law. He commenced his political career as secretary to M. de St. Romain, ambassador to Switzerland. In 1687, he was appointed by Lewis XV. his envoy extraordinary to the court of Siam, where he remained only about three months, during which he collected a large store of information concerning its natural and civil history, the religion, manners, &c. of the people. On his return, he published an account of what he had observed, in two vols. 12mo. which became a very popular work. He was afterwards sent without a public character into Spain, on a secret commission, but was arrested, and obtained his release only in consequence of reprisals on some Spaniards in France. In 1693 he was elected into the French academy, and soon afterwards retired to his native city, where he re-established the "Floral Games," which had sunk into decay. He died at the very advanced age of eighty-seven, in the year 1729. He was a man of very general knowledge, well acquainted with several languages ancient and modern, and excelled as a writer in various branches of literature. Moreri.

LOUBES, Sr., in *Geography*, a town of France, in the department of the Gironde; 12 miles N.E. of Bourdeaux.

LOUBIERE, a town of the island of Dominica, on the W. coast; 17 miles S. of Portsmouth.

LOUBO, a town of Benin, at the mouth of the river Tormosa; 60 miles S.W. of Benin.

LOUBOUEX, Sr., a town of France, in the department of the Landes; nine miles S.E. of St. Sever.

LOUBRESSAC, a town of France, in the department of the Upper Loire; six miles N.W. of Le Puy en Velay.

LOUCHOU, a town of Persia, in the province of Mazanderan; 45 miles N.E. of Casbin.

LOUDEAC, a town of France, and principal place of a district, in the department of the North Coasts; in which are an iron forge and a manufacture of thread; 20 miles S. of St. Brienc. The place contains 6096, and the canton 14,611 inhabitants, on a territory of 205 kilometres, in six communes. N. lat. 48° S. W. long. 2° 40'.

LOUDES, a town of France, in the department of the Upper Loire, and chief place of a canton, in the district of Le Puy; six miles N.W. of Le Puy. The place contains 800, and the canton 5377 inhabitants, on a territory of 175 kilometres, in nine communes.

LOUDON, a county of Virginia, in America, on the river Potomac, adjoining Fairfax, Berkley, and Fauquier counties; about 50 miles long and 20 broad, containing 15,533 free inhabitants, and 4090 slaves. Its chief town is Leesburg. Quarries of grey stone, white flint, and lime are found in this county. The climate is favourable to apples, pears, peaches, plums, cherries, and grapes. The county was first settled from Pennsylvania and New Jersey.—Also, a township in Rockingham county, New Hampshire, taken from Canterbury, and incorporated in 1773; situated E. of the Merrimack river, and containing 1279 inhabitants.—Also, a township in Berkshire county, Massachusetts; 21 miles S.E. of Lenox; incorporated in 1773, and containing 614 inhabitants, and 13,000 acres, of which 2944 are ponds.

LOUDUN, a town of France, and principal place of a district, in the department of the Vienne, situated on an eminence between the Creuse and the Dive; 12 miles E. of Thouars. The place contains 5138, and the canton 11,299 inhabitants, on a territory of 245 kilometres, in 18 communes. N. lat. 47°. E. long. 0° 10'.

LOVE, in *Ethics*, is one of the primitive passions; and may be generally defined to be the gravitation or tendency of the soul toward good. According to Dr. Hartley, who traces all our passions to the sources of pleasure and pain, they may be first and generally distributed into the two classes of love and hatred; *i. e.* we may have all those affections of the pleasurable kind, which objects and incidents raise in us, love, and all those of the painful kind, hatred. Thus we are said to love not only intelligent agents of morally good dispositions, but also personal pleasures, riches, and honours, and to hate poverty, disgrace, pain, bodily and mental. When our love and hatred are excited to a certain degree, they put us upon a variety of actions; and may be termed desire and aversion, by the latter of which Dr. Hartley understands active hatred.

If the affection of love be conceived separate from any alteration in the body, it is called intellectual or rational love; if it be attended with an agitation of blood and spirits, it is called sensitive or passionate love. It is observed by moral writers, that those passions in which love predominates, are more agreeable to the original intention of nature than those which are ranged under hatred; because they are found to have a more friendly influence upon the body, and tend, within proper bounds, to the preservation and happiness of life, which the others do not. See Cumberland de Leg. Nat. c. 2. § 19.

Love, regarding its object as absent, begets desire; as present, either immediately or in prospect, joy and hope. Love of desire, abstractedly considered, is a simple tendency towards good; when considered as wishing the good desired to some being or other, it is called *benevolence* and *self-love*. See PLEASURE and PAIN, and PASSION.

Love inspires music and poetry. This was a memorable maxim

maxim among the Greeks, and the subject of one of Plutarch's symposiasts. See SCOLTA and SONG.

LOVE, in its usual and more appropriate signification, denotes that affection, which, being compounded of intellectual and sensitive love, or of animal desire, esteem, and benevolence, becomes the bond of attachment and union between individuals of the different sexes; and makes them feel in the society of each other a kind of happiness which they experience no where else.

LOVE, *Family of*. See FAMILY.

LOVE, *Platonic*. See PLATONIC.

LOVE *Apple*, is the English name for the fruit of the lycopersicon, a plant cultivated in gardens with us, for the singularity of its appearance. The Portuguese call it tomato, and eat the fruit, either raw or stewed: as do the Jew families in England. See SOLANUM *Lycopersicum*.

LOVE-GRASS. See GRASS.

LOVE in a *Mist*. See PASSION Flower.

LOVE lies Bleeding. See AMARANTHUS.

LOVE, *Tree of*. See CERCIS.

LOUE', in *Geography*, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of Le Mans; 15 miles W. of Le Mans. The place contains 1204, and the canton 12,563 inhabitants, on a territory of 245 kilometres, in 16 communes.

LOVELL, a town of America, in York county, Maine, N. of Great Offsee, 89 miles N. of York.

LOVENTINUM, or LUENTINUM, in *Ancient Geography*, a town of the Demetæ, in Britain, supposed by some, without sufficient reason, to have been swallowed up by an earthquake in the site of the present Llyn Savanathan, near Brecknock, but by others, with great probability, to have been situated at or near Llan-Dewi-Brevi, in Cardiganhire; where, in a field called Caer Castell, or Castlefield, Roman coins and bricks are sometimes found.

LOVERANO, in *Geography*, a town of Naples, in the province of Otranto; five miles N.N.E. of Nardo.

LOVESKAIA, a town of Russia, on the Caspian sea; 27 miles S.E. of Astrachan.

LOUGHABER, or LOCHABER, a small settlement in Georgia, on a branch of Savannah river, above its confluence with the Tugalo.

LOUGHBOROUGH, a market town and parish in the hundred of West Gosport, and county of Leicester, England, is situated 12 miles distant from the

county town, and 108 miles from London, on the banks of the river Soar, over which it has a good stone bridge. According to its size and population, it may be esteemed the second town in the county. Leland says, "The town of Loughborow is yn largeness and good building next to Leycester, of all the markette townes yn the shire, and hath in it a four faire strates or mo, well paved. The paroch church is faire. Chapelles or churches besides, yn the towne, be none. The hole towne is builded of tymbre. At the southest end of the church is a faire house of tymbre, wher ons king Henry VII. did lye." Loughborough, which consists of one parish, to which belong the two hamlets of Woodthorpe and Knightthorne, both about a mile distant; each having its proper officers and maintaining its own poor. Great part of the town is the property of the earl of Moira, to whom it came from his uncle the late earl of Huntingdon, in whose family it has been since the time of queen Mary. The church is a large pile of building, consisting of a nave, side aisles, chancel, transept, and tower; the latter was built by subscription, towards the end of the sixteenth century. In the church-yard is a free grammar school, which was endowed with the rents of certain lands, &c. left by Thomas Burton for the maintenance of a chantry within the church. Here is also a charity school for eighty boys and twenty girls. Four meeting-houses are appropriated to the Presbyterians, Baptists, Quakers, and Wesleyan Methodists. On the site of an old cross, a modern market-house, or what is called the butter and hen cross, was erected in 1742; it is supported by eight round brick pillars. At the upper end of the market place stands a ruinous brick edifice, called the court chamber, where the lord of the manor's courtleet is annually held. The building appears to have been erected in 1688; it is sometimes used as a theatre and ball-room. The town suffered severely by the plague at various periods in the sixteenth and seventeenth centuries. Under the act of 1800, the population was returned as 4546, inhabiting 981 houses. The chief manufactures carried on here are hosiery, wool-combing, and frame work knitting.

Six annual fairs are held, and a weekly market on Thursdays. In the year 1776, the town contained 43 licensed inns and alehouses; in 1783, the number exceeded 50.

The Loughborough canal, which communicates with that called the Union canal, and with the river Soar, has proved very serviceable to this town, and an advantageous concern to the original proprietors; as 95l a-year dividend has been paid on a share of 125l; and one of these shares has been sold for 1800l. Nichol's History of Leicestershire.

LOUGHBOROUGH, a township of Upper Canada, in Frontenac county, N. of Kingston.

LOUGHBOROUGH Canal, an inlet on the W. coast of North America, in the gulf of Georgia, about 30 miles long, and one broad, between mountains nearly perpendicular. The entrance is in N. lat. 50° 27'. E. long. 234° 35'.

LOUGHBURCKLAND, a post-town of Ireland, in the county of Down, on the road to Belfast. It is 58 miles north from Dublin, and 22 from Belfast.

LOUGHGALL, a small post-town of Ireland, in the county of Armagh; it is 66 miles N. from Dublin, and three miles N.N.W. from Rickhill.

LOUGHREA, a post-town of Ireland, in the county of Galway. It is situated on a fine lake of the same name, and is 87 miles W. by S. from Dublin.

LOUHANS, a town of France, and principal place of a district, in the department of the Saône and Loire, situated at the conflux of the Seille and Sohan. The French

French and Swiss merchants have been accustomed to meet here for the purposes of commerce. The place contains 2840, and the canton 12,221 inhabitants, on a territory of 140 kilometres, in 10 communes; 15 miles S.E. of Châlons sur Saône. N. lat 46° 38'. E. long. 5° 18'.

LOUCHEA CERVINA, in *Botany*, so named by l'Heritier, in honour of his countryman M. René Louiche Desfontaines, M.D. Professor of Botany at Paris, in a monograph of which 12 copies only were printed; see **HERITIER**. The plant was afterwards discovered to be *Pteranthus* of Forskall; so that it appeared in l'Heritier's *Stirpes Novæ*, t. 65, under the appellation of *Louichea Pteranthus*. It is indeed the *Camphorospha Pteranthus* of Linnæus, *Plant* 41; see **CAMPHOROSMA**. If any future botanist should determine this plant to be a distinct genus, it must retain the name of *Pteranthus*; not only for the sake of its aptitude and priority, but because another genus is now consecrated to the honour of M. Desfontaines. See **FONTANESIA**.

LOVIGNANO, in *Geography*, a town of Naples, in the province of Otranto; 12 miles S.S.W. of Brindisi.

LOUIS XII. of France, in *Biography*. See **JOSQUIN DU PRÉS**.

LOUIS XIII. This prince (see **LEWIS**), who began his reign in 1610, at only six years old, is said to have been not only a lover and encourager of the art of music in riper years, but to have composed several airs with the assistance of Beauchamp, his first violin, who made the base. *Recueil d'airs de cour*.

Père Merfenne, Kircher, and later musical writers, have given, as a specimen of his invention, an air for a grand dance, in 1618, before he was fifteen years old. *Les vingt quatre violons du roi* subsisted in the time of Henry IV.; but these seem only to have been employed for dancing. The lute was more an instrument of parade in these times than any other; and in 1609, Mary de Medicis, Henry IVth's second queen, was followed in a grand dance by twelve lutes, led by Ballard, the principal lutenist of the court: and all the numerous collections of the court airs at this time were printed in the lute tablature, or notation, to which they were set by the authors of the tunes themselves. The most minute and satisfactory account of the state of music in France, during the reign of Louis XIII. is to be found in the writings of Père Merfenne, particularly in his "Harmonie Universelle," published at Paris in 1636, in folio, a work which he afterwards compressed, and translated into Latin, and published in 1648, the year of his death, under the title "De Sonorum Natura, Causis et Effectibus." A work in which, through all the partiality to his country, want of taste and method, there are such innumerable curious researches, and ingenious and philosophical experiments, of which subsequent writers on music have availed themselves, particularly Kircher, as render the book extremely valuable. In his twenty-third proposition, liv. i. this author explains and describes twelve different kinds of music and movement used in France during his time: these were motets, songs or airs, passacailles, pavans, allemandes, gaillards, voltes, courantes, farabandes, canaries, branles, and balets, of all which he gives examples in notes. But though most of these movements were the specific names of the dances then in vogue, the minuet, which, during the last century, was in such general use and favour all over Europe, is never mentioned.

LOUIS XIV. This magnificent prince (see **LEWIS**), whose ambition was not confined to extension of empire, seems to have patronised music, and to have established an opera in his capital, more as a splendid spectacle, which no other sovereign could afford to support, than from the pleasure which he

received from modulated sound. He was, however, during his minority, taught the guitar by an Italian, whom cardinal Mazarin sent for expressly from Italy; but as the actions and faculties of this young monarch were to be regarded as wonderful, he is said by his flatterers, in eighteen months to have excelled his master (*Hist. de la Mus.*), and to have understood music in perfection. Indeed, the first dramatic music which he heard was Italian; as cardinal Mazarin, during the minority of this prince, had two operas in Italian verse, and set to Italian music, performed by a company of Italian singers sent from Italy, to impress the court of France with a favourable idea of the fashionable music of his country. The first of these operas, performed at the Bourbon palace in 1645, seems to have been a burletta. Its title was "La Festa Teatrale della Finta Pazzo," written by Giulio Strozzi, but by whom set does not appear. The second was "Orfeo ed Euridice," 1647. Besides these, at the nuptials of Louis XIV. 1660, "Ercole Amante," a serious Italian opera, was performed in the same manner, and well received at court by the flatterers of the cardinal, says the continuator of Bonnet's History of Music. M. de Blainville, however, in his short History of Music, says, that he had seen the score of this opera, "and found, in examining it, all the recitatives, airs, choruses, symphonies, and dances, both in melody and harmony, of the same kind as those of Lulli." And at the time that Lulli came into France, 1646, the opera in Italy had made but a small progress towards that perfection at which it afterwards arrived. It then consisted chiefly of recitative with frequent closes, *ad libitum*, and choruses, but no airs or measured melody for a single voice. And in this state the opera continued in France till the death of Rameau, and arrival of Gluck and Piccini at Paris; while in all the capitals of Italy and Germany, melody was polished, taste refined, modulation extended, and harmony enriched by new combinations. Whatever horror and hatred the ambition of Louis might have excited in his neighbours, and envy by his magnificence, his most bitter and irreconcilable enemies must have allowed that music was the only one of all the arts and sciences which was not successfully cultivated in France, during the prosperous part of his long and splendid reign. Indeed the failure of music was not so much owing to want of genius and love of the art in the natives, as to the nasal tones and natural cantilena of their language; nor would the rest of Europe have so disliked, censured, and condemned their music, if they had not at all times insisted on its being the best in the universe, and the model which all other nations ought implicitly to follow.

LOUIS, ANTHONY, an eminent French surgeon, was born at Metz on the 13th of February 1723. He attained to great reputation in his profession, and was honoured with numerous appointments and offices, the just rewards of his merit. He was secretary of the Royal Academy of Surgery at Paris, consulting surgeon to the king's forces, surgeon-major to the hospital La Charité, doctor in surgery of the faculty of Halle, in Saxony, honorary member of the Royal College of Physicians of Nancy, and member of many of the learned societies, not only in France, but in foreign countries. The time of his death is not known, but the latest of his publications is dated in 1777. In addition to the surgical part of the "Encyclopédie," which M. Louis wrote, and to several interesting papers presented to the Academy of Surgery, he was author of a great number of works on medical, surgical, and anatomical subjects, the principal of which we shall mention. "Observations sur l'Électricité," &c. Paris, 1741, 12mo: "Essai sur la Nature de l'Âme, où l'on tâche d'expliquer son union avec le corps," *ibid.* 1746, 12mo: ;

12mo.: "Cours de Chirurgie pratique sur les plaies d'armes à feu," *ibid.* 1746, 4to.: "Observations et Remarques sur les effets du virus cancreux," &c. *ibid.* 1748: "Positiones Anatomico-chirurgicæ de capite ejusque vulneribus," *ibid.* 1749: "Lettre sur la certitude des signes de la mort, avec des observations et des expériences sur les noyés," *ibid.* 1749, 12mo. He attributed the death of persons drowned to the entrance of water into the lungs, which farther experience has disproved. "Expériences sur la Lithotomie," 1757, in which he expressed his disapprobation of the bistouri caché of Frère Côme. "Mémoire sur une question anatomique, relatif à la jurisprudence," &c. 1763. This memoir, written after the shocking affair of Calas, was intended to establish the distinction of the appearances after voluntary death by hanging, and after murder by that mode. "Mémoire sur la légitimité des naissances prétendues tardives," 1764, in 8vo; in which the author maintains that the retardation of parturition beyond the natural period of gestation, *i. e.* more than ten days beyond the ninth month, is physically impossible. He published a supplement to this treatise in the same year. "Recueil d'Observations d'Anatomie et de Chirurgie, pour servir de base à la Théorie des lésions de la tête par contrecoup," 1766: "Histoire de l'Académie Royale de Chirurgie depuis son établissement jusqu'en 1743," printed in the fourth volume of the memoirs. His last publication was a translation of M. Astruc's work "De Morbis Venericis," into French. In addition to these works, M. Louis also translated Boerhaave's Aphorisms of Surgery, with Van Swieten's Commentary; and wrote several eulogies on deceased members of the Academy of Surgery, and various controversial tracts, especially concerning the disputes between the physicians and surgeons of Paris in 1748 &c. Eloy Dict. Hist. Gen. Biog.

LOUIS, Lewis, Louis d'or, or Lewidore, a French coin, first struck in 1641, under the reign of Louis XIII. and which has since had a considerable currency.

Louis d'ors, at first, were valued at ten livres, afterwards at eleven, and at length at twelve and fourteen. In the latter end of the reign of Louis XIV. they were risen to twenty, and in the beginning of that of Louis XV. to thirty and thirty-six, nay forty and upwards; with this difference, however, that in the last coinings the weight was augmented in some proportion to the price, which in the former reign was never regarded. The Louis d'ors coined before 1726, which then passed for 20 livres, were coined at the rate of $36\frac{1}{2}$ per French mark of gold, 22 carats fine: the remedy in the weight was 14 grains per mark, and the remedy in the alloy one-fourth of a carat. These ceased to be a legal coin in France as far back as 1726; but they still continued to circulate through many parts of Germany and Switzerland, where they had a fixed value, and were known by the name of "Old Louis d'ors:" of these few are now in circulation. From the year 1726 to 1785, Louis d'ors were coined at the rate of 30 to the mark of gold, 22 carats fine, with a remedy of 15 grains in the weight, and $\frac{1}{2}$ of a carat in the alloy. Accordingly before 1786, the double Louis weighed 10 dwt 11 gr. contained in pure gold 224.9 gr. and was valued at 1*l.* 19*s.* 9*d.* sterling: the Louis weighed 5 dwt. 5 gr. contained in pure gold 112.4 gr. and was valued at 19*s.* 10*d.* sterling: and the demi-louis weighed 2 dwt. 14 gr. contained in pure gold 56.2 gr. and was valued at 9*s.* 11*d.* sterling. These coins ceased to be current in France in 1786. In Holland, Germany, &c. they were called "New Louis d'ors," by way of distinction from those which we have before mentioned; though these are now become the old ones. The intrinsic value of such a Louis d'or (making the full allowance for

remedy) is very little more than a pound sterling. In 1785 and 1786, all the gold coins in France were called in and ordered to be melted down; and a new coinage took place, at the rate of 32 Louis d'ors to the mark of the same degree of fineness, with the same allowances for remedy as above. Accordingly, the double Louis coined since 1786, weighed 9 dwt. 20 gr. contained 212.6 gr. of pure gold, and was valued at 1*l.* 17*s.* 8*d.* sterling: the Louis weighed 4 dwt. 22 gr. contained of pure gold 106.3 gr. and was valued at 18*s.* 10*d.* sterling. The intrinsic value of this new Louis d'or (allowance being made for remedy) is 18*s.* 9*d.* sterling; and 1*l.* sterling = 25 livres, 10 sous Tournois, in gold. Louis d'ors may be considered as a current coin in most parts of the continent; but in England they are sold merely as merchandize, and their price has fluctuated from 18*s.* 6*d.* to 21*s.* sterling.

On one side of the coin is the king's head, with his name and title, thus: LUD. XVI. D.G. FR. ET NAV. REX. *i. e.* Louis XVI. king of France and Navarre; on the reverse, the arms of France and Navarre, with a crown over them. On the pieces coined before 1786, there are two distinct shields; and on those coined since 1786, a double shield: the legend is, CHR. REGN. VINC. IMPER. *i. e.* Christ reigns, conquers, governs: under the arms is a letter, by which the mint where the piece was coined is distinguished. The double and half Louis bear the same impression.

There are also white Louises, or Louis d'argent, some of 120, others of 60 sols a piece, called also ecus; and among us French crowns, half-crowns, &c. The old ecus, coined before 1726, were coined at the rate of 9 pieces to the mark of 10 deniers 22 grains fine: these, like the Louis d'ors of the same period, after they had ceased to be current in France, still preserved a fixed value in some parts of Germany; but they are now scarcely in circulation. In 1726, the coinage of ecus was regulated, and continued without alteration, as follows: $8\frac{1}{2}$ ecus of 6 livres, or 16*½* ecus of 3 livres, were to be coined from a mark of silver 11 deniers fine, with a remedy of 36 grains per mark in the weight, and $\frac{1}{8}$ of a denier in the alloy: and their intrinsic value is (allowance being made for remedy) 4*s.* 9*d.* sterling; or, 1*l.* sterling = 25 livres, 3 sous Tournois, in silver.

On the one side of these is the king's head, and on the other the French arms, with this legend, "Sit nomen Domini benedictum."

The Louis d'or is a gold coin of Malta. The double, single, and half Louis d'ors are coined by the grand master Rohan, at 20, 10, and 5 scudi, copper or current money. The double Louis weighs 10 dwt. 16 gr., contains of pure gold 215.3 gr., and is valued at 1*l.* 18*s.* 1*d.* sterling. The Louis weighs 5 dwt. 8 gr., contains of pure gold 108 gr., and is valued at 19*s.* 1*d.* sterling. The demi-louis weighs 2 dwt. 16 gr., contains of pure gold 54.5 gr., and is valued at 9*s.* 7*d.* sterling. The fineness of the gold coins of Malta undergoes great variation. Kelly's Universal Cambist.

LOUIS, Knights of St., is the name of a royal and military order, instituted by Louis XIV., in addition to that of "Christian charity," which had been founded by Henry III. king of France, in 1693, in favour of the maimed officers and soldiers of his army, who had signalized themselves in the service. This order consisted of eight great crosses, and twenty-four commanders, besides the king, who was grand master, the dauphin always invested with it, and the treasurer, recorder, and usher. The badge of the order was "a cross of eight points enamelled white, edged with gold:

in the angles four fleur-de-lis; and in the middle a circle, within which on one side the image of St. Louis in armour, with the royal mantle over it, holding in his right hand a crown of laurel, and in his left hand a crown of thorns, and the three passion-nails, all proper; with this inscription, LUDOVICUS MAGNUS INSTITUIT 1693: on the reverse, "a sword erect, the point through a chaplet of laurel," bound with a white ribbon enamelled, with this motto, BELLECE VIRTUTIS PRÆMIUM. The great crosses had the cross pendent to a broad bright red ribbon, which they wore passing fearfully over the left shoulder and under the right arm: they also wore the like cross embroidered with gold on the outside of their upper garment. The commanders wore the cross pendent to a broad ribbon, in the same manner as worn by the great crosses; but they have it not embroidered on their clothes. The knights wore a small gold cross pendent at a red ribbon, fastened at a button-hole of their coats.

At the time of their institution, the king charged his revenue with a fund of three hundred thousand livres, for the pensions of the commanders and knights.

LOUIS, St., in *Geography*, an island on the west coast of Africa, at the mouth of the river Senegal; flat, sandy, and barren. Its name is derived from a fort built by the French. Both were ceded to the English by the treaty of Versailles, in 1763. During the American war it was taken by the French, and kept by them after the peace of 1783. N. lat. 16°. W. long. 16° 8'.—Also, a sea-port town on the south coast of the island of Hispaniola. It is situated at the head of a bay of its name. N. lat. 18° 16'. W. long. 74° 19'.—Also, a sea-port town of Hispaniola, on the north coast: ruined in 1797 by a hurricane; 5 miles S.E. of Cape François.—Also, a town of South America, in the province of Guiana. N. lat. 3° 55'. W. long. 52° 30'.—Also, the capital town of Guadaloupe, Grand Terre, with a fortress; 3 leagues S.E. of the Salt river.—Also, a town on the west side of the river Mississippi, 25 miles below the mouth of the Missouri. It is situated on a pleasant and healthy eminence, and contained, in 1799, 130 large commodious houses, built of stone, and 925 inhabitants, of whom 268 are slaves. In this year the productions of the settlement were 4300 bushels of wheat, 12,300 bushels of corn, and 1650 pounds of tobacco. The inhabitants possessed 1140 horned cattle, and 215 horses.—Also, a small, compact, beautiful bay in West Florida, with about seven feet water: the land near it is of a light soil, and good for pasture. Formerly here were several settlers; but in the year 1767 the Choctaw Indians killed their cattle, and obliged them to remove.—Also, a lake of Canada, commencing, or rather terminating at La Chine, a village which stands at the lower end of it. The lake is about 12 miles in length, and four in breadth. At its uppermost extremity it receives a large branch of the Utawas river, and also the south-west branch of the river St. Lawrence, which by some geographers is called the river Cadaraqui, and by others the river Iroquois; but in the country, generally speaking, the whole of that river, running from lake Ontario to the gulf of St. Lawrence, goes simply under the name of St. Lawrence. At the upper end of lake St. Louis, the water is very shallow, owing to the banks of mud and sand washed up by the two rivers; and these banks are entirely covered with reeds, so that when a vessel sails over them, the appears at a little distance to be absolutely sailing over dry land. This part of the lake is infested with clouds of insects, similar to those which have been commonly observed on various parts of the river St. Lawrence. Their size is about that of a gnat; their colour is white; and their form so delicate,

that the slightest touch destroyed them, and reduced them to powder. Their wings are broad in proportion to their size, and fly heavily; so that it is only when the air is remarkably calm, that they can venture to make their appearance. N. lat. 45° 25'. W. long. 73° 20'. Weld's Travels through Canada, vol. ii.—Also, a group of small islands in the river St. Lawrence. N. lat. 45° 23'. W. long. 73° 30'.—Also, a river of America, which runs into lake Superior. N. lat. 46° 44'. W. long. 91° 52'.

Louis de Maranham, St., a town on the north coast of Brazil, and on the Atlantic ocean, situated on the east side of Mearim river; about half way between point Mocoripe and the mouth of the river Para.

LOUISA, or **DEGERBY**, a sea-port town of Sweden, in the province of Nyland, on the north coast of the gulf of Finland, built in 1745 as a frontier town towards Russia, and at first called Degerby, but afterwards Louisa, in 1752, by king Adolphus Frederic. It is an open town, defended towards the sea by a small fortress. The houses are all of wood, and of two stories, painted with a red colour, and appearing much neater than the common towns in Russia. N. lat. 60° 27'. E. long. 26° 16'.

LOUISA, a county of Virginia, adjoining Orange, Albemarle, Fluvanna, Spottsylvania, and Goochland counties. It is about 35 miles long, and 20 broad, and contains 5000 free inhabitants, and 5992 slaves. Many parts of this county are covered with pine.—Also, a river of Virginia, the head-water of Cole river, a south-west branch of the Great Kanlaway.—Also, a river of Africa, which runs into the Atlantic, S. lat. 5° 10'.

LOUISA Chitto, or **Loesja Chitto**, a river of America, which rises on the borders of South Carolina, and runs a south-westerly course, through the Georgia Western lands, and joins the Mississippi just below the Walnut hills, and 10 miles from Stony river. It is 30 yards wide at its mouth, and said to be navigable for canoes 30 or 40 leagues.

LOUISBOURG, the capital of Sydney, or Cape Breton, island, in North America; situated on a point of land, on the south-east side of the island. Its streets are regular and broad, consisting chiefly of stone houses, with a large parade, at a little distance from the citadel, the inside of which is a fine square, nearly 200 feet on each side. On its north side, while the French had possession of it, stood the governor's house and the church; the other sides were occupied by barracks, bomb-proof, in which the French secured their women and children during the siege. The town is nearly half a mile long, and two in circuit. Its harbour is one of the finest in that country, being almost four leagues in circuit, with six or seven fathoms of water in every part of it. The anchorage is good, and ships may run aground without danger. Its entrance is not above 300 toises in breadth, formed by two small islands, and is known, 12 leagues out at sea, by cape Lorembec, situated near the north-east side of it. The interior of the harbour is more than half a mile broad from N.W. to S.E. in the narrowest part, and six miles long from N.E. to S.W. In the north-east part is a fine careening wharf, secure from all winds. On the opposite side are the fishing stages, and room for 2000 boats to cure their fish. The cod-fishery may be continued from April to the close of November. In winter the harbor is entirely frozen, so that it may be walked over; and it continues in this state from the end of November till May or June. The principal trade of Louisbourg is the cod-fishery, from which the inhabitants derive great profits; fish being plentiful, and deemed better than any about Newfoundland. This place was taken from the French in 1745.

and restored to France by the treaty of Aix-la-Chapelle in 1748. It was again captured by the English in 1758, and its fortifications have been since demolished. N. lat. 45° 55'. W. long. 59° 50'.

LOUISBOURGH, in Pennsylvania. See HARRISBURGH.

LOUISBURG, a post-town of America, in Franklin county, North Carolina; 265 miles from Washington.

LOUISIADE, the southern coast of a considerable island belonging to New Guinea, so called by M. Bougainville in 1768.

LOUISIANA, a country of North America, first discovered by Ferdinand de Soto in 1541, and afterwards visited by colonel Wood in 1654, and by captain Bolt in 1670. But the first person who attempted to settle in this country was M. de la Salle, who, in 1682, traversed the Mississippi; and in the following year he repaired to France, and, in consequence of the representations which he made of his discoveries, obtained a grant of four small vessels and 170 men, with which armament he set sail for the mouth of the Mississippi. In 1683 this small colony, under the direction of their leader, landed in the bay of St. Bernard's, about 300 miles west of the place of their destination. After struggling with many hardships, both in their landing and in their endeavours to settle, some of this colony murdered La Salle, and all the rest perished, except seven persons, who penetrated through the country to Canada. In 1699, M. Iberville of Canada, a brave naval officer, having obtained the patronage of the French court, sailed from Rochfort with two ships and a number of men, and laid the foundation of the first French colony on the Mississippi. This colony was diminished, by some unfavourable circumstances in 1712, to 28 families. At this time Crozat, a merchant of great opulence and an adventuring spirit, obtained the exclusive trade of Louisiana; but his plans, which were extensive and patriotic, proving ineffectual, he resigned his charter, in 1717, to a company formed by the famous projector John Law. From this period the country became an object of interest to speculative adventurers, so that in 1718 and 1719 a numerous colony of labourers, collected from France, Germany, and Switzerland, was conveyed to Louisiana, and settled in a district called "Biloxi" on the island of Orleans, a barren and unhealthy situation, where many hundreds died through want and vexation. This event ruined the reputation of the country; and the colony having languished till the year 1731, the company at length, for the sum of 1,450,000 livres, purchased the favour of surrendering their concerns into the hands of the government. The French continued in quiet possession of Louisiana, frequent contests with the Indians excepted, till the year 1762. Among these tribes of hostile Indians we may reckon the Natchez, who appear in the year 1731 to have been almost wholly extirpated. In 1736 and 1740 the colonists were engaged in bloody wars with the Chickasaw Indians; but these, in process of time, terminated in permanent peace. From this time the prospects of the colonists were brightening, as their peltary trade with the Indians and their commerce with the West Indies were increasing. Several hundred Canadians and recruits of inhabitants from other countries settled on the banks of the Mississippi, and imparted additional strength and prosperity to the original colony.

Such was the state of the country, when in the year 1764 the inhabitants received information that in November 1762, Louisiana, comprehending New Orleans and the whole territory W. of the Mississippi, had been ceded to Spain by a secret treaty. This measure incensed the colonists, and was vigorously opposed, so that complete possession of the coun-

try was not obtained by Spain till the 17th of August 1769, after which event several victims were sacrificed, to atone for the delay of submission, and others were conveyed away to languish out their lives in the dungeons of the Havana. By the treaty of peace in 1763, which ceded Canada to Great Britain, the boundaries of the British provinces were extended southward to the gulf of Mexico, and westward to the Mississippi, and Louisiana was limited N. by Canada, and E. by the Mississippi, excepting that it included the island of New Orleans and its E. bank. The state of things remained till the American revolutionary war, during which Spain took from Great Britain the two Floridas: the United States, according to their present limits, became an independent government, and left to Great Britain, of all her American provinces, those only which lie N. and E. of the United States. All these changes were sanctioned and confirmed by the treaty of 1783. Thus things continued till the treaty of St. Idelfonso, October 1, 1800, by which Spain engaged to cede to the French republic, on certain conditions, the colony or province of Louisiana, with the same extent which it actually had when France possessed it. This treaty was confirmed and enforced by the treaty of Madrid, March 21, 1801. From France it passed to the United States by the treaty of the 30th of April 1803. In consideration of this cession, the government of the United States engaged to pay to the French government, under certain stipulations, the sum of 60,000,000 francs, independent of the sum which should be fixed by another convention for the payment of the debts due by France to the citizens of the United States. The boundaries of Louisiana, as formerly possessed by France and Spain, and now held by the United States, are stated as follows; viz. S. on the gulf of Mexico, from the bay of St. Bernard, S.W. of the Mississippi to the mouth of the Rio Perdido, or Lost river, so called by the Spaniards, because it loses itself under ground, and afterwards appears again, and discharges itself into the sea a little to the E. of Mobile, on which the first French planters settled; up the Perdido to its source, and thence (if it rise not N. of the 31st degree of lat.) in a straight line N. to that parallel; thence along the southern boundary of the United States, W. to the Mississippi; then up this river to its source, as established by the treaty of 1783. Beyond this point, the limits, (which have never been accurately ascertained,) may be considered as including the whole country between the White Bear Lake, or other head of the Mississippi, and the source of the Missouri; and between this last and the head springs of the Arkansas, Red river, and other copious streams, which fall into the Mississippi; or, in other words, Louisiana may be considered as bounded N. and N.W. by the high lands, which divide the waters that fall into the St. Lawrence and Hudson's Bay from those which fall into the Mississippi; W. by that high chain of mountains, known by the name of the "Shining Mountains," which may be called the "Spine" or "Andes" of that part of North America, and which turn the waters on the W. of them to the Pacific, and those on the E. to the Atlantic ocean. In a word, it embraces the whole slope, or inclined plain, fronting the S.E. and E. down which the various streams flow into the bed of the Mississippi. On the S.W. it is bounded by New Mexico, between which and Louisiana the divisional line has never been settled. Some pretend that this boundary is a right line from the head of Red river to that of Rio Bravo, and thence down its channel to the gulf of Mexico. Others make the Rio Colorado, and others, with greater probability, make the Rio Mexicano, the S.W. boundary of Louisiana.

Louisiana may naturally be divided into the three following districts:

Districts: viz. Eastern, Lower, and Upper Louisiana. The *Eastern* division comprehends all that part of this territory which lies E. of the Mississippi, bounded S. by the gulf of Mexico, E. by Perdido river, N. by the Mississippi territory, and W. by the Mississippi river. This division includes the island of New Orleans, and is watered by the Mobile, Pascagoula, Pearl, Boguchito, Tanisipaho, and Amit rivers, with Thompson's creek, and Bayou Sara. The whole coast, embracing the old Biloxi district, consists of a fine white sand, injurious to the eyes, and so dry as not to be fit to produce any thing but pine, cedar, and some ever-green oaks. The Mobile river has few fish, and its banks and vicinity are not very fertile. Between Pascagoula and Mississippi rivers, the country is intermixed with extensive hills, fine meadows, numerous thickets, and in some places woods thickset with cane, particularly on the banks of rivers and brooks, and proper for agriculture. Its coast, though flat, dry, and sandy, abounds with delicious shell and other fish, and affords security against the invasion of an enemy.

Lower Louisiana comprehends that part of this territory bounded E. by the Mississippi river, S. by the gulf of Mexico, S. W. and W. by New Mexico, N. by a line drawn from the Mississippi W., dividing the country in which stone is found from that in which there is none. This part of Louisiana is watered by Red river, and many others which fall into the gulf of Mexico. On both sides of the mouths of the Mississippi are quagmires, affording a safe retreat for water-fowl, guats, and mosquitoes, and extending for more than twenty miles. The whole coast from the Mississippi, W. as far as St. Bernard's bay and beyond it, resembles that already described of the eastern division: and the soil is barren. In ascending the Mississippi, beyond the marshes, are some narrow strips of firm land, partly bare of trees and partly thickly covered with them; which are fit for cultivation. This part seems to have been either recovered from the sea, or formed by various materials that have descended to it; and it is not unreasonable to imagine, that in process of time the river and sea may form another tract of country like Lower Louisiana. The principal river is the Mississippi; which see. The Red river has its source not far from that of Rio Bravo, or Riodel Norte, on which the city of Santa Fé is built, and in the mountain which has the springs of the Missouri. On each side of this river are some scattered settlements, for about fifty miles to Bayan Rapide, in which are about 100 families. The land here is not inferior to any in the world with regard to fertility; and for a space of about 40 miles from hence to the commencement of the Appalusa prairies, the country is equally rich and well-timbered. It is perfectly level, and the soil 20 feet deep, and like a bed of manure. Higher up, the banks and low lands are of similar quality with the lands on Bayan Rapide, the texture of the soil being somewhat looser; but there are few settlements, till you come to the river Cane settlements, 60 or 70 miles higher up Red river. Hence to the village or port of Natchitoches, about 50 miles, and 25 miles above it, the banks of one branch of Red river are settled like those of the Mississippi, and the country abounds with beautiful fields and plantations, and luxuriant crops of corn, cotton, and tobacco. (See NATCHITOCHEES.) The low grounds of Red river, generally five or six miles wide, have an uncommonly rich soil, which is overflowed annually in the month of April. The crops of corn and tobacco are plentiful, and never fail. The soil is particularly favourable for tobacco; an acre yields from 80 to 100 bushels of corn; and it is no less productive of cotton. Two men, with ten or twelve old pots and kettles, supply the settlement on Red river with salt, the springs of which are almost inexhaustible.

Here is likewise plenty of iron and copper ore, pit-coal, shell and stone lime. The different branches of the river the lakes, creeks, and bayans furnish abundance of very fine fish, cockles, soft-shelled turtle and shrimps, and in winter great varieties of wild fowl. The country is far from being sickly. The moschetto is rarely seen. The high lands are covered with oak, hickory, ash, gum, sassafras, dogwood, grape-vines, &c. intermixed with short-leaved pine, and interperfed with prairies, creeks, lakes, and fountains. Its hills and vallies are gently varied, and the soil is generally a stony clay. The country on Red river is most valuable, beginning about 50 or 60 miles above the upper settlements, and extending 4 or 500 miles. The low lands, about 40 miles on each side, are remarkably rich, interperfed with prairies, and beautiful streams and fountains; also quarries of free-stone, lime, flint, slate, grit, and almost every kind of stone. About 30 miles from the mouth of Red river, Black river falls into it on the N. side, which is a clear and navigable stream for 5 or 600 miles: about 100 miles upwards, it branches in three different directions: the eastern branch, called the Tenaw, is navigable for many miles, and affords rich land: the middle or main branch, called Watheta, is navigable 500 miles, and affords excellent lands, salt-springs, lead-ore, and plenty of very good mill and grind-stones: the western branch, called Catahola, runs through a beautiful, rich, prairie country, in which is a large lake, called Catahola lake. On this lake are salt-springs, and it abounds with fish and fowl. On the river called Ozark are many valuable tracts of land, which is likewise the case with respect to White river and St. Francois.

Upper Louisiana comprehends all the remainder of this territory, and is the largest and most valuable part. It is bound S. by Lower Louisiana, on the E. by Mississippi, N. and W. by the highlands and mountains which divide the waters of St. Lawrence, Hudson's bay, and the Pacific ocean, from those of the Mississippi. It is watered by the Red river, the Arkansas, St. Francis, and the Missouri, with a vast number of smaller streams which fall into these or the Mississippi. From the lower settlement at Sans la Grace, to the upper settlement on the Missouri, about the distance of 250 miles, is a country equal to any part of the western territory, containing a population of 50 or 60,000, and furnishing lead and iron mines. The soil is at the bottom a solid red clay, and this is covered by a light earth almost black and very fertile. The grass grows here to a great height, and towards the end of September is set on fire; and in eight or ten days after, the young grass shoots up half a foot high. In advancing northwards towards the Arkansas and St. Francis, the country becomes more beautiful and fertile, abounding in various kinds of game, as beavers, &c. and herds of deer, elks, and buffaloes, from 6 to 100 in a drove. Here have been also found specimens of rock crystal, plaster of Paris, lead, and iron ore, lime-stone, and pit-coal. It has all the trees known in Europe, besides others that are there unknown. The cedars are remarkably fine; the cotton trees grow to such a size, that the Indians make canoes out of their trunks: hemp grows naturally; tar is made from the pines on the sea coast; and the country affords every material for ship-building. Beans grow to a large size without culture; peach trees are heavily laden with fruit; and the forests are full of mulberry and plum trees. Pomgranate and chefnut trees are covered with vines, whose grapes are very large and sweet. They have three or four crops of Indian corn in the year: as they have no other winter besides some rains. Here are also mines of pit-coal, lead and copper, quarries of free-stone, and of black, white, and jasper-like marble, of which they make their calumets.

LOUISIANA.

calumets. One species of timber, which is common from the mouth of the Ohio down the Mississippi swamp, is cotton wood, resembling the Lombardy poplar in the quickness of its growth, and the softness of the timber. Here are also the papaw and black ash, button wood or sycamore, hickory, and cypress; wild cherry, fassafras, beech, chestnut, and Bernudian mulberry trees. From the Walnut hills to Point Coupee, and easterly 15 or 20 miles, the whole country in its natural state is one continued cane-brake. The cane in general is 36 feet high, often 42; intermingled with a smaller species, which continue thence on all the creeks to the gulf of Mexico.

Above the Nachitoches are the habitations of the Cadodquiabos Indians; near one of their villages is a rich silver mine; another lies further north. Lead ore is also found in different places, and also iron ore, pit-coal, marble, slate, and plaster of Paris.

As to the climate of this country, during the winter the weather is very changeable, generally throughout Lower, and the southern part of Upper Louisiana. In summer it is regularly hot. In the latitude of the Natchez, Fahrenheit's thermometer ranges from 17° to 96° . The average degree of heat is stated to be 14° greater than in Pennsylvania. The climate of Louisiana varies in proportion as it extends northward. Its southern parts are not subject to the same degree of heat as the same latitudes in Africa, nor its northern parts to the same degree of cold as the corresponding latitudes in Europe; owing to the thick woods which cover the country, and to the great number of rivers which intersect it. The prevailing diseases on the lower part of the Ohio, on the Mississippi, and through the Floridas, are bilious fevers. In some seasons they are mild, and are little more than common intermittents; in others they are very malignant, and approach the genuine yellow fever of the West Indies.

The total population of all the parts or districts of Louisiana, including whites, free people of colour, and slaves, is 42,375, of whom 12,920 are slaves. But it is apprehended that this number is too small. The Spanish government is fully persuaded that the population at present considerably exceeds 50,000 persons. The inhabitants of this country are chiefly the descendants of the French and Canadians. In New Orleans there is a considerable number of English and Americans. The two German coasts are peopled by the descendants of settlers from Germany, and by French mixed with them. The three succeeding settlements up to Baton Rouge contain mostly Acadians, banished from Nova Scotia by the English, and their descendants. The government of Baton Rouge, especially on the E. side, which includes the whole country between the Iberville and the American line, is composed partly of Acadians, a few French, and a great majority of Americans. On the W. side they are mostly Acadians; at Point Coupee and Faussee river they are French and Acadians; of the population of the Atacapas and Opelousas, a considerable part is Americans; Nachitoches, on the Red river, contains but a few Americans, and the rest of the inhabitants are French; but the former are more numerous in the other settlements on that river, *viz.* Avoyelles, Rapide, and Ouacheta. At Arkansas they are mostly French; and at New Madrid, Americans. At least two-fifths, if not a greater proportion of all the settlers on the Spanish side of the Mississippi, in the Illinois country, are likewise supposed to be Americans. Below New Orleans the population is altogether French, and the descendants of Frenchmen. The natives of the southern part of the Mississippi are sprightly; they have a turn for

mechanics, and the fine arts; but their system of education is so wretched, that little real science is obtained. Many of the planters are opulent, industrious, and hospitable. There is a militia in Louisiana, amounting, as it is said, to about 10,340. The Indian nations within the limits of Louisiana, are as follow, according to the statement of the late president of the United States, Mr. Jefferson: on the E. bank of the Mississippi, about 25 leagues above Orleans, are the remains of the Houmas or Red men, amounting to about 60 persons; on the W. side of the same river are the remains of the Tunicas, settled near and above Point Coupee, consisting of 50 or 60 persons. In the Atacapas, on the lower part of the Bayou Teche, about 11 or 12 leagues from the sea, are two villages of Chitimachas, consisting of about 100 persons; the Atacapas, properly so called, dispersed throughout the district, are about 100; and there are about 50 wanderers of the tribes of Biloxis and Choctaws on Bayou Crocodile, which empties into the Teche. In the Opelousas, N.W. of Atacapas, are two villages of Alibamas in the centre of the district, consisting of 100 persons; and the Conchates dispersed through the country as far as the Sabinas and its neighbourhood, are about 350. On the river Rouge, at Avoyelles, 19 leagues from the Mississippi, is a village of the Biloni nation, and another on the lake of the Avoyelles, the whole including about 60 persons. At the Rapide, 26 leagues from the Mississippi, is a village of Choctaws, consisting of 100 persons, and another of Biloxes, about two leagues from it, of about 100 more; and at about eight or nine leagues higher up the Red river is a village including about 50 persons. All these are occasionally employed by the settlers as boatmen. About eighty leagues above Nachitoches on the Red river is the nation of the Cadodquiabos, or Cados, who can raise from three to four hundred warriors, the friends of the whites, and esteemed the bravest and most generous of all the nations in this vast country; they are rapidly declining by their intemperance, and by the attacks of the Osages and Choctaws. There are 500 families of the Choctaws, dispersed on the W. side of the Mississippi, on the Ouacheta and Red rivers, as far W. as Nachitoches. On the river Arkansas is a nation of the same name, consisting of about 260 warriors, brave, yet peaceable and well-disposed, attached to the French, and disposed to engage in their wars with the Chickasaws. They live in three villages at 18 leagues from the Mississippi on the Arkansas river, and the others are at three and six leagues from the first. A scarcity of game on the E. side of the Mississippi has induced a number of Cherokees, Choctaws, Chickasaws, &c. to frequent the neighbourhood of Arkansas, where game is still abundant, where they have contracted marriages with the Arkansas, and incorporated themselves with that nation. On the river St. Francis, in the vicinity of New Madrid, &c. are settled a number of vagabonds from the Delawares, Shawnees, Miamis, Chickasaws, Cherokees, Piorias, supposed to consist in all of 500 families. They are piratical in their disposition, attached to liquor, unsettled and vagrant in their habits, some of them speak English, all understand it, and some of them can even read and write it. At St. Genevieve, about 30 leagues, Kaskaskias and Illinois, are settled among the whites. There are the remains of a nation, which 50 years ago could bring into the field 1200 warriors.

On the Missouri and its waters, are many and numerous nations, the best known of which are; the Osages, situated on the river of the same name on the right bank of the Missouri, at about 80 leagues from its confluence with it; they consist of 1000 warriors, who live in two settlements at no great distance from each other. They are of a gigantic stature

are and well proportioned, are enemies of the whites and of all other Indian nations, and commit depredations from the Illinois to the Arkansas. The trade of this nation is said to be under an exclusive grant. They are a cruel and ferocious race, and are hated and feared by all the other Indians. The confluence of the Osage river with the Missouri is about eight leagues from the Mississippi. Sixty leagues higher up the Missouri, and on the same bank, is the river Kansas, and on it the nation of the same name, but at about 70 or 80 leagues from its mouth. It consists of about 250 warriors, who are as fierce and cruel as the Osages, and often molest and ill treat those who go to trade among them. Sixty leagues above the river Kansas, and at about 200 from the mouth of the Missouri, still on the right bank, is the Riviere Platte, or Shallow river, remarkable for its quicksands and bad navigation; and near its confluence with the Missouri dwells the nation of Osotolactos, commonly called Otos, consisting of about 200 warriors, among whom are 25 or 30 of the nation of Missouri, who took refuge among them about 25 years since. Forty leagues up the river Platte you come to the nation of Panis, composed of about 700 warriors in four neighbouring villages; they hunt but little, and are ill provided with fire arms; they often make war on the Spaniards in the neighbourhood of Sante Fé, from which they are not far distant. At 300 leagues from the Mississippi, and 100 from the river Platte on the same banks, are situated the villages of the Mahas. They consisted, in 1799, of 500 warriors, but are said to have been almost cut off last year by the small pox. At 50 leagues above the Mahas, and on the left bank of the Missouri, dwell the Poncas, to the number of 250 warriors, possessing in common with the Mahas, their language, ferocity, and vices. Their trade has never been of much value, and those engaged in it are exposed to pillage and ill treatment. At the distance of 450 leagues from the Mississippi, and on the right bank of the Missouri, dwell the Aricaras, to the number of 700 warriors, and 60 leagues above them, the Mandane nation, consisting of about 700 warriors likewise. These two last nations are well disposed to the whites, but have been the victims of the Sioux, or Mandowessies, who being themselves well provided with fire-arms, have taken advantage of the defenceless situation of the others, and have on all occasions murdered them without mercy. No discoveries on the Missouri, beyond the Mandane nation, have been accurately detailed, though the traders have been informed, that many navigable rivers discharge their waters into it, above it, and that there are many numerous nations settled on them. The Sioux, or Mandowessies, who frequent the country between the N. bank of the Missouri and Mississippi, are a great impediment to trade and navigation. They endeavour to prevent all communication with the nations higher up the Missouri, to deprive them of ammunition and arms, and thus keep them subservient to themselves. In the winter they are chiefly on the banks of the Missouri, and massacre all who fall into their hands. There are a number of nations at a distance from the banks of the Missouri, to the N. and S. of whom we have but little information has been received. Returning to the Mississippi, and ascending it from the Missouri, about 75 leagues above the mouth of the latter, the river Mingo, or Riviere de Moine, enters the Mississippi on the west side, and on it are situated the Ayons, a nation originally from the Missouri, speaking the language of the Otchattas; it consisted of 200 warriors before the small-pox lately raged among them. The Sacs and Renards dwell on the Mississippi, about 300 leagues above St. Louis, and frequently trade with it; they live together, and consisted of 500 warriors; their chief trade is with Michilimackinac, and

they have always been peaceable and friendly. The other nations on the Mississippi, higher up, are but little known to us. The Sac and Fox nations of India have ceded to the United States a valuable country, with a front of 600 miles on the Mississippi. It contains 80,000 square miles, and is equal to 51,200,000 acres. The treaty ceding this territory, was signed at St. Louis, the 3d of Nov. The nation of the Missouri, though cruel, treacherous, and insolent, may doubtless be kept in order by the United States, if proper regulations are adopted with respect to them. It is said, that no treaties have been entered into by Spain with the Indian nations westward of the Mississippi, and that its treaties with the Creeks, Choctaws, &c. are in effect superfluous by our treaty with that power of the 27th October 1795.

The productions of Louisiana are sugar, cotton, indigo, rice, furs, and peltry, lumber, tar, pitch, lead, flour, horses, and cattle. The soil is fertile, the climate salubrious, and the means of communication between most parts of the province certain, and by water. The exports of Louisiana amount in value to 2,158,000 dollars; and the imports, in merchandize, plantation utensils, slaves, &c. amount to 2½ millions, the difference being made up by the money introduced by the government, to pay the expences of governing and protecting the colony. The imports to the United States from Louisiana and the Floridas amounted in 1802 to 1,006,214 dollars, and the exports to Louisiana and the Floridas in the same year to 1,224,710 dollars. In Louisiana there are few domestic manufactures. The Acadians manufacture a little cotton into quilts and cottonades, and in the remoter parts of the province, the poorer planters spin and weave some negro cloths of cotton and wool mixed. In the city, besides the trades which are absolutely necessary, there is a considerable manufacture of cordage, and four small ones of shot and hair powder; and within a few leagues of the town are twelve distilleries for making tafia, which are said to distil annually a considerable quantity, and one sugar refinery, which is said to make about 200,000 lbs. of loaf sugar. There are no colleges, and but one public school, which is at New Orleans. There are a few private schools for children. Not more than half of the inhabitants are able to read and write. In general the learning of the inhabitants does not extend beyond those two arts; though they seem to be endowed with a good natural genius, and a good and an uncommon facility of learning whatever they undertake. The clergy consists of a bishop, who does not reside in the province, whose salary of 4000 dollars is charged on the revenue of certain bishoprics in Mexico and Cuba; two canons, and 25 curates, receive each from 360 to 480 dollars a-year. At Orleans there is a convent of Ursulines, to which is attached about 1000 acres of land. Raynal, Jefferson, Morse.

LOUISTOWN, a town of America, in Talbot county, Maryland, on the W. side of Tuckahoe creek; four miles N. of King's-town.

LOUISVILLE, a port of entry, post-town of Kentucky, and capital of Jefferson county, pleasantly situated on the left side of the Ohio, on an elevated plain above the Rapid, nearly opposite to Fort Memy. It commands a delightful prospect, but the stagnated waters behind it render it unhealthy. It consists of three principal streets, and contains about 100 houses, 350 inhabitants, a court-house, and gaol; 40 miles W. of Frankfort. — Also, the present seat of government in Georgia, situated in Jefferson county, in the lower district of the state, on the N.E. bank of the Great Ogeechee river, 70 miles from its mouth. It contains a state-house, a tobacco warehouse, and upwards of forty dwelling houses. In the vicinity is situated a liberally endow-

dowed college; 52 miles S.E. of Augusta. N. lat. $32^{\circ} 55'$. W. long. $82^{\circ} 42'$.

LOULAY, a town of France, in the department of the Lower Charente, and chief place of a canton, in the district of St. d'Angely, and six miles N. of it. The place contains 366, and the canton 7161 inhabitants, on a territory of $167\frac{1}{2}$ kilometres, in 19 communes.

LOULE, a town of Portugal, in the province of Algarva, on a river of the same name, near the sea; surrounded with antique walls, and containing a castle, hospital, three convents, and about 4400 inhabitants; nine miles N. of Faro. N. lat. $37^{\circ} 8'$. W. long. $7^{\circ} 54'$.

LOULIE, FRANÇOIS, in *Biography*, a French musician, who published in 1696 an ingenious and useful book, intitled "Elements of Music," with a description of a chronometer to measure time by a pendulum. See CHRONOMETER, and its description, from this book, in Malcolm, p. 407, and in 1698, another book was printed by Etienne Roger, at Amsterdam, called "A New System of Music," by the same author. In this work, besides the usual instructions in elementary books, he explains the nature of transposition, and proposes a method of reducing a piece of music into any key different from that in which it was originally composed, by means of imaginary clefs. See TRANSPOSITION, and Dr. Pepusch's "Treatise on Harmony."

LOUNG, in *Geography*, a town of Hindoostan, in the circle of Schaurumpour; 28 miles S. of Merat.

LOU-NGHAN, a city of China, of the first rank, in the province of Chen-li. N. lat. $36^{\circ} 42'$. E. long. $116^{\circ} 42'$.

LOUP, a river of France, which runs into the Mediterranean. N. lat. $43^{\circ} 38'$. E. long. $7^{\circ} 12'$.—Also, a river of Canada, which runs into the lake St. Pierre. N. lat. $46^{\circ} 13'$. E. long. $72^{\circ} 47'$.

LOUP, St., a town of France, in the department of the Upper Saone, and chief place of a canton, in the district of Lure; six miles N.W. of Luxeuil. The place contains 1891, and the canton 13,366 inhabitants, on a territory of 195 kilometres, in 14 communes.—Also, a town of France, in the department of the Two Sevres, and chief place of a canton, in the district of Parthenay, near the river Thoue; nine miles N.N.E. of Parthenay. The place contains 1649, and the canton 5968 inhabitants, on a territory of $197\frac{1}{2}$ kilometres, in nine communes.

LOUP de Salle, St., a town of France, in the department of the Sone and Loire, near the river Heune; 11 miles N. of Chalon sur Saone.

LOUPPE, LA, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the district of Nogent-le-Rotrou; 18 miles W. of Chartres. The place contains 1178, and the canton 10,315 inhabitants, on a territory of 245 kilometres, in 21 communes.

LOUPTIERE, JOHN CHARLES DE RELONGUE, in *Biography*, was born in the diocese of Sens in 1727; he became a member of the academy of the Arcadi at Rome, and died in the year 1784. He is known by a collection of poems in two volumes 12mo., written with much spirit and elegance; and by six parts of a Journal for ladies printed in 1761.

LOURDE, in *Geography*, a town of France, in the department of the Higher Pyrenées, and chief place of a canton, in the district of Argelès; six miles N. of Argelès. The place contains 2741, and the canton 10,418 inhabitants, on a territory of 180 kilometres, in 27 communes. N. lat. $43^{\circ} 6'$. E. long. $0^{\circ} 1'$.

LOURE, in *French Music*, a kind of dance, of which the tune is rather slow, and generally in the measure of 2, or six crotchets in a bar. *Loire* is likewise the name of an instrument resembling a bagpipe, to the music of which the tune is danced.

LOURER is a verb, which implies sustaining and cherishing the times of a movement, in opposition to *détacher*, separated.

LOUREZA, in *Geography*, a town of Spain, in Galicia; eight miles W. of Tuy.

LOURICAL, a town of Portugal, in the province of Estremadura; six miles N. of Leyria.

LOURINHA, a town of Portugal, in the province of Entre Duero e Minho; 8 miles S.S.E. of Peniche.

LOURISTAN. See LARISTAN.

LOUROUX-BECONNOIS, LE. See LOROUX. The place contains 2018, and the canton 6855 inhabitants, on a territory of $227\frac{1}{2}$ kilometres, in seven communes.

LOUS, *Æt.*, in *Chronology*, the Macedonian name for the Athenian month Hecatombæon, which was the first of their year, and answered to the latter part of our June and the beginning of July.

LOUSE, in *Zoology*. See PEDICULUS. This creature has so transparent a shell, or skin, that we are able to discover more of what passes within its body, than in most other living creatures. It has naturally three divisions, the head, the breast, and the tail part. In the head appear two fine black eyes, with a horn that has five joints, and is surrounded with hair standing before each eye; and from the end of the nose, or snout, there is a pointed projecting part, which serves as a sheath or case to a piercer, or sucker, which the creature thrusts into the skin, to draw out the blood and humours which are its destined food; for it has no mouth that opens in the common way. This piercer or sucker is judged to be seven hundred times smaller than a hair, and is contained in another case within the first, and can be thrust out or drawn in at pleasure. (Baker's Microscope, p. 177.) The breast is very beautifully marked in the middle, the skin is transparent, and full of little pits; and from the under part of it proceed six legs, each having five joints, and their skin all the way resembling shagreen, except at the ends, where it is smoother. Each leg is terminated by two claws, which are hooked, and are of an unequal length and size: these it uses as we would a thumb and a middle finger, and there are hairs between these claws as well as all over the legs. Læwenhoeck's Arcan. Nat. tom. ii. p. 74.

On the back of the tail part there may be discovered some ring-like divisions, abundance of hairs, and a sort of marks which look like the strokes of a rod on a child that has been whipped; the skin of the belly seems like shagreen, and towards the lower end is very clear, and full of pits: at the extremity of the tail there are two semicircular parts, covered all over with hairs, which serve to conceal the anus.

When the louse moves its legs, the motion of the muscles, which all unite in an oblong dark spot in the middle of the breast, may be distinguished perfectly, and so may the motion of the muscles of the head when it moves its horns. We may likewise see the various ramifications of the veins and arteries, which are white, with the pulse regularly beating in the arteries. But the most surprising of all the sights is the peristaltic motion of the guts, which is continued from the stomach down to the anus. Philos. Trans. N 102.

It one of these creatures, when hungry, be placed on

the back of the hand, it will thrust its sucker into the skin, and the blood it sucks may be seen passing in a fine stream to the fore-part of the head; where falling into a roundish cavity, it passes again in a fine stream to another circular receptacle in the middle of the head; from thence it runs through a smaller vessel to the breast, and then to a gut which reaches to the hinder part of the body, where in a curve it turns again a little upward. In the breast and the gut the blood is moved without intermission with a great force, especially in the gut; and that with so strong a propulsion downward, and such a contraction of the gut, as is very surprisng. Power's Mic. Obs. 9.

In the upper part of the crooked ascending gut before mentioned, the propelled blood stands still, and seems to undergo a separation; some of it becoming clear and watery, while other little black particles pass downward to the anus.

If a louse be placed on its back, two bloody darkish spots appear; the larger in the middle of the body, the lesser toward the tail. In the larger spot, a white film or bladder contracts and dilates upwards and downwards from the head toward the tail, the motions of which are followed by a pulsation of the dark bloody spot, in or over which the white bladder seems to lie. This motion of the systole and diastole is best seen when the creature begins to grow weak; and on pricking the white bladder, which seems to be the heart, the creature always instantly dies. The lower dark spot is supposed to be the excrements in the guts.

Lice have been supposed to be hermaphrodites, but this is erroneous; for Mr. Lowerboeck discovered that the males have stings in their tails, which the females have not. And he supposes the smarting pain these creatures sometimes give to be owing to their stinging with these stings, when made uneasy by pressure or otherwise. This accurate observer says, that he felt little or no pain from their suckers, though six of them were feeding on his hand at once.

The same accurate observer determining to know their true history and manner of breeding, put two females into a black stocking, which he wore night and day. He found, on examination, that in six days one of them had laid above fifty eggs; and upon dissecting it, he found as many yet remaining in the ovary; whence he concludes, that in twelve days it would have laid a hundred eggs. These eggs naturally hatch in six days, and would then probably have produced fifty males and as many females; and these females coming to their full growth in eighteen days, might each of them be supposed after twelve days more to lay a hundred eggs; which eggs in six days more, might produce a young brood of five thousand; so that in eight weeks one louse may see five thousand of its own descendants. A louse may be easily dissected in a small drop of water upon a slip of glass; and thus placed before the microscope, it is common to find five or six eggs of a size ready to be laid, and sixty or seventy others of different bigness. In the male the penis is very remarkably distinct, as are also the testes, of which he seems to have a double pair, as is also the sting, the structure of which merits a peculiar attention. Lowerboeck's Arcan. Natur. tom. ii. p. 78.

Many animals, both of the quadruped and flying kinds, are subject to lice; but these are of peculiar species on each animal, and are not at all like those which infest the human body. Nay, even insects are infested with vermin, which feed on them and torment them. Several kinds of beetles are very subject to lice; but particularly that kind called

thence the *lousy beetle*. The lice on this are very numerous, but will not be shook off. The ear-wig is often infested with lice just at the setting on of its head; these are white and shining like mites, but they are much smaller; they are round-backed, flat-bellied, and have long legs, particularly the foremost pair. Snails of all kinds, but especially the large naked kinds, are very subject to lice, which are continually seen running about them, and devouring them. Numbers of little red lice, with a very small head, and in shape resembling a tortoise, are often seen about the legs of spiders, and they never leave the spider while he lives, but if he be killed, they almost instantly forsake him. A sort of whitish lice are very common on humble-bees; they are also found on ants; and many sorts of fishes are not less subject to them than the land animals. Kircher says, that he has found lice also on flies. Baker's Microscope, p. 182.

Signior Redi, who has more accurately examined these creatures than any other author, has engraved several species found on different animals. He calls those found on beasts lice, and those found on birds fleas. He is of opinion, that every species of birds has its peculiar sort of flea, different from those of other birds; and has observed that they are hatched white, but that they gradually acquire a colour, like that of the feathers they live among; yet they usually remain transparent enough for a good microscope to discover the motion of their intestines. The kinds he has observed are these: on the hawk three different sorts; on the large pigeon, the turtle-dove, the hen, the starling, the crane, the magpie, the heron, the lesser heron, the swan, the turkey, the duck, the sea-mew, the small swan, the teal, the castrel, the peacock, the capon, and the crow, on each one sort; on the moor-hen three sorts; on the wild goose two sorts; and on the crane, beside the common one, a white sort, marked, as it were, with Arabic characters. Men, he observes, are subject to two kinds, the common louse, and that called the *crab louse*. He also found peculiar sorts on the goat, the camel, the ass, the African ram, the stag, which has, like many of the birds, two kinds, and on the lion and the tiger. The same author has observed, that the size of these creatures is not at all proportioned to that of the animal they are to inhabit, for the starling has them as large as the swan. Redi, Gen. Inf. p. 312.

It is observable, that some sort of constitutions are more apt to breed lice than others; and that in certain places of different degrees of heat, they are very certain to be destroyed upon people, who in other climates are overrun with them. It is an observation of Oviedo, that the Spanish sailors, who are generally much afflicted with lice, always lose them in a certain degree in their voyage to the Indies, and have them again on their coming to the same degree at their return; this is not only true of the Spaniards, but of all other people who make the same voyage; for though they set out ever so lousy, they have not one of these creatures to be found after they come to the tropic. And in the Indies there is no such thing as a louse about the body, though the people be ever so nasty. The sailors continue free from these creatures till their return; but in going back they usually begin to be lousy, after they come to about the latitude of Madeira. The extreme sweats which the working people naturally fall into between this latitude and the Indies, drown and destroy the lice, and are of the same effect as the rubbing over the lousy heads of children with butter and oil. The sweat in and about the Indies is not rank as in Europe, and therefore it is not apt to breed lice; but when the people return into latitudes where they sweat
rank

rank again, their nastiness subjects them to the same visitations of these vermin which it used to have.

The people in general, in the Indies, are very subject to lice in their heads, though free from them in their bodies. The reason of this is, that their heads sweat less than their body, and they take no care to comb and clean them. The Spanish negroes wash their heads thoroughly once every week with soap, to prevent their being lousy. This makes them escape much better than the other negroes who are slaves there, for the lice grow so numerous in their heads, that they often eat large holes in this part.

M. de la Hire has given a curious account of the creature which he found on the common fly. Having occasion to view a living fly by the microscope, he observed on its head, back, and shoulders, a great number of small animals, crawling very nimbly about, and often climbing up the hairs, which grow at the origin of the fly's legs. He, with a fine needle, took up one of these, and placed it before the microscope, used to view the animalcules in fluids. It had eight legs, four on each side; they were not placed very distant from one another, but the four toward the head were separated by a small space from the four toward the tail. The feet were of a particular structure, being composed of several fingers, as it were, and fitted for taking fast hold of any thing; the two nearest the head were also more remarkable in this particular than those near the tail; the extremities of the legs, for a little way above the feet, were dry and void of flesh, like the legs of birds, but above this part they appeared plump and fleshy. It had two small horns upon its head, formed of several hairs arranged closely together; and there were some other clusters of hairs by the side of these horns, but they had not the same figure; and toward the origin of the hinder legs there were two other such clusters of hairs, which took their origin at the middle of the back. The whole creature was of a bright yellowish red; and the legs, and all the body, except a large spot in the centre, were perfectly transparent. In size, the author believes it was about $\frac{1}{1000}$ th part of the bigness of the head of the fly; he observes, that it is rarely that flies are found infested with them. Mem. Acad. Par. 1693.

LOUSE, *Tree*. See APHIS.

LOUSE, *Wood*. See MILLEPEDES.

LOUSE-WORT, in Botany. See PEDICULARIS.

LOUSE-WORT, *Yellow*. See RHINANTHUS.

The Dutch carry on a trade with the seeds and seed-vessels of a species of this plant, resembling the common yellow meadow louse-wort, to Germany, and call it *semen faradillos*; they use it for destroying bugs: for this purpose, they boil a quantity of the seeds and capsules in common water, with which they wash their wainseats, bedsteads, &c. where these insects are lodged; and thus they are effectually destroyed. Miller.

LOU-TCHOU, in Geography, a river of Thibet, which runs into the Sampoo; 22 miles S.W. of Tankia.

LOUTESTINA, a town of Croatia; 12 miles S. of Creutz.

LOUTH, a large market town in the wapentake of Louth Eike, in the Lindsey division of Lincolnshire, England, is situated in a fertile valley at the eastern foot of the Wolds, 26 miles distant from Lincoln, and 153 from London. It was anciently called *Luda*, from its proximity to the Ludd, a small rivulet formed by the confluence of two streams. Among the few historical events relative to Louth, we find that in the rebellion of the year 1536, occasioned by the suppression of the religious houses, the inhabitants took an active part, under Dr Mackerel, who was known by the name of captain Cobler, when the

prior of Barling's abbey, with the vicar and thirteen other ring-leaders, suffered death. In this town were anciently established three religious fraternities, called "The Guild of our Blessed Lady, the Guild of the Holy Trinity, and the Chantry of John of Louth." King Edward VI. alienated the funds of these guilds, and granted them for the purpose of erecting and endowing a free grammar school. The lands then produced 40*l. per annum*, but are now let at 400*l.* One-half of the produce was granted for a head master's salary, one-fourth for the usher's, and the remainder for the perpetual maintenance of twelve poor women. The trustees of this foundation were incorporated by the name of "The warden and six assistants of the town of Louth, and free-school of king Edward VI. in Louth." Another free-school, on a very respectable scale, was founded in pursuance of the will of Dr. Mapletost, dean of Ely, bearing date August 17th, 1677. The church of St. James is a spacious edifice, consisting of a nave, two aisles, with an elegant tower and spire at the west end. The east end, which presents a fine elevation, exhibits a large central window, having six upright mullions and varied tracery, with two lateral windows opening into the aisles. Internally the nave is separated from the aisles by octagonal columns, the alternate sides of which are relieved by single flutes. The chancel, which has an altar piece containing a picture of the Descent from the Cross by William, is of more modern date than the body of the church, and is probably coeval with the justly admired steeple. The latter was begun in the year 1501, and completed in fifteen years. The height was originally 360 feet; but the flat stone on the summit was blown off in 1587, and carried with it part of the building into the body of the church. The whole spire being blown down October 11th, 1634, the present one was erected. The tower part of the steeple consists of three stories: each stage terminates with elegant pediments, supported by ornamental corbels; in this manner diminishing to the top, where are four octagonal embattled turrets. At eighty feet from the base, round the exterior of the tower, runs a gallery, guarded by a parapet wall; and at the height of 170 feet the battlements commence. The top stone projects with a cornice; the height of the spire to the cross is 141 feet; the total height of the whole 288 feet. The living of St. James is a vicarage, in the gift of a prebendary of Lincoln cathedral, to which it was annexed by the Conqueror. The vicarage house, which stands contiguous to the church yard, is an old thatched building; and the present vicar has, in unison with its appearance, laid out his garden in a curious style of ingenious rusticity: it is denominated the hermitage. In Louth was formerly another church, named St. Mary's; it is now totally demolished; but the church-yard is the place of sepulture for the town, as that of St. James has not been used for that purpose for forty years past. The Dissenters from the establishment have three places of worship; one for Catholics, one for Baptists, and one for Methodists. The other principal buildings are a town-hall, an assembly room, and a theatre. The civil government of the town is vested in the warden and six assistants, incorporated, as already mentioned, by Edward VI., who in the same charter granted two markets to be held on Wednesdays and Saturdays, and three fairs to commence on the third Sunday after Easter, St. James's day, and the feast of St. Martin; with a particular injunction, that they should continue two whole days after, that the first day of each fair might be appropriated "to hearing the word of God." Queen Elizabeth gave to the corporation the manor of Louth, of which the annual value was then 78*l.* 14*s.* 4*d.* for the better support of the corporate dignity; and some additional privileges were granted

by James I. In the year 1801, the inhabitants of Louth, as appears by the return under the population act, were 4236, and the number of houses 950; but a considerable increase has been made since that time. A carpet and blanket manufactory has been recently established here, and is now in a very prosperous state; here is also a large manufactory of soap, and a mill for making coarse paper. In the year 1761 an act was obtained for cutting a canal between Louth and the North sea. It commences about half a mile from the town, and keeps parallel with the Ludd, which supplies it with water; leaving the river about four miles from the town, it sweeps to the north and joins the sea at a place called Tetney lock. The undertaking cost 12,000*l.*, which brings in very good interest. By this channel vessels of considerable burthen regularly trade to London, Hull, and several parts of Yorkshire, carrying out corn and wool, and bringing home timber, coals, grocery, &c. In Louth and its vicinity are various springs of a very peculiar nature, worthy of investigation by the philosopher and chemist.

About a mile from the town is the site of Louth Park abbey, which was built by Alexander, bishop of Lincoln, in the year 1139, and appropriated to Cistercian monks. In the time of Henry III. this house contained 66 monks and 150 converts or labourers. Beauties of England and Wales, vol. ix. See also an account of Louth Church and Plan of the Town, published by Mr. T. Esplin, a respectable school-master of Louth.

LOUTH, a county of Ireland, which, though usually reckoned in Leinster, bears a great resemblance in many particulars to the adjoining ones in Ulster. It is bounded on the N. by the county of Armagh; on the N.E. by the bay of Carlingford, which separates it from Down; on the E. by the Irish sea; on the S. by Meath, and on the W. by this last county and Monaghan. It is the smallest county in Ireland; its greatest length being only 21 Irish (near 27 English) miles, and its breadth 14 Irish (18 English) miles. The number of acres in Irish measure is 110,750, equal to 173 square miles, which in English measure is about 177,926 acres, or 278 square miles. Small as it is, it contains 61 parishes in the diocese of Armagh, and its population many years ago was estimated at 57,750. Louth is in general a rich and well cultivated tract, in which there is very little waste ground, and the population of which is very great. Though not deficient in those undulations of the ground which render a country interesting, it cannot be called hilly, except in the peninsula between the bays of Carlingford and Dundalk, and on the confines of Armagh. It is very much under tillage, and more attention is paid to agricultural improvement than in most other parts of the island, which may in great measure be attributed to the exertions of the late lord chief baron Forster, who is called by Arthur Young "the prince of reformers," and of his son the Rt. Hon. John Forster, who has not only followed up his father's measures, but in the high public offices he has held, has been an active promoter of agriculture throughout Ireland, by the laws he proposed for its encouragement. The crops consist of wheat, barley, oats, flax and potatoes, and there is also a great deal of peas and red clover. Limestone is found in a small tract adjoining the county of Meath in the south, in the neighbourhood of Carlingford, and at Cattetown, on the confines of Armagh, but not in the country between Drogheda and Dundalk. This valuable manure is, however, procured at a moderate expence, and contributes to the improvement of the soil. At some depth in the bogs under the turf there is fine white shelly marble in great abundance, which is also found a very useful manure. Those who live near the sea-coast also avail them-

selves of their situation to use weeds which are found there. The mineral treasures of Louth do not seem to be great. Some ochres and soap rock are mentioned, and formerly a lead mine was wrought at Salterstown, on the sea-coast, in the neighbourhood of Cattlebellingham; but the riches of Louth consist in the produce of its cultivated lands. The stone chiefly found is the same as that found in Armagh and Monaghan, and called *whinstone*, but which differs from other stones so called. It is hard, but not so much so as to strike fire with steel. Sir C. Coote says, that it contains 46 parts of silica, 22 of alumine, 28 oxyd of iron, and four of lime in the 100 parts. The principal river of this county is the Boyne, which flowing from Meath, becomes the southern boundary, about two miles W. of Drogheda, and falls into the sea about two miles below that town. It is a river capable of affording great advantages to the country through which it passes. (See BOYNE.) Several other small rivers cross the county and fall into the bay of Dundalk. The towns of Carlingford, Dundalk, Drogheda, and Collon, have been already noticed under their respective names. Of these Dundalk is the assize town, and Drogheda returns one member, so that the county has three representatives. There are in Louth a greater number than in any other part of Ireland of those high artificial mounts, the fortresses of early ages which the Irish call *raths*, and attribute to the Danes. In Wright's Louthiana will be found a full account of these antiquities, many of which are noticed in different articles of this work. Louth was early colonized by the English and was within the Pale. It had a large share of the disturbances which have afflicted Ireland. Beaufort, Young, &c.

LOUTH, a township of Upper Canada, W. of Grantham, and fronting Lake Ontario.

LOUTRA, GREAT and LITTLE, two small Greek islands in the gulf of Engia; seven miles N.W. of Engia.

LOVTZOVA, a town of Russia, in the government of Irkutsk; 10 miles N.E. of Verchnei Udinsk.

LOUVAIN, a city of France, and principal place of a district, in the department of the Dyle. The number of inhabitants is estimated at 18,000, in two cantons, one consisting of 17,796 inhabitants, on a territory of 87½ kilometres in 12 communes, and the other containing 18,230, on a territory of 140 kilometres, in 15 communes. This city was formerly the capital of Brabant, and as some say, probably without sufficient authority, founded by Julius Cæsar, or by one Lupus, who lived long before him; it is certain, however, that this place was known in the year 885, when Godfrey, duke of Normandy, having ravaged the country, encamped near the Dyle, on the plain of Louvain. The emperor Arnulph built a castle about this time to defend the country against the Normans, which was called "Loen," or "le Chateau de Cæsar," Cæsar's castle, and was a long time the ordinary residence of the dukes of Brabant. Here Henry I. was assassinated in 1038; and here also the emperor Charles V. and his sisters, were brought up till the year 1520; and formerly the assembly of states was held here. It was first surrounded with walls in 1165, and much enlarged in the fourteenth century by Wenceslaus and John, two dukes of Brabant. It was formerly much larger and richer than it is now, and its trade was much more extensive. At the commencement of the fourteenth century, 4000 houses were inhabited by clothiers, who employed above 150,000 workmen. It is a traditionary report, that when the weavers left off work, notice was given of it by a large bell, that the children might be kept within doors, to prevent their being thrown down and trampled to death. Hence it became necessary to have more magistrates than in other

other cities, who assenbled in the town-house, which is a beautiful Gothic structure. In the year 1382 the weavers and other tradesmen revolted against Wenceslaus, duke of Brabant, and not only threw 17 of the magistrates out of the windows of the town-house, but proceeded to commit other acts of enormity, and to lay waste the province; but being besieged, they supplicated for mercy and obtained pardon, the most culpable only being punished; and the weavers, who instigated the insurrection, were banished; and most of them retired to England, where they were well received. As Louvain, on this occasion, was nearly deprived of commerce and inhabitants, John IV. duke of Brabant, in the year 1426, founded an university, which was afterwards deemed the ornament and glory of the place, and is said to have resembled our English universities more than any other abroad. In this university there are 60 colleges, which have been much admired for their situation and building, though less sumptuous than those of Oxford and Cambridge. Louvain had also a Dutch college for Roman Catholics, an English one of Dominican friars, an Irish one of secular priests, another of Dominican friars, and another of Franciscans. Here was also a convent of English nuns, reckoned the best of any of this nation in the Low Countries. The trade of this place at present, which is much declined from what it was in the ancient days of its prosperity and glory, is not very considerable, and consists principally in beer, of which a great quantity is sent to Brussels, Antwerp, Liege, Tirlmont, and other cities and towns. Louvain is ill adapted for defence against an enemy, its walls being nine miles in circumference, though not a third part of the inclosed ground has buildings, the vacant space being occupied for gardens and vineyards. It was taken by the soldiers of the French republic by Dumourier, in their hasty progress through Brabant, but evacuated March the 3d, 1793. Louvain was anciently situated partly in the diocese of Liege and partly in that of Cambrai; but when the archbishopric of Malines was erected, it was placed under that diocese, and so it remained till its union with France; 21 miles S. of Antwerp. N. lat. 50 54'. E. long. 4 40.

LOUEGNE, a town of France, in the department of the Ourthe, and chief place of a canton, in the district of Liege. The place contains 1541, and the canton 5925 inhabitants, on a territory of 170 kilometres, in 7 communes.

LOUVET, PETER, in *Biography*, a native of Reinville, near Beauvais, flourished in the seventeenth century, was educated to the profession of the law, and became master of requests to queen Margaret. He was author of several works, which contain much useful and curious matter, and valuable to the historian. Of this description are "The History of the Antiquities of the Diocese of Beauvais;" "Nomenclatura et Chronologia Rerum Ecclesiasticarum Diocesis Bellovacensis;" and "Remarks on the ancient State of the Nobility in the Beauvaisin, and of several French Families." He died in 1646.

LOUVET DE COUVRAY, JOHN BAPTIST, one of the members of the French convention of France, noticed in the article LEWIS XVI. He was of the Brissotine party, and had the courage to oppose the savage Robespierre, when at the very height of his power; yet he escaped the slaughter which that tyrant inflicted on a multitude of good men, and died in the year 1797. He was author of a romance, entitled "The Amours of the Chevalier Faublas;" a political journal, called "The Sentinel;" "A Justification of Paris in 1789;" "Emily de Varmont;" and "An Account of himself, and of the Dangers which he had passed through."

LOUVIERS, in *Geography*, a town of France, and principal place of a district, in the department of the Eure, 12 miles N. of Evreux. The place contains 6500, and the canton 14,444 inhabitants, on a territory of 157½ kilometres, in 22 communes. N. lat. 49 3'. E. long. 2° 55'.

LOUVIGNE-DU-DÉSERT, a town of France, in the department of the Ile and Vilaine, and chief place of a canton, in the district of Fougères; 8 miles N.N.E. of Fougères. The place contains 3060, and the canton 13,435 inhabitants, on a territory of 172½ kilometres, in 8 communes.

LOUVILLE, EUGENE D'ALONVILLE, in *Biography*, a French mathematician and astronomer, who flourished in the former part of the eighteenth century, descended from an ancient family, was born in the diocese of Chartres in the year 1671. He was educated for the naval or military profession: he served in both capacities, and obtained a considerable rank in the army of Philip V. king of Spain. Being disbanded upon the peace of Utrecht, he devoted himself entirely to the study of the mathematics, and particularly to the science of astronomy. About the year 1713 he went to Marseillès, for the purpose of ascertaining the latitude of that place, in order that he might the better compare his observations with those of Pytheas, made almost two thousand years before. In 1714 he was admitted a member of the academy of sciences at Paris, and appointed astronomer at the observatory of that city. During the year 1715 he came into England, in order to observe the total eclipse of the sun in that year, which was to be more perfectly visible in the neighbourhood of London, than in any other part of the northern hemisphere. He was now elected a member of the Royal Society of London; and on his return to his native country, he applied himself most assiduously to his astronomical pursuits. So intent was he in prosecuting his studies, that he became a recluse, who was never to be spoken with but during the time when he was at his meals, and who immediately afterwards withdrew into privacy. Notwithstanding this temper of mind, he was noted for a delicacy and niceness with respect to dress, and articles for the table. In the year 1732 he was attacked with a lethargic disorder, which in a short time terminated his life and labours. He was author of a great number of curious "Dissertations," on physical and astronomical subjects; several of which are inserted in the "Memoirs of the Academy of Sciences," and others in the "French Mercury." Louville was a good mechanic: he possessed a fine collection of instruments, the best of which were made with his own hands. Moreri.

LOUVO, in *Geography*, a town of Siam, seated on a river which runs into the Macon. The situation is so delightful, and the air so salubrious, that the king resides here during the greatest part of the year; 40 miles S. of Siam. N. lat. 14 55'. E. long. 100 30'.

LOUVRE, in *Music*, a well-known dance-tune.

LOUVRE was also formerly the name of the royal palace at Paris.

LOUVRE, *Honours of the*. See HONOURS.

LOUVRES, in *Geography*, a town of France, in the department of the Seine and Oise; 12 miles N. of Paris. N. lat. 49 3'. E. long. 2° 55'.

LOW, EDWARD, in *Biography*, organist of Christ-church college, Oxford, in the seventeenth century. Anthony Wood speaks of him as "a proud man, who could not endure that any one of the waits or common musicians should be allowed to play at the weekly music-meetings, among regular professors and gentlemen performers." Low had

been brought up in Salisbury cathedral, and was appointed organist of Christ-church, Oxford, in 1630, where he was deputy music professor under Dr. Willson; and upon his quitting the university, Low was appointed his successor in the professorship.

Low published, in 1661, an useful little book of "Short Directions for the Performance of the Cathedral Service;" which was reprinted in 1664, under the title of "A Review of some short Directions, formerly printed, for the Performance of Cathedral Service, with many useful Additions according to the Common Prayer-book, as it is now established: published for the information of such as are ignorant in the Performance of that Service, and shall be called to officiate in Cathedral or Collegiate Churches; or any other that religiously desire to beare a Part in that Service, by E. L., Oxon. 1664." Nothing of this kind had appeared since Marbeck's book, in the time of Edward VI.; and as it is now (1804) 140 years since the second edition of Low's little tract was published, it seems high time for another to be drawn up by some regular bred and able organist, or choral performer, in one of the choirs of the metropolis.

Low, at the Restoration, was appointed one of the organists of the chapel royal. He died in 1682, and was succeeded in the king's chapel by Henry Purcell.

Low, THOMAS, a stage singer, with an exquisite tenor voice. His first profession was that of a gold and silver-lace manufacturer; and he began music too late to read it as a language, so that he learned the songs, which he performed in public, by his ear to the end of his life. He stood, however, very high in the favour of lovers of English ballads, particularly those of Dr. Arne at Drury-lane and Vauxhall, composed expressly for his voice and bounded abilities. He was the rival of Beard, and gained as much applause by the sweetness of his voice, through all his ignorance, as Beard, a regular bred musician, brought up in the king's chapel, could do by knowledge of music, humour, and good acting.

We wish not "to draw his frailties from their dread abode;" but we cannot help recording, as a beacon to other popular singers, that Low was profligate, extravagant, and unprincipled; which rendered the latter part of his life disgraceful and wretched. From acquiring unbounded applause, and an income of more than 1000*l.* a-year, he was reduced to the lowest state of indigence, and degraded into a chorus singer at Sadler's Wells, Cuper's Gardens, and even a ballad-singer in the streets.

Low Airs, in Horsemanship. See AIRS.

Low-Bell, in Birding, a name given to a bell, by means of which they take birds in the night in open champaign countries, and among stubble in October. The method is to go out about nine o'clock in a still evening, when the air is mild, and the moon does not shine.

The low-bell is to be of a deep and hollow sound, and of such a size, that a man may conveniently carry it in one hand. The person who carries it is to make it toll all the way he goes, as nearly as may be, in that manner in which the bell on the neck of a sheep tolls, as it goes on while it feeds. There must also be a box made like a large lanthorn, about a foot square, and lined with tin, but with one side open. Two or three great lights are to be set in this, and the box is to be fixed to the person's breast, with the open side forwards, so that the light may be cast forward to a great distance; it will spread as it goes out of the box, and will distinctly shew the person who carries it whatever there is in a large space of ground which it extends over, and consequently all the birds that roost upon the ground. Two

persons must follow him who carries the box and bell, one on each side, so as not to be within the reach of the light to shew themselves. Each of these is to have a hand-net of about three or four feet square, fastened to a long stick or pole; and on which ever side any bird is seen at roost, the person who is nearest is to lay his net over it, and take it with as little noise as possible. When the net is over the bird, the person who laid it is not to be in a hurry to take the bird, but must stay till he who carries the light is got beyond it, that the motions may not be discovered. The blaze of the light, and the noise of the bell, terrify and amaze the birds in such a manner, that they remain still to be taken; but the people who are about the work must keep the strictest quiet and stillness that may be.

Some people are fond of going on this scheme alone. The person then fixes the light-box to his breast, and carries the bell in one hand, and the net in the other; the net, in this case, may be somewhat smaller, and the handle shorter. When more than one are out at a time, it is always proper to carry a gun. It is no uncommon thing to espy a hare when on this expedition; and, in that case, it is better to shoot her, than to trust to the taking her in the net, for she will very easily escape from that.

Some tie their bell to their girdle, and carry the light in their left hand, and the net in their right; the light is not to be so large in this case, and the other way is therefore rather the better.

Low-Bellers, in our Statute-Books, are persons who go in the night-time with a light and bell, by the sight and noise whereof, birds sitting on the ground become stupefied, and so are covered with a net, and taken.

Low Countries, in Geography. See BRABANT, FLANDERS, and NETHERLANDS.

Low Countries, School of Engraving of the. It has been deemed eligible to adopt the usual classification, and follow the examples of the continental writers upon art, in arranging our schools of engraving. Those writers have thought proper to unite the schools of Holland and of Flanders under the general head of "l'Ecole des Pays bas;" and as our Cyclopædia had advanced beyond the letter D, before it was determined to cluster our biographical notices of the professors of this art, in schools and in chronologic succession, it is presumed the expediency of this arrangement will need no further argument in its recommendation, or reason for its adoption.

The literati and connoisseurs of the Low Countries have not been insensible to the anxieties which usually attend on the patriotism of art and scholarship, and have taken some small part in the controversy respecting the invention of letter-press engraving and printing: but the feeble pretensions of Laurence Collet of Haerlem to this fancied honour, though once strenuously asserted by Meerman, by Bokhorn, and by Junius, have been patiently resigned, and gradually withdrawn; and the story of his wandering in a wood near Haerlem, and printing from the bark of trees, refuted by the baron Heinniken, is no longer listened to with the smallest degree of credit, beyond the suburbs of the good city of Haerlem.

But the Low Countries may claim the more worthy rivalry, and the more solid distinction, of having given birth to some of the most justly celebrated engravers on copper: and the prescience and display of superior and original skill, are surely a more noble ground of contest, than the fortuitous concurrence of casual discovery, however important in its consequences.

We have already mentioned the Gothic engraving of the Holy Virgin, which is in the royal collection, and other prints,

LOW COUNTRIES, ENGRAVERS OF THE.

prints, that with the most show of reason have been presumed to be the work of *COSTER* (see that article); but if that artist, or that person rather, died in the year 1441, as is reported, how happens it that we hear so little more of letter-press engraving in the Low Countries till the time of *Van Assen* and *Peter Coeck*, who were neither of them born till toward the close of the fifteenth century?

A rude print, designed in a stiff and Gothic style, and executed in a barbarous taste, was some years ago preserved in the library of the king of France. It had formerly belonged to the celebrated *abbé Marolles*; was believed by the connoisseurs of Paris (perhaps with reason) to be the most ancient of the Flemish productions in this art; and is inscribed, in the old black letter, "*Gheprint t'Antwerpen by my Phillery, de Figur Snyder,*" i. e. in English, "*Printed at Antwerp by me, Phillery, engraver of figures.*"

The subject of this ancient engraving, which appears to be executed on wood, is a female figure sitting with a dog on her lap, near whom are two soldiers standing; but if it has been inferred to be the first, merely because it is among the very rudest and worst of Flemish productions, we can by no means acquiesce in the justness of such a criterion; and of *Mynheer Phillery*, the *figur Snyder* and printer, nothing further is known.

If we except the doubtful claims of *Phillery*, *Lucas Jacobs* of *Leyden*, *Peter Coeck* of *Alost*, and *John Walther* of *Assen*, who were contemporaneous, were the earliest engravers of the Low Countries with whose names and works we are acquainted. The former is believed to have introduced into his country the art of engraving on copper, and the method of printing with the rolling-press; and the two latter, that of engraving on wood, or so as to deliver impressions from the surface of the work, and with the letter-press; and all, though not the proclaimed and personal disciples, were evidently the students and imitators, of *Wolgemuth*, *Schoen*, and *Durer*. The internal evidence arising from comparing their styles of art, with those of the early German masters, is at least as satisfactory a proof of such a fact, as could have been derived from the testimony of contemporary writers: for mere writers upon art, partly from want of practical knowledge, and partly from the mistakes of inadvertency, have not unfrequently recorded errors; which errors sometimes continue for ages to be repeated, and to flow on through the usual literary channels, until they are detected and dragged ashore by the local knowledge and power of professional artists, or the cultivated eye and matured judgment of unassisted connoisseurship.

On comparing dates, it appears that the birth of *Jacobs* was four years posterior to those of *Coeck* and *Walther*, though he preceded them in the practice of engraving.

Peter Coeck, or *Koeck*, was born in the year 1490, at *Alost*, in *Flanders*, and died in the same city A.D. 1550. From *Barent Van Orley*, of *Brussels*, he obtained some instructions in drawing, after which he travelled to *Italy* for improvement, where he made very considerable progress in his studies, and from whence he made a voyage to *Turkey*.

On his return he married, and settled in his native town, where he enjoyed a small pension from the government; but his wife dying soon after, he removed to *Brussels*, and engaged to paint for a company of merchants, who had conceived the project of establishing a manufacture of tapestry at *Constantinople* under his direction.

During his residence abroad, he had made drawings of that magnificent city and its suburbs; which, on the failure of the tapestry scheme, he cut on seven wooden blocks, divided into as many compartments, which being joined together,

make a very large, long print, resembling a frieze. On a tablet belonging to the first block is written in bad French, "*The Manners and Customs of the Turks, with the Countries belonging to them, drawn from Nature by Peter Coeck of Alost, when he was in Turkey, in the year of Jesus Christ MDXXXIII.*" He also with his own hand executed these prints according to the drawings he had made." And upon a tablet in the last block, in the same language is inscribed, "*Mary Verhulst, widow of the said Peter d'Alost, who died in the year 1550, caused these figures to be printed under the grace and privilege of his imperial majesty, in the year MCCCCCLIII.*" The principal subjects of these blocks are, 1. The March of the Grand Seigneur with his Janisaries. 2. The Suite of the Grand Seigneur walking. 3. A Turkish Marriage, with the Ornaments and Dances of the Country. 4. Their Funeral Ceremonies. 5. Their Rejoicings on the New Moon. 6. Their Repasts. 7. Their seafaring and warlike Customs.

After *Coeck* returned to his native country, he married a second time, *Mary Verhulst*, and had a daughter, who afterwards married his pupil, *Peter Breughel* the elder. Besides many altar and cabinet pictures, executed by *Coeck*, he translated from the Italian the works of *Sebastian Serlio*, and *Vitruvius*; contributed greatly to the improvement of the architecture of his country; and was honoured with the title of first painter to the emperor *Charles V.*

Strutt says of his engravings, that they contain a vast number of figures, executed with great care, but not much taste: but that they are very curious, and were doubtless very estimable at the time they were performed. He usually marked them with his initials in the form of a monogram, which will be found in our *Plate I.* of those used by the engravers of the Netherlands.

John Walther Van Assen was also born in the year 1490, and in his youth flourished at *Amsterdam*, but the events of his life are very obscure. He engraved on wood with a degree of boldness superior to that of the age in which he lived: his invention was copious; and the heads of his figures often expressive. His print of "*Christ praying in the Garden*" has been particularly admired, and very justly so, when regarded with reference to the time and place in which he lived: but the forms of his naked, as might be expected, are Gothic, meagre, and ill drawn.

Walther commonly marked his engravings with his initials, combined in a cypher, and as if inscribed on a tablet, as may be seen in our first plate of the monograms, &c. used by the engravers of the Low Countries; and the best list which we are able to form of his works is as follows.

A set of six, of the circular form, about nine inches in diameter, from the *Life* and *Passion* of *Christ*. They are dated in the years 1513 and 1514; marked with the cypher of the artist; and each print is surrounded with a sort of Dutch grotesque ornament. Their subjects are, "*The Scourging of Christ*;" "*Our Saviour at Prayer in the Garden of Olives*," wherein his three disciples are represented asleep, and the Jews are advancing, conducted by *Judas*; (this is the print distinguished above for its superior merits;) "*Christ taken into Custody, with St. Peter cutting off the Ear of the Servant of Malchus*;" "*Christ bearing his Cross*," with the procession to mount *Calvary*; "*The Crucifixion*," in which *St. John* and the holy women are introduced at the foot of the cross; and "*Jesus laid in the Sepulchre*," attended by *Joseph of Arimathea* bearing a vase of ointment.

Another set of seven plates in folio, each consisting of six different subjects contained in architectural compartments, with descriptions in the Dutch language. The subjects are partly

partly historical and partly allegoric; some are from the Christian, and others from the heathen mythology; and it would be difficult, if it be practicable, to connect the whole on principle. The seventh print is inscribed "Gheprint tot Aemstredam, by Doen Pieter toon in Enghelenburch," and all are marked with the monogram of the artist.

Beside these, are some processions, of which we know not the titles or number, from the graver of Walther of Assen, and a small upright print of an armed figure on horseback, with the ensign of the castle of St. Angelo, inscribed "St. Hadrianum. Amstelodamus in Ædibus Donardi Petri ad signe Castri Angelica." The whole are after his own compositions.

Lucas Jacobs of Leyden, the earliest engraver on copper that the Low Countries produced, was an honour to his age and country. His country appears to have thought so, and hence in some parts of Europe his family name is nearly lost, and he is universally known by the appellation of Lucas van Leyden.

Lucas was born in the year 1494, and was the son of Hugues Jacobs, a painter, but not of much talent or reputation, and whose chief glory has been reflected from the brightness of his son's abilities. Obtaining a rudimental acquaintance with art under his paternal roof, Lucas began, even during the age of adolescence, to distinguish himself by his drawings and his extraordinary attempts in the arts of painting and engraving. He finished his elementary studies in the school of Cornelius Engelbrecht, who was then in the height of reputation. But perhaps his greatest happiness as an artist, consisted in his living at the same period with Albert Durer, between whom and himself the most intimate and sincere friendship, and the utmost freedom and liberality of professional communication, subsisted: for Durer, who was the senior of our artist by more than twenty years, on seeing some of his youthful productions, is said to have conceived for him the most lively esteem, which gave birth to a correspondence, generous and disinterested at first on the part of the German, and which by degrees grew familiar and friendly on both sides. The biographers of Lucas have reported, that between the age of nine years and twelve, he executed a print of St. Hubert, for which he was rewarded by a certain burgomaster with as many guilders as he was years of age. The present writer has not seen this juvenile production, nor has he found it mentioned in those foreign catalogues which he has consulted of the works of our artist. He therefore presumes it may have been a copy, done for practice and improvement in the new art, of the justly celebrated work of Albert Durer, which is thus entitled, and that it was probably among those early and surprising productions which called forth the favourable notice of the artist of Nuremberg, and became the basis of the subsequent intimacy between Albert and Lucas, which ended but with the life of the former.

Each of these distinguished artists regularly sent as presents to his friend, selected impressions (for the mercantile trickeries of proof-taking and proof-making had not then been invented) of every engraving which he published; and when Durer was driven from Nuremberg by the ill-temper of his wife, he sought refuge at Leyden, was received by Jacobs in the most cordial and affectionate manner, and to commemorate their mutual friendship, besides painting each other's portraits, they executed a picture in conjunction on the same pannel.

It should have been mentioned before, that Lucas acquired his knowledge of the use of the graver in the workshop of a goldsmith of Leyden, and that of the process of etching, he obtained from an armourer of that city, who employed

the corrosive power of aquafortis in ornamenting cuirasses, and other conspicuous parts of plate armour. The present writer has, in another work, stated his conjecture, that the ancient corroded sword-blades of Syria and Damascus are the probable origin of the art of etching on copper, and now suspects that he may have been mistaken in attributing (as he has done under the article *ETCHING*) its invention to Albert Durer. He now thinks it not improbable that Lucas imparted this art of corrosion to his friend, either by letter, or, he should fancy, during the residence of the latter at Leyden, if there were not grounds for supposing that this journey was not undertaken until after the year 1516, when Durer's first etching (of which the subject is the rape of Proserpine) was produced. And he thinks so the rather from reflecting on the generally received report, that the two earliest of Albert's etchings were performed on plates of iron or steel: yet Lucas's etching of St. Catherine, which is believed to be his first production in this art, did not appear until the year 1520.

Lucas of Leyden was frank, generous, and urbane, as well by nature as by habit; yet his generosity in some instances was requited with ingratitude; and his urbanity, if we might credit the tale which is related below, did not shield him from the shafts of envy and malevolence. Conspicuous by his rare and singular endowments, and unremitting in his habits of professional industry, the novelty, beauty, and number of his publications could scarcely fail to enrich him. Strutt says "he gained much money by his profession, and being of a generous turn of mind, had not the least notion of shutting up his money in his chest; on the contrary, he spent it freely, dressed well, and lived in a superior style."

To enjoy his popularity, or improve his taste, he made a journey into Zealand and Brabant, at the age of thirty-three, giving entertainments to the artists in most of the great towns and cities through which he passed; and it is reported, that during this journey, a slow poison, which was fatal to our artist, was administered to him at one of these entertainments by a painter of Flushing, who was envious of the fame which followed the exercise of his various talents. But the honour of human nature should perhaps incline us not to listen too readily to stories of this kind. No delicacy should have led, and no pardon was likely to lead, to the repression of the name of the author of a deed so atrocious. Yet he was never pointed out: and it must be a slow poison indeed! that is six years in effecting its purpose.

It seems more worthy of belief that the real poison of Lucas van Leyden, consisted of a mixture of the occasional excesses of convivial indulgence, with habits of intense professional application. Contraries which can never assimilate, few constitutions can endure; and so anxious and unremitting was the application of Lucas, that he found the day too short for his purpose, and frequently consumed great part of the night also in his studies.

Even during the last six years of his life, while he lay pining under the pressure of disease, or at least oppressed by a sickness under which ordinary minds would have languished, his industry and love of art were eminently conspicuous. When it was represented to him that such close attention did but increase the malignity of his disorder, he calmly replied, "I am content it should be so, since, by my studies, I endeavour to make my bed of sickness a bed of honour. An artist can never die in a more suitable manner than with his pencil in his hand."

He died accordingly at the age of thirty-nine in his native city, and in the year of our Lord 1533.

Beside engraving both on copper and on wood, Lucas painted in oil, in distemper, and upon glass, exercising the latter

latter art by a process that is known to few if any of its modern practitioners. He commonly marked his works with the sort of Gothic L, which will be found in our first plate of the monograms. &c. of the engravers of the Low Countries, sometimes adding the date of the year, and inscribing both on a tablet.

Vafari says, that "perhaps Lucas equals any of the best artists in the management of the graver; that his historical subjects are executed with great truth, and that he knew well how to group his figures without creating confusion in his prints;" but is certainly too laud in his praise, where he adds, that "he surpassed Dürer in composition, and succeeded in representing aerial perspective with the graver, as well as could have been done with the assistance of colour."

A juster estimate of his merits may be found in the biographical dictionary of our countryman Strutt, who affirms that his style of engraving differed considerably from that of Albert Dürer, and seems evidently to have been founded upon the works of Izaak van Meckeln. His prints are very neat and clear, but without any powerful effect. The strokes are as fine and as delicate upon the objects in the front, as upon those in the distances; and this want of variety, joined with the feebleness of the masses of shadow, give his engravings, with all their neatness, an unfinished appearance, much unlike the firm, substantial effect, which we find in the works of Albert Dürer. He was attentive to the minutie of his art. Every thing is carefully made out in his prints, and no part of them is neglected. His figures are generally tall and thin; the attitudes well chosen, and frequently graceful and elegant. In these he followed nature simply, without affectation. He gave great character and expression to the heads of his figures; but on examination of his works, we find the same heads too often repeated. The hands and feet rather mannered than correct; and when he attempted to draw the naked figure, he succeeded but indifferently. He affected to make the folds of his draperies long and flowing; but his female figures are frequently too excessively loaded with girdles, bandages, and other ornamental trappings, that much of the elegance of the design is lost; and that native simplicity, which is, as it were, the very soul of painting, is destroyed.

To Adam Bartsch of the Imperial library at Vienna, the public is indebted for a catalogue raisonné of nearly two hundred of the engravings of this master, all of which are the produce of his own fertile invention. About twenty woodcuts have also been ascribed to him, but of which he was probably only the designer. Mariette, however, possessed two hundred and thirty of his prints.

As nothing like an English catalogue has yet appeared, we shall name as many as we are able, beginning with those subjects which he has taken

From the Old Testament.—"The History of the Creation, and the Fall of our first Parents," in a set of six fine prints of small folio size, engraved A.D. 1529; of which the subject, 1. God, (represented by the figure of an old man,) creating Eve during the Sleep of Adam. 2. God laying the Injunction on Adam and Eve not to touch the forbidden Fruit. 3. Eve, seduced by the Serpent, persuading Adam to eat of the Fruit of the Tree of Life. 4. Adam and Eve expelled from Paradise. 5. Cain slaying Abel. 6. Adam and Eve deploring the Death of Abel, who is extended before them. "Adam and Eve, Fugitives, after being turned out of the terrestrial Paradise," in 4to. size. Lucas has treated "The Trespass of Eve," and "The Death of Abel," in a different manner, on six small plates; "Lamech standing, bending his Bow, and Abel sitting at the Foot of a Tree, with the Jaw-bone of an Ass before him," in 8vo.; "Abraham

and the three Angels," of quarto size; "Lot and his Daughters escaping from the burning City," a very fine engraving, dated 1530, companion to "The Sin of Adam and Eve," in small folio; "Abraham sending away Hagar and Ishmael," a middling-sized plate, lengthways, dated 1510; and known among dealers by the name of the large Hagar. The same subject otherwise treated, called the little Hagar, of 4to. size, dated 1516. The History of Joseph, in five 4o. prints, dated 1512; and of which the subjects are, 1. Joseph recounting his Dreams to his Brethren. 2. Joseph solicited by the Wife of Potiphar. 3. The Wife of Potiphar accusing Joseph. 4. Joseph in Prison, explaining the Dreams of the Officers. 5. Joseph interpreting the Dreams before Pharaoh. "The Daughter of Jephtha meeting her Father," one of the earliest productions of Lucas, engraved some time about the year 1508; "Dalla cutting off Sampson's Hair," "David and Goliath," and "David playing the Harp before Saul," all in folio; "David supplicating in behalf of his People," a large print. The same subject differently treated, an etching, dated in 1520. "Solomon worshipping the Idols," in quarto; "Elisha before king Ahazueras," a large folio plate; the proof of which, in the royal collection at Paris, cost two hundred and fifteen livres, according to the note of P. Mariette written at the back of the print. "Susannah and the Elders," of 4to. size, dated 1508.

Subjects from the New Testament.—"St. Joachim embracing St. Anne," dated 1520; "The Annunciation," "The Visitation," both of octavo size; "The Adoration of the Magi;" this is esteemed one of the most considerable works of the master, it is dated 1513; and of large folio size. "The Repose during the Flight into Egypt;" "Jesus baptized in the River Jordan," a very grand composition, containing a very numerous assemblage of figures, and engraved about the year 1510; "Jesus tempted by Satan in the Desert," dated 1518, all of quarto size; "The Resurrection of Lazarus," a grand composition, engraved in the year 1508. folio size; "The Passion of our Saviour," represented in fourteen plates, engraved A.D. 1521, and entitled as follows, viz. 1. The Last Supper. 2. Jesus on the Mount of Olives. 3. Our Saviour seized in the Garden of Olives. 4. Our Saviour taken before the High Priest. 5. Jesus reviled. 6. The Flagellation. 7. Jesus crowned with Thorns. 8. Jesus exposed to the People. 9. Christ bearing the Cross. 10. The Crucifixion. 11. The Descent from the Cross. 12. Our Saviour laid in the Sepulchre. 13. The Descent into Hell. 14. The Resurrection. Another set of "The Passion of our Saviour," in nine circular plates, eight inches in diameter. A grand "Ecce Homo," very rich in composition, containing more than a hundred figures, one of the best engravings of Lucas, dated 1510. in large folio. "Jesus-Christ on the Cross, between the two Thieves," a very fine print, nearly as rich in composition as the preceding, having twenty-four figures admirably grouped: the good impressions of this plate are very seldom to be met with, it is dated 1517, and in large folio. "Our Saviour appearing to Mary Magdalen as a Gardener," both half figures, placed before the sepulchre, in 4to. and dated 1519; "The Return of the Prodigal Son," a folio print, admirable for the spirited execution of the back-ground and small figures, engraved A.D. 1510.

Various Devotional Subjects.—"The Virgin and Child, accompanied by St. Anne," dated 1516; "The Virgin and Child, standing on a Bishop's Crozier;" "The Virgin and Infant Jesus," 1514; "A Holy Family," in quarto; "The Virgin and Holy Infant, contemplated by two Angels," in quarto. Jesus Christ and his twelve apostles, in a

set of fourteen plates, of octavo size. The four Evangelists, occupied in writing the gospel, half-length figures, in 8vo. St. Peter and St. Paul, half-length figures, octavo size. Another plate of the saints "Peter and Paul," in a landscape; a very fine engraving, dated 1527. "The Conversion of St. Paul," a very grand composition, in large folio, dated 1509. "Saint Christopher," in which he appears sitting at the foot of a rock, on the banks of a river: on one side of the saint, in the back-ground, is a hermit, coming out of his cell with a lantern. This print is one of the earliest productions of Lucas, done apparently about the year 1508, of octavo size. "Saint Christopher in the Water, with the Infant Christ on his Shoulders," a small print.

Albert Durer engraved and published the same subject in the course of the same year, and it is supposed the two artists worked in concurrence. "St. John the Baptist," dated 1513. "The Decollation of St. John the Baptist," both in octavo; "St. Jerome," the head surrounded with rays of glory, sitting in an alcove, with a skull before him. Lucas engraved this subject three times; but the print which is treated in the best manner is dated 1521, in quarto. "St. Sebastian," in which the holy martyr appears fastened to a tree, with his body pierced by arrows, in octavo, engraved probably in the year 1508; "St. Antony," habited in a long robe, with a monk's cowl on his head, and a great number of accessories, in octavo; "The Temptation of St. Antony," where he is represented seated on a hillock between two trees, looking at a figure, whom he perceives to be a female devil, from the horns sticking through her head dress. The back-ground is a mountainous landscape, with an old castle; a very fine print, dated 1509, in quarto. "St. Dominic," surrounded by rays of glory, holding a staff, terminated by a crucifix: behind him is a dog, holding in his mouth a flaming torch, in octavo, engraved some time about the year 1514. "St. Gerard Sagredus," a bishop and martyr, his head covered with an episcopal mitre, surrounded with rays of glory: he holds in his hand a heart pierced with an arrow, octavo. "St. Francis receiving the Stigmatics," from a crucifix suspended in the air: at the bottom of the print is a Capuchin monk, sitting at the foot of a tree, in octavo. "St. George liberating the Princess of Antioch," whom he has rescued. In this, as in many other old prints, the action is double: in other words, two points of time are represented, for in the back-ground is St. George combating the dragon, and the princess chained against a rock; engraved in 1508. "Mary Magdalen entering into worldly Pleasures," a celebrated print, of large folio size, known among the amateurs under the name of "The Magdalen's Dance:" in one part of the print she is represented dancing with a man to a flute and tambourin, with various other groups: lower down she is represented on horseback, at the head of a troop of huntsmen; and again flying towards a wood with three men, one of whom sounds a horn: and towards the summit of a rock is the soul of the Magdalen ravished in the air by four angels. This fine print was engraved about the year 1519, when the artist was in his meridian. "The Magdalen in a Desert at the Foot of a Rock;" in the clouds is represented the eternal father with a long beard, and a tiara on his head. This is without date, but is doubtless one of the earliest productions of Lucas, while his powers of drawing and composition were yet feeble, and is better engraved than it is designed. "The Magdalen standing on a Cloud, holding a Vase:" to this print has been mistakenly given the appellation of "Pandora letting out the Evils of the World;" it is dated 1518, and of octavo size. There is in existence a print of this subject, marked with the initials I. V. M. which has been attributed

to Israel Von Mecheln; but, on comparison, it appears to be a bad copy of the engraving by Lucas, by an unknown hand. "St. Catherine," a half-length figure, crowned with rays of glory, leaning on a wheel, with a book and sword. It is an etching, touched in some parts with the graver, and dated 1520.

Profane Subjects.—"Mahomet sleeping, with a Priest murdered by his Side, and another Figure stealing his Sword," a folio print, said to be one of his earliest productions; the seven cardinal virtues, sitting figures, each crowned by an angel, dated 1530, viz. 1. Faith. 2. Hope. 3. Charity. 4. Prudence. 5. Justice. 6. Fortitude. 7. Temperance. "The Death of Lucretia," dated 1512, which print is by some called "The Death of Dido," in octavo; "The Death of Pyramus and Thisbe;" "The Poet Virgil, suspended from a Window in a Basket, to the Derision of the Populace;" a small folio print, executed with great taste and spirit, and very correctly drawn, and well composed. Vafari, who speaks very highly of this print, says, that "Albert Durer was so sensibly struck with the merit of it, that he afterwards wished to concur with Lucas in producing a pair of prints that should correspond in form, moral, and dimensions, to which desire we owe the celebrated print of "Death's Horse." The two prints do correspond in these respects: yet the inadvertency of Vafari in this place, which has been repeated by Huber and Rost, has not hitherto been pointed out. To make any thing credible of this story, the order of the facts and persons must be reversed; for the "Death's Horse" of Albert Durer was produced to the public in the year 1513, whereas Lucas of Leyden did not publish his suspended poet till 1525. And what renders the non-detection of this error the more surprising and remarkable is, that both these engravings bear their respective dates; the latter on a fragment of broken stone at the left-hand corner of the print, the former immediately above the monogram of Albert on his usual tablet.

The emulation must, therefore, have been felt by Lucas, and his engraving of "The Courtezan suspending Virgil in a Basket," which, of all his works, approaches nearest, in point of style, to this exquisitely finished print from the graver of Durer, must have been produced accordingly.

The recondite moral and meaning of these compositions, and intentions of their authors, will then stand thus. Albert Durer had produced a justly admired engraving, by some vulgarly termed "Death's Horse," by others "The Worldly Man," but wherein a cavalier, completely armed, sallies forth on the business of Death. His steed is richly harnessed; his helmet studded and wrought with ornaments; and his armour, in the fine impressions, appears as if of silver, and of costly workmanship. He is a hero, and perhaps intended by Albert for some Alexander, or individual general of renown. Whilst he is gravely bent on the pursuit of that glory which arises from the destruction of his fellow men, a crowned spectre, which seems intended for Death, crosses the warrior's way: he is mounted on a mule, holds up an hour-glass with an index before the hero, and seems to scoff at his purpose; while a frightful monster, with various horns, like one of those mentioned in the Apocalypse, and which is probably intended for the Devil, follows hard after him, intent and ready to seize on his prey. The moral has various accessories, such as a lofty castle in the back-ground, and a lizard crawling in the road, whose allegorical office is to warn man of danger. A warning bell, too, hangs from the neck of the mule, on which rides the spectre, while to the comparison of the warrior's steed, the jingling bell of Folly is appendant.

It is altogether a profound pictured allegory, worthy of serious contemplation, and dictated by the same muse who afterwards prompted Dr. Young to write

"Deaths stand, like Mercuries, in ev'ry way,
And kindly point us to our journey's end."

It appears to the present writer, that, struck with this extraordinary display of the various powers, as poet, painter, and engraver, of his friend Durer, the Dutch artist became laudably ambitious of designing and executing a fit companion to a production which must doubtless have been very popular; and, accordingly, institutes and stimulates a comparison between the love or lust of conquest and false glory, and that of woman, and with much ingenuity calls on the spectator to behold and balance their absurd and pernicious consequences.

A pictorial comparison is thus provoked between the moral consequences of the abuse of two potent passions; and if it might be granted that we perceive the little distant figure, whom, in the print of Lucas, the courtesan suspends in a basket, and exposes to the derision of the populace, to be the poet Virgil, the moral effects would be heightened by the reflection, that it is the organ of Fame, and dispenser of terrestrial immortality, who is thus himself made to appear infamous and ridiculous, as in the print of Albert it is the destroyer who is the victim.

But of this it requires that the spectator be informed by Lucas, or by Vafari; for as the costume and characters (as in all the works of this master) are perfectly Dutch, no other men would dream that a small distant head, covered with the mitre of episcopacy, or the cap of folly, was that of the Mantuan bard.

This engraving is, however, with regard to composition, manual execution, high finish, and actions and expression of the figures on the fore-ground, particularly that of the principal male figure, one of the very best of the works of Lucas van Leyden.

To quit this digression, and resume our list of the subjects which he has designed and engraved from profane history, and his own fancy. "Venus, the beautiful Goddess of Love," a 4to. plate, dated 1528. A folio plate of "Mars and Venus," with armour and an attendant cupid, was executed during the long illness of the artist; as was also "The Goddess Pallas," armed with her ægis and spear. The latter was the last plate which he engraved, and it is said, that a short time before he died, he requested to see it; upon which occasion it seems probable, that he used those remarkable words, so much to his honour as an artist, which we have cited in his biography. "A military Officer displaying a Flag." The attitude of the figure is very spirited and soldier-like, and the print altogether is very beautifully finished; both are of octavo size. "Four Soldiers in a Forest," without a date, but probably engraven about the year 1508. A very fine print of a young man at the head of a party of soldiers, listening attentively to a man, with his hat in his hand: on each side is represented a group of three men conversing. "The Beggars," one of whom receives a platter from the other: the group is completed by a female figure, with her hand on her breast. This print appears to have been engraven about the year 1508. "The Promenade;" the back-ground represents a mansion situated at the foot of a mountain, which terminates the view, dated 1520. "The Earl and Lady, with a Falcon;" this is drily executed, and appears to have been engraven about the year 1508. "The Wood Nymph," she is walking with a peasant, and another figure conducting

them; all of octavo size. [Note.—There is a copy of the Wood Nymph, engraved by Wierix at the age of twelve.] A man with a lighted torch, conducting a female, followed by a man with a sabre, and a club across his shoulder: this print is very delicately executed, apparently about the year 1508. A female figure presenting a vase to a man; the landscape is terminated by a mountain, the summit of which is crowned with an ancient castle, dated 1520, of octavo size. "The Pilgrims," consisting of three figures, quarto size; "The wedding Ring," representing a man giving a ring into the hand of a young woman, seated by his side. This rare print is etched in a firm style, dated in 1520, and distinguished by the neatness of the execution, in quarto. "The Fool," representing a female figure, defending herself from the embraces of a fool, characterised by his dress and baubles, both half-length figures. This is an etching, slightly touched with the graver, and dated 1520. "The old Man with a Bunch of Grapes," a half-length profile. This print is admirably touched, and appears to have been done about the year 1523, when the artist was in his meridian. "The young Trumpeter," representing a boy blowing a trumpet, to the sound of which two others are dancing; one of the earliest productions of Lucas. "The Woman and the Bitch," representing a female with her head enveloped with drapery, the ends of which hang in folds over her body; towards the left are perceived the head and foot of a bitch, whom the lady is feeding with fruit. This print is executed on a white ground, and dated 1509. Another "Woman and Dog," dated 1510; "The Musicians," a very fine print, dated 1524, consisting of a man playing a guitar, and a woman playing a violin; "The Surgeon," performing an operation behind the ear of a peasant, whose countenance tells us plainly how much he suffers, dated the same as the preceding; "The quack Doctor," operating with an instrument in the mouth of a peasant, who with great vexation perceives that, during the operation, a girl behind him is emptying his purse of its contents. This print possesses equal merit with the two former, and is dated 1523; all of octavo dimensions. "The Milkmaid," holding in one hand her bonnet, and in the other a pail, into which she is about to milk a cow held by a peasant. This is a very rare print, dated 1510, of quarto size. "Uylenspiegel," or "L'Espegle," the scarcest of all the works of this master. It was in the collection of the king of France, and mistakenly said by Marolles, and other French connoisseurs, to be unique. Basan informs us, that M. Mariette had also an impression of this plate, and several are known to exist in England. It represents a man playing upon the bag-pipes, carrying two children in a basket, and a woman with an infant in her arms. It is nearly seven inches and a half high, by four inches and three quarters wide; and has been copied of the same size several times. One of the copies is by Hondius; but the best has no name to it. This rare print is dated 1520.

Various Ornaments.—The profile of a warrior's head in a medallion, surrounded with ornaments. It is dated 1527, and marked with the letter L, on a cartouche at the bottom. A composition of ornaments in the taste of that age, composed of a ram's skull and two fish, dated 1527. Another composition of ornaments, with a Mercury sitting between two sphinxes, folio size, dated 1528. A pannel of ornaments, composed of a marine deity with a trident, surrounded by sirens and chimæreæ, executed on a black ground, in octavo, and dated 1528. "The Infant Warriors," one of whom displays a flag, and the other carries a helmet; and "The Arms of the City of Leyden," in a

LOW COUNTRIES, ENGRAVERS OF THE.

small circle, surrounded by four others, each containing a genius, engraved some time about the year 1510, both of octavo size.

Portraits.—The emperor Maximilian I. with his hair plaited and wearing a large hat. Lucas painted the portrait when the emperor visited Leyden, but did not engrave it till the year 1520, after the death of that prince. The head is entirely engraved, and the remainder etched, and slightly touched with the graver to give it effect; in the back-ground is a little figure holding a scroll, marked with the letter L. This is the finest portrait Lucas ever engraved; very rare, and of folio size. A portrait of the artist himself, represented with a hat on, and a mohair doublet trimmed with fur. This portrait was drawn and etched by himself when he was but twenty years of age; it is touched in a light spirited manner, and inscribed, "*Effigies Lucæ Leidentis propria manu incisa*," of quarto size. Portrait of a young man, half length, dressed in a cap and feathers, and pointing to a skull which he holds under his robe. This portrait commonly passes for that of Lucas himself, but it is very unlike the former. Lucas is always represented with short plaited hair, and this portrait has very long and curly hair; it is of quarto size, and engraved apparently about the year 1525. There is a print attributed to Lucas, of which the subject is "*A Family surprised by Death*," but it is too poorly executed to be really his performance; for in the year 1529, the period when this print was engraven, our artist was in his meridian. The drawing of it is the best part, but there is great want of spirit and correctness in the contours.

Martin Van Veen was born at the village of Hemskirk, in Holland, in the year 1498, and till he was eclipsed in the public notice, by the celebrated painter of that name, was called after his native village. He learned the rudiments of drawing from John Lucas, and of painting from John Schoreel, but of the subsequent progress of his studies, there are two accounts of an opposite nature. Strutt says, that "his early application was attended with little success, and his genius was clouded by an appearance of natural dulness, which seemed to preclude all hope of his ever attaining to any reasonable degree of perfection." Huber, on the contrary, after seeing Strutt's biography of this artist, says, that he imitated the style of his master Schoreel so well, that he became jealous of the rising talents of Van Veen, and expelled him from his school; from which it is clear, that if the scholar was not a blockhead, the master was illiberal.

Van Veen, however, has obtained praise from Mariette, and from Girard Lairesse, and the ease and accuracy of his drawing, and firmness of his contours, have been repeatedly commended. After quitting the school of Schoreel, the fame of Michael Angelo, and the antique sculpture, attracted him to Italy, but after studying there for some time, he returned to Holland and settled at Harlem, where he died in the year 1574.

Neither the engravings nor paintings of Van Veen would now be much admired, being deficient in grace, expression, and harmony of chiaroscuro, but among his contemporaries his works commanded respectful attention. They may be known by the monogram which the reader will find in *Plate I.* of those used by the engravers of the Low Countries.

Among his best prints are "*Judah and Tamar*," and "*The Annunciation*," both in 4to.; "*Commercial Industry*," in folio, and "*The Wife and Foolish Virgins*," nearly of the same dimensions. The twelve plates of the battles of Charles V., which have been attributed to him,

are from the graver of Theodore Coornhaert, but were executed after his designs.

Dietrich, or Theodore Vander Staren, or Von Stern, was born in Holland, some time about the year 1500; the time of his death has not been recorded, but it is known that he continued to engrave till 1550. He is ranked by the French in the class of little mailers, and known by the appellation of the Master of the Star, because in his monogram he used to place a star between his initials, as seen in our first plate of those used by the engravers of the Low Countries. His compositions prove him to have been a man of talent: he has engraven many landscapes and subjects from sacred history, after his own designs. He understood the human figure tolerably well, but his proportions, like those of the Dutch people, are short and heavy; and he often crowded his back-grounds with architectural ornaments. To his monogram he usually added the day of the month on which his plates were published.

The following are engraved by Vander Staren from his own designs. "*The Miraculous Draught of Fishes*," dated 1523, in octavo; "*Christ walking on the Sea*," a small upright; "*The Temptation of Christ*," where the Devil is represented with pointed shoes; a small upright plate. A very small plate of a faint kneeling before the Virgin, who holds the infant Christ, dated 1524; "*St. Luke painting the Virgin and Child*," dated 1526, of octavo size. A folio plate of "*The Deluge*;" marked D. Van Stern. fec. 1523; and "*The Good Samaritan*," engraved A D. 1525, in octavo.

Of Francis Babylone, better known by the appellation of the Master of the Caduceus, we have various accounts, and all of them involved in more or less of uncertainty. He was probably born some time about the commencement of the sixteenth century, and, according to Rost and Huber, at Leyden: he is supposed to have studied in Italy under Marc Antonio, or Gregory Peins. The time of his decease is entirely unknown.

As he neither affixed name, date, nor initials to his very singular prints, but simply the small caduceus which will be found in our first plate of the monograms, &c. used by the engravers of the Low Countries, his very name is scarcely settled, and he has been by some writers called Israel Martin, and affirmed to have been the tutor of Albert Durer, Lucas of Leyden, and Aldegrever.

The master of the caduceus was quite original in his style of engraving, but it has not been thought worthy of imitation, and his prints are now sought after by the curious merely on account of their great rarity. He worked entirely with the graver: his courtes of lines, which are rarely crossed, are rather feeble than delicate; his extremities are poorly marked, and always too large; his draperies are perplexed with small and inelegant folds, and his heads neither characteristic nor expressive.

The principal works which have been mentioned as bearing this mysterious mark, are as follows. A small upright plate representing "*Apollo and Diana*." Another of the same size, of three men bound. "*A Holy Family*," in a small square plate, half figures: the Virgin is leaning on the stump of a tree, and the head of Joseph is seen towards the right hand of the print. Another "*Holy Family*," a small plate lengthways, where the Virgin is represented seated at the foot of a tree; the child is standing by her side; Elizabeth is seated near him; an angel is playing upon a musical instrument; and Joseph appears at the right hand of the print. "*The Adoration of the Three Kings*," a small upright plate; "*St. Jerome writing*, with a Crucifix before

LOW COUNTRIES, ENGRAVERS OF THE.

before him," a small plate lengthways. Two small upright plates: one representing a man carrying a boat, and the other, a woman with a child in her arms. Jerome Hopper has copied both these figures on one plate, much larger, and decorated the head of the woman with stars and a glory. "A Sacrifice to Priapus," (which is generally attributed to M. Antonio, because it has his tablet,) is copied smaller by this artist, and the indecency which appears in the former plate is here omitted. It represents a woman standing by the altar, and another opposite to her, holding an infant; and an old woman's head appears in the background. This is the only print by this master, with which we are acquainted, that does not appear to have been engraved from his own composition; and it, more than any other circumstance, affords us in settling his chronology.

Cornelius Matfys, or Metensis, was born some time about the year 1500, and we believe in the Low Countries: though he appears to have resided much in Italy; and it is not improbable that he was the disciple of George Peins. We have a great number of engravings by him, both from his own compositions and those of the Italian painters. His style of engraving bears superior resemblance to that of Babylon in neatness and delicacy of execution, but his figures are much more in the Italian taste, and are not destitute of elegance and proportion. Strutt has supposed there were two artists of these names, but the foreign writers mention only one. His monogram will be found in our first plate of those used by the engravers of the Low Countries.

We shall mention the following prints by this artist. "Ernest, count of Mansfeld," a print of quarto size; "Cleopatra with the Asp," a small print, dated 1550. An old man and two old women, one of whom holds a basket of eggs, a small print, dated 1549. "Judith with the Head of Holofernes," dated 1539. A battle, a small upright plate, from G. Peins. "A Holy Family," where the Virgin is represented holding the infant on a cradle, caressing the little St. John, from Raphael, of folio size. (This is from the same picture that was afterward engraven by F. de Poilly in France.) "The Miraculous Draught of Fishes," from Raphael. The Plague, a subject known in Italy under the name of "Il Morbetto," engraved by M. Antonio, and regravé by Cornelius Met, with his monogram, and the name of Raphael, folio size. "Christ laid in the Sepulchre," from an etching by Parmegiano, of quarto size.

Of Jerome Bosch, or Bos, an ancient painter and engraver of grotesque subjects, we have already treated, (see the article Bos,) but, by mistake, have placed his death in the year 1500, copying the error of Strutt. According to the best foreign authorities he was not born till 1498; the final period of his life they have not recorded. His Gothic manner of subscribing his works will be found in our *Plate I.* of the monograms, &c. used by the engravers of the Low Countries.

Besides those of his works which we have already mentioned, he engraved "The Temptation of St. Anthony," on wood, which being dated in the year 1522, corroborates the chronology which we now offer. "The Miraculous Vision of the Emperor Constantine," in quarto; "Jesus baptized by John," a folio print, with the name of Bos. A folio print representing a number of grotesque figures, inscribed, "Al dat op," &c. &c. Bosch. Another folio print of the same kind, inscribed, "Dese Jeremias Bosch drollen." An allegorical print, of an elephant, inscribed, "H. Bos inv." Paul de la Louwe, exc. in folio.

Cornelius Bus, or Bosc, or Vaaden Bosch, was born at Bois-le-Duc, in Flanders, some time about the year 1510.

In his youth he went into Italy, and established himself at Rome, where, exclusive of his profession as an engraver, he carried on a considerable commerce in prints. A subject engraved by him, of females at different domestic employments, with a German inscription, beginning thus, "Alm die ein from bidert Weib überkومت, &c." has made M. de Heinneken think that Cornelius was a German, and that in Italy he changed his name to Bus; but the general opinion is, that he was born where we have stated above, and that his true name was Bosch.

His style of engraving sometimes resembles that of Marc de Ravenna; at other times that of Eneas Vico. He never arrived at any superior degree of excellence. He worked entirely with the graver, in a stiff, dry, style, without taste. His drawing is by no means correct; neither are the heads and other extremities of his figures sufficiently attended to; and from the lights being diffused, and the feebleness of the masses of shadow, his engravings are usually destitute of effect. He has engraved after his own compositions and those of other masters; and he commonly marked his prints with one or other of the monograms which will be found attached to his name in our first plate of those used by the engravers of the Low Countries.

The following prints may be reckoned among his best. "The Last Judgment," marked with his cypher, and dated 1550, of quarto size; "Lot and his Daughters," with his monogram, dated 1550, of folio size; "King David giving the fatal Letter to Uriah," dated 1546; "Our Saviour preaching to the Jews," in folio; "Venus on her Car," in quarto, dated 1546; "Vulcan in his Forge," in folio, 1546, all marked with his cypher; "Combat of the Centaurs and Lapithæ," on two large plates, dated 1550; "A Monk seized by Death," in quarto, marked with the monogram. An equestrian statue of Marcus Aurelius, in folio, with the monogram. A set of sixteen plates of grotesque arms and trophies, engraved at Rome in the years 1550 and 1553. Another set of caryatides and thermes. "Moses receiving the Tablets of the Law," from Raphael, in folio, 1551; "Triumph of Bacchus," a large print, lengthways, engraved on three plates from Julio Romano, dated 1543; "The Entombing of Christ," a folio plate, dated 1554, from Francisco Floris, marked "Corne in Bus fecit"; "Moses breaking the Tablets of the Law," folio, from Raphael, dated 1550.

Having already treated of the family of Breughel, which flourished as painters and engravers at the period now under our notice (see the article BREUGHEL), it remains only to add in this place, that Peter Breughel the younger, surnamed, or rather *nick*-named "the Hellish," was the principal engraver of that family, and the chief of his engravings (which are somewhat numerous, and rendered very entertaining by his peculiarities) are as follow. They are generally marked with a monogram, which will be found in our first plate of those used by the engravers of the Low Countries.

A large folio plate of a village fête: a banner is displayed over the door of a cabaret, and the numerous figures introduced, some are dancing, others reclining, and others quarrelling. Another folio print of "Peasants rejoicing"; "The Feast of the Archers," in which the banner of their company is displayed before an arbour, inscribed "Dit is de Gulde." A very rare wood engraving of a masquerade, known by the name of "Valentine and Orson"; "Mercury and Psyche," the landscape part of which is a view on the Rhine; "Delalus and Icarus," companion to the above, being another view on the Rhine: both are in-

scribed "Petrus Breughel fecit Romæ 1553;" and all the above are of folio size.

Early proofs of the works of Hieronymus, or Jerome Cock, are much sought after by the curious, but it is on account of their scarcity and not their merit, for his style is laborious, poor, and scratchy. The praise which Vasari has lavished on him, is therefore not merited. His biography we have already sufficiently detailed, (see the article Cock), except that we have there omitted to mention that he was born at Antwerp in the year 1510. His monogram, similar to that of Hans Collaert, will be found in our first plate of those used by the engravers of the Low Countries. From his numerous engravings, we select the following as those which are held in most esteem, beginning with his

Portraits.—A pair of the oval form, in 4to. of Francis II. king of France and Scotland, and Mary queen of Scotland and France. Another pair of Gustavus and Maria, king and queen of Sweden. Another of Soliman, emperor of the Turks, and Camilia his daughter, all in ovals, and of folio dimensions. A large folio plate, containing the heads of Guido, Cavalcantes, Dante, Boccacio, Petrarch, Politian, and Ficinus. And, conjointly with Wierix, a set of twenty-four of celebrated artists of Germany, in folio, dated 1572.

Processions, Views, &c.—A set of fifty-nine, entitled "Præcipua aliquot Romanæ antiquitatis monumenta Antwerpæ M. D. L. I." Another set of twenty, entitled "Operum antiquorum Romanorum hinc inde per diversas Europæ regiones." "The Funeral Procession of the Emperor Charles V." engraved on several plates, and forming, when pasted together, a long frieze. A set of twelve plates, entitled "Divi Caroli V. ex multis præcipuæ victoriarum imagines 1556." A set of fifteen, entitled "Compartimentorum quod vocant multiplex genus lepidissimis historiis poetarumque tabellis ornatum, 1566. Gedruckt by Hieronymus Cock in de vier Winden."

Historical, &c.—"Moses with the Tablets of the Law;" "St. Christopher crossing the Water with the Infant Christ," a subject from the life of Sylla, inscribed "Quidquid est hujusmodi etc.;" "A Sacrifice to Priapus," where the sacrificers are represented slaughtering an ass, 1557; "Femina sub Jove sunt;" Tarquin and Lucretia, "Tarquinius, &c." An emblem of Vanity, inscribed "Hodie mihi, cras tibi;" it represents the dead body of a young man lying on a table near a skull: at the bottom of the print is written "Vigilate quia etc." Cock excud.; all in folio.

Various Subjects from the Painters of the Low Countries.—A set of fifteen historical landscapes, painted by Mathew Cock, and engraved by Jerom, of which the subjects are; 1. Abraham sacrificing Isaac. 2. Judah and Tamar. 3. The Prophet Jonas weeping over Nineveh. 4. The Departure of Tobias with the Angel. 5. The Flight into Egypt. 6. The Baptism of our Saviour. 7. Jesus tempted in the Desert. 8. The good Samaritan. 9. Mercury and Argus. 10. Mercury killing Argus. 11. Venus mourning for the Loss of Adonis. 12. Cephalus and Procris, 1558. 13. The wondrous Labyrinth. 14. The Loves of Hero and Leander. 15. Daphne metamorphosed into a Laurel. A large landscape, representing the festival of St. George, with the banner of the saint, from Mathew Cock; "Samson and Dalilah," with the temple of the Philistines in the back-ground, in large folio, from Hemskereck; "Daniel in the Lion's Den," in the back-ground are the Babylonians lamenting the overthrow of the dragon and Bel, and the prophet Habakkuk is conducted through the air by an angel, from the same master, in large folio. A set of eight, representing the illustrious women of the Old and

New Testaments, viz. Jael, Ruth, Abigail, Judith, Esther, and Susannah, from the old, and the Virgin Mary and the Magdalen from the new, in folio. An allegorical subject, representing "Fraud and Avarice;" a bacchanalian subject of "Children dancing," both of folio size, all from Hemskereck; "The Resurrection of our Saviour," from Breughel the elder, in large folio; "The Temptation of St. James and St. Anthony," 1565, both in folio; and from the same master, "The Last Judgment," with the cypher of Cock, dated 1558, in large folio; "The Laboratory of an Alchymist," in folio; "The Carnival, or Dispute between the Fat and the Lean," in two folio plates, dated 1563. A set of twelve historical landscapes, most of them sacred subjects, with Latin inscriptions, of large folio size, etched by Jerom Cock, all of them from the elder Breughel. A grotesque composition of "The large Fish devouring the smaller," from Jerom Bos; it is inscribed "Vrinden dit heestmen reel Jaren geweten Dat de groote Vissen de cley-nen eeten," in large folio. A large folio print of "The Temptation of St. Anthony," inscribed "Multæ tribulationes." "St. Martin in a Boat with Devils," in large folio; "A Dream," 1561; "Shrove Tuesday," an allegorical subject, of large folio size, 1567; "De Blau Schuyte," "The Blue Ship," in large folio, all from Jerom Bos; "The Combat of the Horatii and Curiatii," after Francis Floris; "Hercules sleeping, assailed by Pigmies," from the same master, both in large folio; "King Ahasuerus, surrounded by his Court, investing Esther with Royalty," from Lambert Lombard; "Jesus with his Disciples, at the House of Martha and Mary," 1556, in large folio; "Jesus at Table in the House of Simon the Pharisee," 1551, in folio; "The Resurrection of Lazarus," both from the same master, in large folio, all inscribed H. Cock, exc.

Subjects from Italian Masters.—"Abraham offering up Isaac," and the angel appearing with a ram, from Raphael, 1552, in folio; "The Nativity," from the same painter, in folio; "Many are called, but few are chosen," in large folio, from Andrea del Sarto, dated 1553; "Females bathing," a folio print, from Lucas Penni; "Captives respicing," a frieze from Polidore; "The Passage through the Red Sea," from Angelo Bronzino, in folio; "The Visitation of Elizabeth," from Sebastian del Piombo, in folio.

Jacob Bosius, or Bossius, surnamed in Italy *the Belgian*, was born in the early part of the sixteenth century, but in what part of the Low Countries we are unable to say. He studied in Italy under some one of the disciples of Marc Antonio, but never rose above mediocrity. His style is neat, but wants both freedom and correctness of outline. The extremities of his figures especially are heavy and not well marked.

He often marked his engravings with two B's, which shews that he adopted the surname of *Belgia*, which was conferred on him by the caprice of the Italians. The time of his death has not been mentioned.

Of his works the following few appear to include all the variety which Bossius was capable of exerting, and more than he could exert with credit as an artist.

The portrait of Michael Angelo, in octavo. Busts of St. Thomas Aquinas, and Otho Truchsess, bishop of Albany, in quarto. "The Crucifixion," in folio. A set of the four Evangelists, after Blockland, in quarto. "Jacob's mysterious Dream," and "St. Peter and St. John healing the Cripple" both in folio, and after Raphael. The statue of Pyrrhus, king of the Molosses, from the antique, in folio, dated

LOW COUNTRIES, ENGRAVERS OF THE.

dated 1562; and "The Baths of Dioclesian," with other views of antiquities executed in conjunction with Ant. Lafreri.

Lambert Suterman, or Suavius, was born at Liege, in Flanders, in the year 1510, and became the disciple of Lambert Lombard, with whom Sandrart confounds him; but Heinneken has removed all doubt on the subject, proving that Lombard was merely a painter and never used the graver at all.

Suavius engraved many plates both from his own designs and those of his master. His figures are generally tall and thin; the outlines of the naked parts of them are tolerably correct, but dry and without dignity. His draperies are generally divided into small folds, which by not being sufficiently varied or contrasted with each other, form unpleasing lines. The attitudes of his figures are seldom well chosen, or properly adapted to the subject, and the management of the light and shade by no means commendable. His style of engraving is very neat, and seems to have been contracted in the German schools; but his mode of design discovers more of the Italian than the German taste.

His engravings are numerous, but neither exquisite nor very rare; we shall mention the few following

From Lambert Lombard.—"Charity," surrounded by eight children; "The Resurrection of Lazarus," both in quarto, dated 1544; "Jesus travelling to Emmaus, with his two Disciples," in folio; "The Entombing of Christ," in quarto; "St. Peter and St. Paul healing the Sick;" "The Descent from the Cross," and "Our Saviour restoring the Widow's Son," all in folio; "Psyche with the Vase of Proserpine and Juno," marked with the name of Raphael, in small folio.

From his own Drawings.—"The twelve Apostles," in quarto. Two circular prints, representing a profile of our Saviour, and one of the Virgin Mary. A bust of Melchior Schets, in a circle, inscribed "Mundus regitur opinionibus," 1561; Anna Stralen, "Mel Schetsi conjux," 1554; "Michael Angelo Buonarotus, nobilis Florentinus," a circular print; and a portrait of Cardinal Granvelle, in quarto. All the portraits by Suavius are executed in a very delicate style.

The family of Goltzius were illustrious in art. Hubert, the first of that name who distinguished himself as an engraver, was the son of a painter of Wurtzburg, but was born at Venloo in the year 1520. Under the tuition of his father and of Lambert Lombard, he acquired some proficiency both in arts and in letters, and, having to copy some drawings which had been done from the antique, at the house of the latter, they excited in him so strong a desire to see and study from the originals, that he forthwith set out for Rome. After remaining some time in that distinguished metropolis, he travelled homeward through Italy, France, and Germany, leaving few of the celebrated works of art, or European monuments of antiquity, unseen; and finally established himself at Bruges, where he successfully published those volumes of medals, inscriptions, and other objects of antiquarian research, collected during his travels, which are still sought after by the curious; and where he died in the year 1583.

Strutt says, "he was twice married, and the abominable crossness and ill temper of his second wife (ill suited as a companion to a studious man) is said to have shortened his days." Most of his antiquarian writings are composed in the Latin language, and were printed, as well as their engraved accompaniments, in his own house.

Hubert painted some few pictures which have been spoken of with commendation, and are valued for their rarity, but is chiefly known as a man of letters and an engraver. He ob-

tained the title of painter and historian to Philip II. of Spain, to whom he dedicated, "Falti Romani ex antiquis numismatibus et marmoribus are expressi et illustrati;" and "Icones Imperatorum Romanorum, et series Austriacorum, &c." both in folio, and printed at Bruges.

The medals in these works are executed in *clair obscure*; and it has since been copied and reprinted at Antwerp by Balthazar Moret, who has added five medallions from designs by Rubens, in order to bring down the series to the time of Ferdinand III.

The manner in which Goltzius produced his prints in *clair obscure*, was by first printing from an outline etched on copper, and afterward impressing the half tint and deeper shadows from the surfaces of blocks of wood and with the letter-press. In this manner our artist produced two other works, adorned with numerous engravings by himself and Joseph Gietleughen of Courtrai, of which the first, printed at Bruges in 1563, and containing forty-six prints, is entitled "C. Julius Cæsar five historiarum Imperatorum Cæsarum Romanorum ex antiquis numismatibus relicturæ, liber primus, Huberto Goltzio Herbipolita Vanloniano Auctore et Sculptore;" and the second, containing two hundred and thirty-four engravings, printed at Bruges in 1566, bears the title of "Falti Magistrorum et Triumphorum Romanorum ab urbe condita ad Augusti obitum ex antiquis Monumentis relictos, Hubertus Goltzius Herbipolita Venloianus dedicavit."

Henry Goltzius was a man of more genius, though of less research, than Hubert. His father, John Goltzius, was a painter on glass, of Mulbrech, in the neighbourhood of Venloo, where our artist was born in the year 1558.

After acquiring some knowledge in the rudimental part of drawing under his paternal roof, Henry was placed, first under Jaques Leonherd, and afterward became the disciple of Theodore Coornhaert, who taught him engraving, and under whose tuition he soon began to discover very surprising talents in that novel and difficult art, notwithstanding the disadvantage of a lame hand, which was occasioned by falling into the fire during his infancy.

Goltzius afterwards worked, for a short time, for Philip Galle, but in consequence of domestic troubles and an ill state of health, occasioned partly by his too close professional application, was advised to travel. His desire of improvement coinciding with his medical advisers, he passed through Germany into Italy, visiting Bologna, Florence, Naples, Venice, and Rome, frequently assuming a feigned name, that he might with the less interruption apply himself to the study of the antique and the *grand gusto* of Michael Angelo.

Now was the time when what the professor Fuseli terms the "frantic pilgrimage" of artists to Italy, raged with crusading zeal, and no painter in the estimation of the hypercritics, might be considered as perfect in his art, who had not trembled before the Last Judgment of the terrible Michael Angelo; moderation in style, was insensibility; and Goltzius himself, though a man of discernment, became infected to a certain degree with the fashionable bombast.

In the genial climate of Italy his health returned, and at Rome he remained for some years, producing there several very excellent engravings from Raphael, Polidoro, and other eminent masters. He finally returned to the Low Countries, and established himself at Haerlem, where he engraved many plates, of which the subjects consist partly of his own compositions, and are partly taken from the drawings which he copied from celebrated works of art during his residence in Italy, where, in 1617, he died at the age of fifty-nine years.

He married a widow lady of Haerlem, whose son James Maetham (the fruit of a former marriage) became (as we

shall

shall have occasion to notice) a distinguished engraver, under the instruction of his father-in-law. He is said to have been forty years of age before he began to print. His pictures are few in number, and their rarity perhaps has raised them to a higher value than they might else have attained.

But we have to speak of him chiefly as an engraver. Possessing considerable anatomical knowledge, he drew the human figures admirably, and articulated the joints and extremities with superior skill. But conceiving himself qualified, on his return from Italy, to correct the littleness and Gothic stiffness of his Dutch and German contemporaries in art, and the taste which prevailed among the connoisseurs of the Low Countries, he too frequently ran into the opposite extreme, and twisted and bent his fingers and his feet, sometimes into absolute distortion, in spite of nature and his own superior knowledge. While the mania lasted, his intended grace became real affectation, and his grandeur ridiculous swagging.

In order to shew that the revolution in style which he aimed at accomplishing, was the result of superior powers, and that it proceeded not from his inability to emulate and excel, at their own weapons, the heroes of Holland and Germany, he took a most effectual method, in the prosecution of which he was eminently successful. He composed and engraved what are termed his *chef-d'œuvres*, or *masterpieces*, which shew the amazing versatility of his talents; and which, though chiefly aimed at the reputations of Albert Durer and Lucas of Leyden, does not scruple to provoke comparison also, with Bassan, with Parmegiano, and even with Raphael himself.

There had not been wanting among the connoisseurs and amateurs of the Low Countries, some who insinuated that Goltzius deviated from the styles of art which had called forth their admiration, because he had fancied or found them to be inimitable. No expedient could more justly or more completely have silenced these observations, than the contrivance and execution of these six large engravings. Before he made public that of which the subject is "The Circumcision," and which was designed to vie with Albert Durer; and before his general purpose was known, he bellowed a few years of age on an impression, by means of smoke, and exhibited it in the presence of a chosen few, who, to the great entertainment and secret satisfaction of our artist, stood in spectacles and in raptures, before the supposed engraving of Albert Durer. And, in truth, this print so very much resembles the very best works of that master, both in design and execution, as to be scarcely any impeachment of the discernment of the connoisseurs who were thus deceived.

Goltzius might now fearlessly publish his masterpieces, which he did with extraordinary success, and in which, after varying his style five times in order to imitate severally the masters above-mentioned, he finishes the set of six with an "Holy Family," which he meant should be understood as the improved style of Henry Goltzius, and which closes the procession, and completes his triumph,—but not the catalogue of his merits.

He engraved portraits from his own drawings, in a very masterly manner, very tastefully uniting excellent drawing, and vigorous effect of light and shade, with neatness of execution. He also engraved from his own compositions on wood, in the manner which is technically termed *claire obscure*, or *chiaroscuro*, in which he differed from Hubert Goltzius, by employing *three* blocks of wood; on the first of which he cut his outline with great boldness and spirit; the second served to impress the demi-tints, the high lights being cut away; and the third the deeper shadows. In the works which he executed in this way, the lights appear as if em-

bossed, and they are on the whole very masterly productions.

The power of Goltzius over his graver, which was the chief instrument of his art, and the freedom, boldness, and copious variety of combination with which he hatched his courses of lines, is wonderful, and would have been truly fascinating, had he adhered to that pure and accurate style of drawing which once distinguished him, instead of deviating into extravagance and eccentricity.

The cypher with which he marked his engravings, when he did not subscribe his name at length, may be seen in our first plate of those used by the engravers of the Low Countries.

We begin our catalogue of his works, which will probably long continue to rank in the very first class of the arts of his country, with his

Portraits.—A bust of Gertraud Adriaansz Brederods, in an oval, with an allegoric accompaniment of two tigers and a laurel, a very rare print; Henry III. king of France, an oval, very rare, dated 1592; Frederic II. king of Denmark, quarto size; William prince of Orange, in an oval, surrounded with a grotesque border, in folio; Charlotte of Bourbon, princess of Orange, companion to the preceding; both engraved in a very delicate style; Theodorus Coornhertius ad vivum depictus et acri incisus, ab H. Goltzius, a very rare folio print; Hans Bol, after Joannes Boltius, a folio print, surrounded with ornaments; John Stradan, a painter of Bruges, in quarto; Philip Galle, an engraver of Antwerp, of the same size, dated 1582; Peter Forest, or Forestus, a Dutch physician, in octavo, dated 1586; Julie-Lipse, a celebrated critic, inscribed "Moribus antiquis," dated 1587; a half-length portrait of John Zurenus, painted by M. Hemskerk, in quarto; Monsieur de la Faille, inscribed "Leges tueri. Harm. Adolfs. exc." in quarto; Madame de la Faille, companion to the above, (a young woman with a skull in her hand.) This pair of portraits are executed with extreme delicacy, and are much celebrated. Christopher Plantin, a famous printer; and Francis d'Egmont, completely armed, a half-length portrait, both in quarto; Robert, earl of Leicester, general in the United Provinces, 1586, a very fine print, in a small oval; S. Sovius, inscribed, "Bene agere et nil timere," 1583, rare; a half-length portrait of a man measuring a globe, inscribed "L'homme propose, et Dieu dispose," 1595. This is believed to be the portrait of Petri, an astronomer of Amsterdam, in 12mo. A lady sitting in a garden chair, supposed to be the portrait of Catherine Dekker, of Haerlem, of the same size; bust of a man with a round hat, in 4to.; bust of a female with a hat, executed entirely with the graver; half-length portrait of a female, veiled, and covered with drapery, 1606, tastefully engraven in a neat and elaborate style; and the bust of a man, with a cocked hat, both of quarto size.

Various Subjects from his own Compositions.—A circular print in quarto, of "Judah and Tamar," one of the earliest engravings of Goltzius. A set of six capital prints, which we have particularly noticed in his biography, and which are known by the name of the *masterpieces* of Goltzius. 1. The Annunciation, in the style of Raphael. 2. The Visitation, in the style of Parmegiano. 3. The Annunciation, in the style of Bassan. 4. The Circumcision, in the style of Albert Durer. 5. The Adoration of the Kings, in the style of L. of Leyden. And 6. A Holy Family, in his own style, or, according to some critics, in the style of Barrocio, all of large folio size: it should be known, that in the Circumcision he has introduced his own portrait. A very rare print of "The Nativity," in large folio, which is unfinished; inscribed Jac. Matham, exc. 1615. "The Ado-

ration of the Kings," in quarto. rare; "The Slaughter of the Innocents," C. Visscher excud. likewise very rare; and in an unfinished state, a very large folio. "A Repose," H. Goltzius fecit. in 4to. 1589; "The Good Samaritan," H. Goltzius sc. et excud. 1589; The Passion of our Saviour, in twelve plates, H. Goltz. fec. 1597, in 4to. These are engraven somewhat in the style of Lucas of Leyden. The half-length figures of Christ, and thirteen apostles, with Latin inscriptions, engraved on fourteen plates, H. Goltzius fec. in octavo, 1598. Another set from the same originals, said by Huber and Rost to be almost as large as life, and the name of each apostle added; executed with very bold courses of lines. "The Adoration of the Kings," a singular composition, and a very rare folio print; "The Infant Christ," seated on a cushion holding a globe, and surrounded with a glory of angels, a very finely engraved plate, in 4to. dated 1597; "The Temptation of St. Antony," and "A Saint, holding a Book," (perhaps Jerome,) both in quarto. A set of fifty-two, from the Metamorphoses of Ovid: it is believed that Goltzius was assisted by his pupils in the execution of this set. A set of ten of the heroes of ancient Rome, viz. 1. The Horatii and Curiatii. 2. Horatius Cocles. 3. Mutius Scævola. 4. Curtius. 5. Torquatus. 6. Corvinus. 7. Manlius. 8. Calpurnius. 9 and 10 are allegorical subjects. This set is executed with very bold strokes, and have very fine back-grounds. A circular print of Venus resting against a tree, and Cupid presenting a sword, inscribed "Sine Cerere et Baccho, friget Venus," executed in so very delicate a manner, that it forms a striking contrast with the former. A set of three ovals, representing 1. Bacchus; 2. Venus; and 3. Ceres, dedicated to Cornelius of Haerlem. Another set of three ovals, of 1. Pallas; 2. Juno; and 3. Venus, dated 1596. A couchant Venus, surrounded by the four elements, personified by cupids, an oval print, all of folio size. "Mars and Venus, exposed to the Ridicule of the Gods," 1585, in large folio. Three folio plates of the loves of the gods; 1. Jupiter and Juno. 2. Neptune and Amphitrite. 3. Pluto and Proserpine. "Apollo in the Clouds," with an inscription round his head, 1588; "Pygmalion and the Statue," 1593, all in folio. A small oval print of "Mercury and Argus," very rare; the nine muses, dedicated to John Sadeler, dated 1592, in folio; three folio circular prints of "The Destinies;" "The three Graces," crowned with laurel, in folio; a large folio print of "Apollo Pythius, Statua antiqua Romæ, in palatio Pontificis Belvedere, etc." "Hercules ΑΛΕΞΙΚΑΚΟΣ Inscrip-tus Roman. Commodus Imperator. Statua antiqua Romæ, in palatio Pontificis Belvedere, etc." in large folio, with four Latin verses; and "Hercules Victor. Statua antiqua Romæ, in palatio Cardinalis Farnesii, etc." published after the death of Goltzius by Herman Adoif, in large folio. These three statues form a very beautiful and interesting set, where the vigorous powers which distinguish the graver of Goltzius, are exhibited in high perfection. "Hercules;" in the back-ground are represented some of his labours; of very large folio size, dated 1589. In this print the artist appears to have intended to convey an idea of god-like strength, but has run far into the extravagance which we have censured in his biography. "Apollo playing on his Lyre, surrounded by the Muses," a very large print, dated 1590. The seven cardinal virtues; Faith, Hope, Charity, Justice, Prudence, Fortitude, and Temperance; of quarto size; seated on ornamental architecture. Three very fine prints, in folio. Eight females embracing, representing human virtues in four very fine folio prints; "Labour and Diligence, (personified by a man and female,) embracing," a very rare quarto print, dated 1582. A naked infant resting

against a skull; an emblem of human vanity, in large quarto. "Christian Prudence," represented by a draped female, inscribed "Ardere serpentes, et simplicitate columbas," a very rare engraving, in a small circle; "The Blind leading the Blind," a small circle, very rare; "The War Chariot," with an explanation in French and Dutch, of large folio size. A young female, refusing the offer of a rich old man, followed by a young one. A companion, of a young man refusing an old woman, both rare prints, and of folio dimensions. "The Dog of Goltzius," or "The Boy and Dog;" it is pretended by some that the boy who is introduced is the son of the Venetian painter Theodore Frisius, to whom the print is dedicated; and by others that it is the portrait of the engraver himself: it is in large folio, an exquisite print, and the good impressions are now become rare and valuable. "Coridon au Silvia," a pastoral subject beautifully engraven. A man in a Spanish dress, carrying two flowers, in folio, inscribed "Sic transit gloria mundi." An officer with a halbert, with a battle in the back-ground, in fol. An officer marching, and a view of the city of Prague in the back-ground, 1587. A grand mountainous landscape with shepherds tending their flocks in the fore-ground; and in which Dedalus and Icarus are seen in the air; a large folio print, and one of the finest etchings by Goltzius.

Engravings on Wood, in Clair-obscur, and Cameo.—A landscape, with rustic buildings, and a female drawing water from a well, in 4to. A landscape, with an enormous rock on the shore of a raging ocean, and an hermit prostrate, in 4to. A rustic subject with sheep feeding, in 4to. Half-length portrait of a warrior, with lance and helmet, in folio. "Hercules combating with the Giant Cacus," engraved on a single block, in folio. The same subject executed in clair-obscur. A set of seven figures of heathen divinities, viz. Jupiter, Neptune, Pluto, Thetis, Flora, Night, and Eternity; these prints are in ovals of large folio size, and have a very striking effect.

Subjects from Italian Masters.—"St. Joachim," from a picture by Raphael in the church of St. Augustin at Rome, dated 1592, in folio; "The Triumph of Galatea," from a picture by Raphael, in the Farnesian gallery. Eight divinities in niches, from Polidoro; viz. Saturn, Neptune, Pluto, Vulcan, Apollo, Jupiter, Bacchus, Mercury, in folio. Two sybils, after antique statues, in 4to. "The Last Supper," from a very grand composition by Paul Veronese, dated 1585; "The Marriage of Cana," after J. Salviati, a very large engraving, executed on two plates; "St. Jerom meditating in a Desert," from Palma the younger, in large folio.

Subjects from various Masters in the Low Countries.—"The Fall of our first Parents," in 4to. from Barth. Spranger, 1585; "A Dead Christ," supported by an angel, from the same master, in large folio; "The Celebration of the Nuptials of Cupid and Psyche among the Gods," from the same master, executed on two large plates; "The Dragon devouring the Companions of Cadmus," after Corneille Cornelius, in folio, 1588; "Ulysses reproving Irus before the Suitors of Penelope," from the same master, in large folio. Large circular prints of the four elements, represented by Tantalus, Icarus, Ixion, and Phaeton; "St. Paul shaking off the Viper, in the Isle of Melita," from J. Stradan, in folio; "Lot and his Family forsaking the burning City," from Ant. Blocklant, dated 1582, in large folio; and "The four Evangelists at the Sepulchre of Christ," from the same master, 1583, of large folio dimensions.

Julius Goltzius was probably of the same family with Henry, but the acquisitions of genius are unalienable, and Julius attained to no eminence as an engraver. He was apparently

parently educated in the school of the Galles, but of his birth or death there is no record, though his principal work was executed in 1581. He engraved on copper, but his objects are ill drawn and tastelessly executed. Great part of the figures in "Habitus Variorum Orbis Gentium," published by Boissard, is from his hand, as are also "The good and bad Shepherd," from Martin de Vos, and "Christ appearing to Mary Magdalen," after Fred. Suckar.

Henry Van Cleef, or Cleef, also called *Clivenfis*, was born at Antwerp in the year 1520, and died in the same city in 1580. He was the brother of Martin van Cleef, whom Vasari confounds with Martin Schoen. He studied in Italy, and beside his proficiency in engraving, became an excellent landscape painter, possessing great freedom of touch, and producing an harmonious chiaroscuro. Upon his return to his native city in 1555, he was elected a member of the Antwerp academy of painters: he likewise engraved a great number of plates, which he sometimes marked with the monogram, which will be found in our first plate of those used by the engravers of the Low Countries; and at others, with "Henricus Clivenfis fecit."

Among his works the following will probably be found most worthy of selection. A bull fight, exhibited at Rome, before the Farnese palace, in folio. Two landscapes and figures, in folio. A set of six landscapes, intitled, 1. Veneris Templum. 2. Forum Æmilii. 3. Templum Fortunæ. 4. Caroli. 5. Cataractes Tiburti. 6. Corfu Insula. H. van Cleef fecit. Ph. Galle exc. in folio. Another set of landscapes: 1. View of a bridge at Segovia. 2. A promontory at Campania. 3. The tomb of the Horatii. 4. A view on the lake of Aricia, in folio. There is also a collection of thirty-five views by this artist, published under the title of "Henri a Cleve ruinarum rurumque aliquot delineationes execute, per Galleum," in folio.

Of his brother Martin van Cleef we know very little, and of his engravings nothing, excepting that professor Christ says, they were marked with a monkey seated, with the letters V. C. upon its body, in the manner represented in our Plate I. of the monograms, &c. used by the engravers of the Low Countries.

A monkey it seems, which in England is nicknamed Jacko, is called Martin in Flanders: combined with the initials of Van Cleef, it therefore formed a kind of pun; and the age in which these engravers lived, is known to have been a time when puns were fashionable, and passed for wit. Martin van Cleef, sometimes mistaken for Schoen, is the real Martin of Antwerp, of Vasari, and those Italian writers who have copied his errors.

Adrian Collaert, the elder, an artist of great merit, and likewise a printseller, was born at Antwerp A. D. 1520. He became acquainted with the rudiments of his art in his native country, but made a journey to Italy, where he resided some time in order to perfect himself in his profession. He worked entirely with the graver in a firm and neat style, but somewhat stiff. His masses of light are rarely well managed, or skilfully blended with his demi-tints, and from being too much scattered and without the necessary graduation, he rarely produced even a tolerable chiaroscuro. But to compensate these defects (which may, in part at least, be ascribed to the age in which Adrian lived), he drew with great ability. The heads of his figures are frequently beautiful and characteristic, and the other extremities well marked.

The engravings of the elder Collaert are somewhat numerous, and are generally marked with a cypher, for which see our first plate of those used by the engravers of the

Low Countries. We select from them the following, beginning with those which are done

From his own Compositions.—A man and his wife conducted by Death, dated 1562, in 12mo. An armed warrior, to whom a female presents a dog, a child, and a cock. The four elements, with a verse in Latin under each, in 8vo. A set of thirty-six prints, in 12mo., entitled "Vita Jesu Salvatoris variis iconibus, ab Adriano Collaert expressa." A set of thirty, in 4to. entitled "Avium vivæ icones in ære incisæ et editæ ab Adriano Collaert." One hundred and twenty-five subjects, entitled "Piscium vivæ icones." Another set, entitled "Florilegium ab Adriano Collaert creatum, et ab Phil. Gallo editum;" in twenty-four 4to. plates. A large folio plate from the "Last Judgment" of Stradan. "St. Anthony tormented by Devils;" and "St. Apollonius," surrounded by subjects from his life, both of folio dimensions.

From various Masters.—The twelve months of the year, from Joshua of Momper, of 4to. size: the same subjects were copied by Callot. A set of twelve beautiful horses in various attitudes, from Stradan, 8vo. plates, engraved very delicately. A set of chaces and fishing parties, from Stradan, in 4to. Four fine landscapes from H. van Cleef, entitled "Regionum rurum variis atque amoenis prospectus." A set of hermitesses, from M. de Vos, in the engraving of which, Adrian was assisted by his son, 4to. size. "The Israelitish Women singing the Psalm of Praise for the Destruction of the Egyptian Host in the Red Sea," a 4to. plate from Stradan; "Maternal Love," presumptively a satirical print, its real subject being a woman tearing her child to pieces with the fury of a lion, in 4to. from the same master; "The Vocation of St. Andrew," from Baroccio, in folio. This subject was likewise engraved by G. Sadeler. "The Mystery of the Mass," from Th. Bernard; "A Repose during the Flight into Egypt," where St. Joseph is represented gathering grapes, from H. Goltzius, dated 1585. The Annunciations of Isaac, Sampson, St. John the Baptist, and our Saviour. St. Joseph, and the Angel of the Shepherds, from the same master, 1586, all of folio dimensions. These last six plates are reckoned the best engravings of Collaert.

Hans, or John Collaert, the son of the preceding artist, was born at the same place, in the year 1540. He learned the elements of art of his father, but afterwards went to Italy for improvement. He assisted his father in most of his larger works, besides engraving a great number of plates himself; which he did in a style very much resembling that of Adrian. He must have lived to a great age, for his prints are dated from 1555 to 1622. He marked his plates with his initials, combined in a cypher, which will be found in our first plate of those used by the engravers of the Low Countries, and sometimes his name at full length. Among his works we shall specify the following, beginning with those

From his own Compositions.—Ten subjects in 4to. dated 1581, entitled "Monilium Bullarum inauriumque artificiosissimæ Icones Joannis Collaert opus extremum." The history of St. Francis, in a series of sixteen plates, with grotesque ornaments, in 4to. "A Christ," accompanied by two other half-length figures, perhaps intended for Moses and Elias, in an ornamental border; "A Dead Christ on the Lap of the Virgin," inscribed "Torcular Calcavi etc. Joan Collaert sculp.;" "The Last Judgment," surrounded with small subjects from the life of Christ, inscribed, "Hunc veniant justi, etc." all of folio dimensions; "Marcus Curtius precipitating himself into the Gulf;"

and

and "Peace and Charity," with the motto "Pacem habete;" both of folio size.

From various Masters.—"St. John the Baptist preaching in the Desert," a grand composition, in folio, inscribed G. A. Z. inventor; "Moses striking the Rock," a large print, lengthways, from Lambert Lombard. A great number of small figures are introduced into this print, and they are admirably well executed: the heads are fine, and the drawing very correct. This is considered as one of the best prints from the graver of John Collaert: it was published by Jerome Cock, 1555, and is marked "Hans Collaert fecit." "A Satyr pursued by Females," from J. Straden, in folio; "A female Centaur suckling her young;" and "A Centaur nursing a young Bear," (companion to the last;) "Mars reclining on the Lap of Venus," in 4to., both from the same painter; "The Loves of Mars and Venus," in four plates, with Latin verses, in folio. From Philip Galle of Haerlem. The following prints, for the misal of Moretus, from the designs of Rubens, are much fought after by connoisseurs: 1. The Annunciation. 2. The Nativity, with the Adoration of the Shepherds. 3. The Adoration of the Eastern Kings. 4. The Last Supper. 5. The Crucifixion. 6. The Resurrection. 7. The Ascension. 8. The Descent of the Holy Ghost. 9. The Assumption. 10. An Assemblage of the Saints in Heaven. 11. David imploring the Mercy of God on his People, afflicted with the Plague. And, 12. The Tree of Genealogy of the Jewish Kings; all in small folio. This last subject is very rare.

The following are likewise from the compositions of Rubens: "Theology," personified by a female, holding a flaming torch, on each side of whom is a Thermes, representing the old and the new laws. Frontispiece to The Ecclesiastical History from the Birth of Jesus Christ to the Year 1622, wherein Religion is introduced holding a cross and tiara. Frontispiece to The Lives of the holy Fathers, by T. Vaders.

William Collaert was the son of John, and engraved with some ability. Of his works we are only acquainted with "The Visitation of Elizabeth," in folio; and a set of ten quarto plates for "Bullarum Inaurium, &c. Archetypi Artificiosi," from the designs of his father.

Theodore or Dirick Volkart Coornhaert, or Cuerenhert, was born at Amsterdam in the year 1522, and became one of that extraordinary class of men, whom the world honours with the epithet of singular or eccentric whilst they are living, and rarely knows how to value till they are no more. In other words, Coornhaert was a studious man, of various and extensive attainments, and whose perceptions and reflections were entirely his own.

Beside cultivating the arts of design, he distinguished himself in various literary pursuits; was a good poet, and at least an original theologian. In his youth he travelled into Spain and Portugal; but the motives or result of his journey, which was perhaps connected with some diplomatic purpose, have not been ascertained.

Returning to the Low Countries, he established himself as an artist and scholar at Haerlem, of which city he became public secretary, and was several times sent as ambassador to the prince of Orange, to whom he addressed a manifesto, which has been celebrated, and which was published by that prince in the year 1566.

But unfortunately for the temporal concerns of our artist, he deemed that religion was an affair between every individual man and his Creator, in which no other man had a right to prescribe tenets of doctrine or modes of faith. He, moreover, perceiving how the priesthood degraded them-

selves by worldly pursuits, had the wisdom or the folly to maintain, that the channels of spiritual communication had become corrupt; and that without a supernatural mission, accompanied by the power of working miracles, no person had a right to administer in any religious office.

Such direct heterodoxy could not fail to draw on him violent and impassioned opposition of the clergy. Both parties became heated by disputation. The priests anathematized; and Coornhaert proceeded to pronounce that man to be unworthy the name of Christian, who would enter any place of public worship; a doctrine which he not only advanced by words, but evinced the sincerity of his belief, by abstaining from all churches, and from all ghastly communication with both Protestants and Papists.

It is needless to add, that his destruction was now complete. After being several times imprisoned, during the progress of the controversy, without abjuring his heresies, he suffered the martyrdom of banishment, and died at Dergoude at the age of 68 years, persevering in his religious opinions to the last.

Coornhaert had, early in life, acquired some knowledge in engraving, among his various pursuits, and occasionally practised that art in the way of recreation, and merely for the sake of the pleasure which he derived from it; but the pertinacity of his religious zeal having impoverished him, he was obliged to have recourse to engraving for his support. The subjects of his prints are, for the most part, taken from the sacred writings; and his style, though slight, is original, and the seeming result rather of intuitive feeling than of acquired knowledge. He worked with the graver alone, in a loose and open style, so as somewhat to resemble pen and ink drawings.

Coornhaert sometimes worked in conjunction with Philip and Theodore Galle; and it is no small addition to his reputation as an artist, that he was the instructor of Henry Goltzius, of whom we have already treated. An edition of his writings was published in three folio volumes, 40 years after his death. Whether any complete edition had preceded this, we are unable to say.

Our catalogue, which follows, of the works of this extraordinary man, is unfortunately very imperfect. We believe, however, that it includes the most favourable specimens of his talents. His plates are generally marked with one or other of the two monograms, which will be found in *Plate I.* of those used by the engravers of the Low Countries, "The Descent from the Cross," in large folio, after Lambert Lombard, dated 1556; "Joseph explaining the Dream of his Father, in the presence of his Brethren," after Hemskerck, dated 1549; the companion to which is "Joseph explaining the Dreams of the Prisoners before Pharaoh," dated 1549; both from the same master, in 4to. "Job scourged by the Devil, and scolded by his Wife;" "Balaam mal-treating his Ass;" both in large folio. "The Elector of Saxony defeated at Muhlberg by the Emperor Charles V.;" and "The Landgrave of Hesse Cassel profstrate before Charles V.;" all from M. Hemskerck, of quarto dimensions.

Mark Guerard, or Gerard, was born at Bruges A.D. 1530, and died in England 1590. He was a proficient in the various arts of engraving, architecture, and painting, both landscape and historical. He also drew and etched animals with great spirit, as is evinced in his fables of Æsop, which are from his own compositions; and in his set of eighteen quarto plates of wild and domestic quadrupeds.

He likewise delineated and engraved a plan of the city of Bruges; and a set of 14 oval prints, of the Passion of Christ.

Of Crispin Vanden Broeck, and his daughter Barbara,

who flourished about this period, we have already spoken. See these articles respectively.

Beside his celebrated *chiaroscuro* of the Circumcision, which is particularized in vol. v., Crispin engraved a set of seven folio plates of "The Creation of the World," or "The first Week," with Latin inscriptions, beginning "Ex informi coeclum;" another set from Bible history, beginning with "Eve eating of the forbidden Fruit," and ending with "The Construction of the Tower of Babel," in nine folio plates; a set of nineteen, from "The Life of the Virgin," in folio; a religious emblem, of our Saviour seated, whilst people are occupied in catching the blood that flows from his wounds, in folio; "Jesus Christ on the Cross, with the Virgin and St. John," in an ornamented border. Both the last are marked with the cypher of the artist. Four circular subjects in *clair-obscur*, likewise marked with his monogram: 1. The Annunciation. 2. The Visitation. 3. The Adoration of the Shepherds. 4. The Adoration of the Kings: all of which are very rare.

For the cyphers with which Broeck occasionally inscribed his performances, see *Plate I.* of the monograms of the engravers of the Low Countries.

In a former volume, we have treated at some length of the family of De Pisse, who, by transplanting the practice of the Low Countries, contributed to improve our indigenous stock of English engraving. The principal works of Crispin, the patriarch of that family, are as follows:

Portraits.—Andrea Doria, of Genoa, in small quarto; the elector, Frederic IV. of the same size, dated 1606; Mary, baroness of Rebourie; Adolphus, baron of Schwarzenberg; Henry Frederic, prince of Nassau; Henry IV. king of France; Mary of Medicis, queen of Henry IV. all of quarto size; Philip II. king of Spain; a bust of Alexander Farnese; Axel Oxenstiern, chancellor of Sweden, all of folio size; a circular print, in quarto, of Louisa Julia, countess of Nassau; Henry Cæsarius, juris-consult, in quarto; Nicholas Fontani, a physician, in folio; Charles Niel, a clergyman, of the same size; Maurice, prince of Orange, on horseback; Albert, archduke of Austria, and Maurice, prince of Nassau, both on horseback: in the background of the latter a camp and fortrefs are introduced; both in large folio. Queen Elizabeth sumptuously habited, in quarto, from a picture by Isaac Oliver; king James I.; Henry, prince of Wales; Charles, prince of Wales, afterwards king of England, both in ovals; Anne of Denmark; sir Philip Sidney; the earl of Essex, on horseback; Thomas Percy, a celebrated conspirator, a very rare print; all of quarto size. And fifteen plates, entitled "*Speculum illustrum seminarum.*"

Historical Subjects from his own Compositions.—"Adam and Eve," where a dog is introduced; "The Chasse Sufannah," inscribed "*Pietas et Castitas*;" and Cleopatra, inscribed "*Nec Pietas nec Castitas*," as a companion to the former, both in quarto; "Hercules and Antæus," inscribed "*Vitium ut superas terra altius atque eris*," in folio; "A Quarrel in the Interior of an Hotel," dated 1589, in folio. Three small circular busts, representing Faith, Hope, and Charity, very fine engravings. "The Four Evangelists;" half-length circular prints, in octavo. Twelve plates representing angels variously occupied, of the same size. Another set of twelve, of the Sybils, inscribed "Crispin de Pisse, inv. Crispin, Simon et Magdalen sc." in folio. "The Seven liberal Arts," and "The Nine Muses," both in 12mo. A set of seventeen, intitled "*Academia sive speculum vite scholasticæ.*"—Crispini Passaei, anno 1612—"The Riding Academy of Antonia Pleurinel," in a large folio volume, executed in the best manner of Crispin.

Subjects from various Masters.—"The Twelve Months of the Year," on small circular plates, from M. de Vos. Six plates, comprising "The History of Tobit," from the same painter; "The Four Evangelists, with their Attributes," inscribed, "Geldorpius Gorcius inventor et pinx." in large folio, very fine, and in the style of Cornelius Cort. "The Annunciation of the Shepherds," from Abraham Bloemaert; "Our Saviour on the Cross, between the Two Thieves," from Jod. de Winge, both in large folio; "The Judgment of Paris," from Crispin vanden Broeck, in folio; "The Siege of Troy," from the same master, in large folio; and a set of four mountainous landscapes, with figures, from John Breughel, of folio size.

Crispin de Pisse, junior, produced but few prints, and hence it has been supposed that he either died young, or quitted the profession of engraving.

The principal of these are the portraits of Frederic, elector palatine, and Johannes Angelus Werdenhagen, both from his own drawings, but the date of the latter, 1630, shews that he lived at least to the age of thirty years; and three plates from the History of Lazarus. A fourth plate from this history, which completes the set, was engraved by the senior de Pisse.

The works of William, the second son, who resided chiefly in London, were somewhat more abundant, but consist chiefly of portraits, among which are those of Robert Dudley, earl of Leicester; Robert Devereux, earl of Essex, on horseback; George Villiers, duke of Buckingham, also on horseback; and Frances, duchess of Richmond, &c.; all of quarto dimensions. King James I. with his family, inscribed "Triumphus Jacobi Regis Angliæ qui ipsius ferolis;" James I. with prince Henry of Wales; sir John Haywood, accompanied by emblems; John George, duke of Saxony, also with emblematical accompaniments; and sir Henry Rich, in an oval, are all in folio; and the latter one of the most carefully finished engravings of William de Pisse.

A set of the five senses, with each a Latin verse, in quarto; a family of gyphers, dated 1621, in folio; and a family-piece, supposed to be that of the palatine, where the youngest child is represented playing with a rabbit, folio size. For the monograms of both these artists see our first plate of those used by the engravers of the Netherlands.

Simon, the youngest of the sons of Crispin, resided also for some time in England, where he was employed by Hilliard, who was the Reynolds of his day, and of whom Dr. Donne wrote that often-cited passage,

"A hand, an eye, by Hilliard drawn, is worth
An historie by a worse painter made."

For Hilliard, Simon de Pisse engraved the portraits of most of the royal family of England. He was afterwards employed by the king of Denmark, and probably died at Copenhagen. The latest of his works executed in England are dated 1613. They chiefly consist of portraits, with some few devotional subjects and book ornaments; and are marked with his initials combined in a cypher, which will be found in our second plate of those used by the engravers of the Netherlands. The principal portraits are those of king James I. and Anne his queen, on horseback, both in folio; prince Henry and queen Elizabeth, both in quarto; Robert Carr, earl of Somerset, an oval print, in folio; Frances Howard, countess of Somerset; George Villiers, duke of Buckingham; Francis Manners, earl of Rutland; sir Walter Raleigh; Thomas, earl of Arundel, from Mircvelt; William, earl of Pembroke, from Van Somer; George, archbishop of Canterbury, dated 1616; Accuna, earl of Condemare,

LOW COUNTRIES, ENGRAVERS OF THE.

Condomare, and plenipotentiary to Philip IV.; sir Thomas Smith, ambassador to Russia; Mary Sidney, countess of Pembroke; Robert Sidney, earl of Lisle, afterwards earl of Leicester; Henry Wriothesley, earl of Southampton; Lamoral, prince of Caver, and count of Egmont; Maurice, prince of Orange, all of quarto dimensions. Four whole-length portraits of celebrated dukes of Burgundy, John de Valois, surnamed the Intrepid; Philip de Valois, surnamed the Hardy; Philip the Good; and Charles the Timid, very rare etchings; the frontispiece to the works of the lord chancellor Bacon; a print, entitled "*Vanitas vanitatum et omnia vanitas*," with four verses in the Dutch language. "Our Saviour with the Pilgrims on their way to Emmaus," in folio; and "A Holy Family," where the infant Jesus is represented taking a grape from St. Anne, after Baroccio, are also from the graver of Simon de Passe.

The principal engravings of his sister Madeline we have already noticed in our article on *ENGLISH Engraving*. Her monograms are inserted in our *Plate I.* of those of the engravers of the Low Countries.

The family of the Galle are more prominent than praiseworthy in the history of Flemish engraving. Philip, the first of that family, was born at Haerlem in the year 1537, but resided chiefly at Antwerp, where he published a great number of prints, and where he died in 1612.

Philip understood the human figure, handled the graver with facility, and discovered a share of talent, that, if brought into action, and kept on the stretch, might have advanced the arts of his country; but commerce was the prevailing deity of the Low Countries, and he alone was esteemed meritorious who became rich. The present writer wishes he were not struck with too much of resemblance in this respect between the Low Countries at that time, and England at this.

Galle appears to have sacrificed all desire of improvement to the rapid production of those sets of mediocre engravings which from the fountains of Holland and Flanders began about this time to flow over the rest of Europe; and in effecting this purpose he was, unfortunately for the progress of art, joined by his own sons, and by the families of Wierix and Sadeler. Strutt very truly observes that in all their works we may trace the same stiff and formal style, with little variation, and without any attempt to add taste and freedom to correctness of form, or the smallest endeavour to enlarge the compass, or improve the harmony of chiaroscuro.

From these slight engravings of Philip Galle, which for the most part are marked with one or other of the monograms, which may be seen in our second plate of those of the engravers of the Low Countries, we select the following, as being most creditable to his abilities, and least unworthy of the modern portfolio.

A set of six, of portraits of reformers and other distinguished characters of the sixteenth century, viz. Martin Luther, John Calvin, Ulrich Zwinglius, Bilelaldus Pircheymer, Dante, and sir Thomas More; pedestrian statue of the duke of Alva; portraits of Martin Hemskerck, the painter, and William Philandre, a celebrated architect; all in quarto. A set of thirty-four from the life of St. Catherine. A set of six, in folio, of Sybils, &c. entitled "*Jesu Christi dignitatis virtutis et efficientie praeventus Sybills X.*" after Blockland. The Seven Wonders of the World, in folio; to which, as an eighth, Galle added the Amphitheatre of Vespasian at Rome, after M. Hemskerck. A set of seven battles, from Stradan; entitled "*Mediciae famulae gestarum*," in folio. "Our Saviour traveling with his two Disciples to Emmaus," in large quarto, from Brueghel; "The Death of St. Anne," in large folio,

from the same master; "The Holy Trinity," a grand composition, in large folio, from M. de Vos. This is esteemed the best engraving by Philip. "King Solomon superintending the Building of the Temple of Jerusalem," from Franc. Floris; "The Sacrifice of Isaac;" and "Mutius Scaevola, in the Tent of Porfenna;" both from the same master: all in large folio.

Theodore Galle was the eldest son of Philip, was born at Antwerp A.D. 1560, and having learned from his father the rudiments of engraving, made a journey to Italy, either with the view of improving himself in his art, or with that of rendering the profits of the print trade more productive or more secure. At Rome he engraved several plates, but adhered to the style of his father, though surrounded by the finest examples of superior art.

After his return to Antwerp, he continued occasionally to engrave; but print-selling was with him the business of life, and he published the works of other artists, as well as his own. His own have the defects of feebleness of chiaroscuro, and stiffness of style: yet the following prints from his hand, will shew, that in neatness he excelled his father, and was a better draftsman.

"Julius Lipsius," with allegorical accompaniments, explained by six Latin verses; "St. Jerome," in his caverly, in the act of adoration, both in folio, and of the oval form. A rare and large folio set of emblems, entitled "*Lites abusus*," &c. A set of small plates from "The Life of St. Norbert." A set of twenty-eight ditto, from "The Life of St. Joseph, and that of the Virgin Mary." A set of thirteen ditto, entitled "*Typus occasioms in quo recepta comoda, neglecta vero incommoda personata schemate proponuntur*;" (this is from his own designs, and is now become scarce.) "The youthful Saviour contemplating the Cross and Instruments of his Passion;" "St. John the Evangelist," and "St. Jerome," all of octavo size; a folio plate of "Count Ugolino and his Sons imprisoned in the Castle of Pisa," from the *Inferno* of Dante, after J. Stradan, a rare print; "The Roman Matrons beseeching Coriolanus to relent;" "Tiber resting on his Urn, and the Vestal Lucie receiving Water in a Sieve;" "Cornelia, the mother of the Gracchii, working with her Women," all of folio size. A frontispiece, after Rubens, entitled "Aug. Mascardi, filiarum, Lib. IV.;" and another frontispiece from Rubens, entitled "Las obras en Verlo de Don Francisco de Boria;" 1654: both of quarto size.

Cornelius Galle, (commonly known by the appellation of the elder Cornelius) was the younger of the sons of Philip, and was born at Antwerp in the year 1570. He imitated his father's manner of engraving, and followed the steps of his brother Theodore, though with far better success as an artist.

At Rome he resided a considerable time, and acquired there that freedom, taste, and correctness of drawing, which are found in his best works, and render them far more estimable than those of his relatives. He finally settled at Antwerp, and took a share in that considerable commerce for prints, which was carried on there by the family of Galle. Among other engravings from his hand, the following will be found more particularly worthy of notice.

Portraits of St. Charles Borromeus, cardinal and archbishop of Milan, an octagonal print, in folio; Philip Rubens, father to the celebrated painter, in quarto; John van Havre, and Mother Anne of Jesus, a Carmelite nun, in folio, both after Rubens; Artus Wolf, et, a painter of Antwerp, in large quarto, from Vandvke; Charles I. of England, in an emblematic border, from N. V. Horst, in large quarto; Henrietta Maria, the queen of Charles I. (surrounded by

three goddesses,) in quarto, from the same master; St. Antony, in folio; and Leopold William, archduke of Austria; of the same dimensions.

Historical Subjects, after various Masters.—"Adam and Eve," from John Baptista Paggi; "Venus caressing Cupid," both in large quarto; "The Return into Egypt," a circular plate, in large folio, from the same painter; "Jesus at the Table of Simon the Pharisee," in folio, from L. Civoli; "St. Peter baptizing St. Prisque," from the same painter, quarto size; "The Virgin and Infant Jesus, to whom St. Bernard presents a Laurel Branch and Book," in folio, from F. de Vanni; "Christ on the Cross," at the bottom of which is introduced St. Francis and St. Theresa, in large folio; likewise from Vanni. A landscape, wherein Venus is represented fastened to a tree, whilst Minerva scourges Cupid, in quarto, from Aug. Caracci; "The Virgin and Child," from Raphael; "The Entombing of Christ," in an octagon, quarto, from the same master; "A Statue of the Holy Virgin," in a niche, around which children are twining garlands of fruit and flowers, from Rubens; "Judith beheading Holofernes," in large folio, a capital print; "The Four Fathers of the Church," in folio, from the same painter; this plate was enlarged, but there are impressions from it of its original size, which are more highly valued by collectors, and which are known by a black streak down either side: "Progné discovering the Head of his Son and Wife, after he had eaten their Bodies," in large folio; as a companion to "The Rape of Hippodamia," by P. de Bailliu. A naked figure, called "The Colour Grinder," also from Bailliu, in folio; and a print, entitled "Romanæ et Græcæ Antiquitatis Monumenta, e prisce Numismatibus erecta per Hubertum Goltzium Antv. 1645."

A dray-horse never descends immediately from the high bred racers of Newmarket: but mental endowments are rarely hereditary. Cornelius Galle, the younger, so called in contradistinction to the Cornelius of the preceding article, inherited engraving and print-selling, but not talent, from his father. He was born at Antwerp A.D. 1600. He was educated under his father, and endeavoured to imitate his style of engraving. His mechanical execution is sometimes tolerable, but his drawing very incorrect. Strutt thinks that he may have wanted the opportunity of studying in Italy, as his relations had done: but as those relations had enriched themselves by trade, it is rather to be inferred that he wanted motive or inclination to travel thither.

The portraits of Cornelius are somewhat superior to his historical works; and the best of his portraits are those of the emperor Ferdinand III.; Mary of Austria, his consort; Henrietta of Lorraine; and John Mieslens, the painter, all in large quarto, and after Vandyke; a folio plate of Jodoens Christophorus Kup de Kuppenstein, (a senator of Nuremberg,) after Anselm van Hulle; and Octavius Piccolomini of Arragon, also in folio, with a border of fruit and flowers, after the same painter, &c. which latter is probably, on the whole, the best print of the younger Cornelius.

From his historical engravings, the following may be selected: "A Nativity, with the Angel appearing to the Shepherds," from D. Teniers; "Venus suckling the Loves," from Rubens; "The Descent from the Cross," from Diepenbeck; "The Hospitality of Baucis and Philemon," after J. Vanden Hoeck, in folio; "Job abandoned by his Friends and scolded by his Wife," after Diepenbeck, in folio; and a quarto plate from "The Life of St. Dominic," after Vanden Hoeck.

Hans or John Bol was born at Mechlin in the year 1534,

and died at Amsterdam in 1593. His inclination leading him to the arts, he was instructed in painting by a master of no great repute, whom he soon quitted; and, going to Heidelberg, assisted the progress of his own improvement by copying the works of eminent artists. His subjects are chiefly landscapes, with animals; but he likewise painted history and miniature with no small success. We have by him some etchings, in a free spirited style, that indicate the hand of a master: these he marked with a monogram, which will be found in Plate II. of those used by the engravers of the Low Countries: and among them are "The Meeting of Jacob and Esau," a quarto circular print; "The first interview between the Servant of Abraham and Rebecca," of the same size; "The twelve Months of the Year," circular, in 8vo.; two sets of landscapes, views in Holland, in 4to.; and a large print, lengthways, representing an aquatic diversion in Holland: a man appears in a boat, catching at a goose, which is fastened to a string over the river, and a prodigious number of spectators are depicted upon the banks.

Cornelius Cort was born at Hoorn in Holland, A.D. 1536. After having learned the first principles of drawing and engraving, (as Strutt conjectures, from Coornhaert,) he worked for a time as the assistant of Jerome Cock, and afterwards travelled to Italy to complete his studies.

At Venice, where he was courteously received by Titian, he made a long stay: some say he resided in the house of Titian. However this may have been, he engraved from several of the pictures of that much admired artist, and no doubt profited by his instruction and advice.

That his mind expanded in this genial climate of art, where Titian shone forth, there is indeed abundant proof to be obtained, by comparing his engravings after that master with those frigid works after Hemskerck, which he produced under the influence of Germany and Jerome Cock.

He began now to engrave larger plates, in a bolder and broader style than that to which he had hitherto been accustomed; and removing to Rome, established there an academy of engraving, in which several meritorious pupils (among whom was Agostino Caracci) listened with advantage to his instructions, and imitated his example with so much success, that Cort may with justice be reckoned among those men of genius who have contributed to the enlargement of the boundaries of the art itself. But the career of our artist, though brilliant, was short: he died at Rome, in the meridian of his reputation, at the age of two-and-forty.

Cort worked with the graver only, in a bold and manly style: his drawing, though sometimes neglected, is generally correct; and his chiaroscuro improves upon that of his predecessors. Even in the careless passages of his works, so much taste and freedom prevail, and so many indications of sound knowledge, that his negligence must ever be esteemed the negligence of haste, and of a too easy reliance upon the friendship of the spectator, which he believes he has conciliated: not that of ignorance.

Bassan, in estimating his merit, praises with justice the taste and lightness of touch with which he engraved landscape, without the assistance of etching; and adds, that "he was the best engraver with the burin, or graver alone, that Holland ever produced:" an encomium which our countryman, Strutt, thinks may be a little overstrained.

His print of "Christ praying in the Garden," which is probably engraven from his own composition, is marked with a small instrument, or utensil, near the feet of one of the disciples, which is usually taken for a lamp, and has sometimes been mistakenly attributed to an old master who flourished in 1509. On other occasions, according to Strutt, he marked his

LOW COUNTRIES, ENGRAVERS OF THE.

prints with the two small fighting cocks, which we have copied in *Plate II.* of the marks, &c. used by the engravers of the Low Countries; though for what reason cannot easily be imagined, as he was not a Frenchman, unless it were to denote that these engravings were performed by Jerome Cock and himself in conjunction.

The abbé Marolles possessed upwards of one hundred and fifty engravings by this master. Of these we are able to enumerate the following, beginning with his

Portraits.—Cornelius Cort, engraved by himself, in a quarto oval; a pair of Henricus II. Gallorum rex, and Catherine de Medicis, the French queen, in ovals of large quarto size; Don Juan of Austria; Marc' Antonius Moretus, a Roman citizen; Andrea Alciati, all in ovals; three portraits engraved for J. Cock, viz. Roger of Brussels, Theodore van Harlem, and Joachim Dionatinis, all artists; the genealogical tree of the illustrious family of Medicis, with the portrait of Scipio Amirato; the genealogical tree of the family of Cambi Importuni; and two busts of Democritus and Heraclitus, in 12mo.

Subjects from his own Compositions.—"The Birth of the Holy Virgin," in folio, dated 1568; "The miraculous Conception," wherein the Virgin Mary is surrounded by allegorical devices, dated 1567; "The Infant Jesus in the Temple;" "A Repose during the Flight into Egypt," 1568; "A Holy Family," wherein St. Joseph is represented giving a pear to the infant Christ; "The Last Supper;" "A Crucifix," supported by two angels, whilst others are displaying the tablets of the law, and a chalice; "The Resurrection of our Saviour;" "St. Theodore the Patron Saint of Venice, fighting with a Dragon;" "St. Catherine kneeling on the Instruments of her Martyrdom, crowned by two Angels;" "St. Verediana, a Virgin, kneeling before an Altar, with a Serpent at her Feet," 1570; two tempestuous sea-pieces; a frontispiece, representing the Virgin seated between two cherubs; "A Fawn placing a young Bacchus in a Niche;" "A Soldier carrying an Infant;" and "A young Man seated, drawing a Thorn from his Foot," all of folio dimensions.

Subjects engraved from various Flemish Masters, before Cort went to Italy.—"Adam and Eve;" they are seated under the tree of life, whilst a serpent, with a human head, presents an apple to Eve, from Michael Coxie; "The Resurrection of Christ;" "The Descent of the Holy Ghost;" "Our Saviour accompanied by Sts. Peter and Paul," all of folio size, from Michael Coxie; a series of four folio plates, from the parable of "Dives and Lazarus," after Hemskereck; another series of four, from the parable of "The good Servant;" and the parable of "The Vineyard," all from the same painter, in folio; a set of six, in folio, from "The History of Noah," from Franc. Floris; "The History of Abraham," in a set of the same number; "The History of Jacob and Rachael," engraved on six plates in the form of a fan; "The Labours of Hercules," in ten folio plates; "The History of Pluto and Proserpine," in four plates of folio size; "The Triumph of Bacchus and Venus," all from the same; an emblematical subject on the immortality of virtue, after Franc. Floris, both in large folio; "The Descent from the Cross," after Van der Wyde, in folio; a standing figure of St. Roch, from J. Speckart; and St. Lawrence, from the same painter; "St. Dominic reading," from B. Spranger; "A Holy Family, surrounded with Angels," from the same; "The Virgin crowned in Heaven," after G. Moitaert; and "The Painting Academy," after Stradan, all of folio dimensions.

Subjects engraved in Italy from various great Masters.
1. *From Titian.*—"The Annunciation," in large folio;

"The Martyrdom of St. Lawrence," of the same size; another "Annunciation," in folio; "The Holy Trinity," known by the appellation of "the All-powerful," in large folio; "St. Jerome reading," in folio; another folio plate of "St. Jerome, at the Entrance of his Cell, prostrate before a Crucifix," a very rare print, omitted in Heineken's catalogue of the works of Cort: a half figure of "A Magdalen;" another "Magdalen in the Desert, before a Crucifix;" "Tarquin and Lucretia," folio size; "Diana and Calista," large folio; "Prometheus chained to the Rock;" and "Rinaldo delivering Angelica from the Dragon," both in large folio.

From Jerom Mutian.—"St. Peter walking on the Sea;" "Christ crowned with Thorns;" "Christ bearing the Cross;" "The Descent from the Cross;" "Jesus Christ appearing to the three Maries, and St. John, on their way to Jerusalem;" another "Descent from the Cross;" "St. Jerom meditating;" all of folio dimensions; and "The seven Penitents." These are large landscapes, in which are introduced small figures of the saints, Mary Magdalen, Jerome, John the Baptist, Hubert, Onophrom, Francis (stigmatised), and Francis (in ecstasy): six of them are upright plates, and the seventh lengthways.

From Julio Clovio.—"The Annunciation;" "The Adoration of the Kings;" a half figure of "The Virgin holding the Infant Jesus;" and "The youthful Jesus preaching in the Temple;" all in folio. "Jesus baptised by St. John in the River Jordan;" and "The Crucifixion," both in large folio; "The dead Body of our Saviour, and one of the Maries kissing his Hand;" "The Entombing of Christ," in folio; "Christ appearing to Mary Magdalen," of the same size; "The Conversion of St. Paul;" "Christ on the Cross," a grand composition, both in large folio; and "St. George and the Dragon," in folio.

From Taddao Zuccaro.—"The Creation of Adam and Eve," in large folio; "The youthful Virgin presented in the Temple," in folio; a large folio plate of "The Nativity," a rich composition; "A Holy Family," wherein St. John holds a lamb; "The Miracle of the five Loaves," both in folio; "The Body of our Saviour before the Sepulchre," a grand composition; "The Descent of the Holy Ghost," both of large folio dimensions; and a folio print of "The Martyrdom of St. Agatha."

After Frederic Zuccaro.—"Moses and Aaron before Pharaoh;" "The Birth of the Virgin;" and "The Conception of the Virgin," who is supported and crowned by angels; "The Annunciation of the Virgin;" "The Nativity," a grand composition, all in large folio; "The Adoration of the Magi;" "A Holy Family," where a cat is introduced catching a bird; "The Flight into Egypt;" "Our Saviour tempted in the Wilderness;" "The Woman taken in Adultery;" "Jesus turning the Money-Changers out of the Temple;" "The Resurrection of Lazarus;" "The good Samaritan;" "St. Peter chosen Head of the Church;" "Our Saviour on the Mount of Olives;" "The Jews approaching our Saviour in the Garden of Olives;" "The Death of the Virgin;" "The Coronation of the Virgin;" "St. Lawrence and St. Sixtus," surrounded with an ornamental border, all of folio dimensions; "The Dispute of the Holy Sacrament," in large folio; "Labour and Justice," an emblematical subject, in folio. A large satirical print on the officers of pope Gregory XIII., representing a young man accused by Calumny and protected by Innocence, before a judge, with the ears of an ass, (the whole of which is taken from Lucian's description of a lost picture, by Apelles): and another satirical print engraved on two large plates; in the lower part of the composition is introduced

introduced a painter sitting at his easel, painting the portraits of certain celebrated simpletons of the day; in the upper part sits Jupiter on his throne, surrounded by all the gods, protecting the arts and sciences; a very capital and rare print.

From Raphael d'Urbino.—"The Transfiguration," from the celebrated picture in the Vatican; "The Contest between the Romans and Pyrrhus," known under the appellation of "The Battle of the Elephants," both of large folio size. A large print, executed on three separate plates, of "The Victory of Constantine over the Emperor Maxentius, at Ponte-Molle." Cert left this plate unfinished at his death, but it was afterwards completed by Ph. Thomassin.

Subjects from various other Italian Masters.—"Mount Parnassus," a folio print, from Polidore; "The Adoration of the Shepherds," in large folio, from the same master; "A Repose during the Flight into Egypt," in folio, after B. Bassano; an unfinished print, in folio, of "The Apotheosis of St. Jerome," from the same master; "The Visitation of St. Elizabeth," a large folio print, from Marc de Sienna; "The Adoration of the Shepherds," a folio print, from the same master; another of "The Adoration of the Shepherds," from Paris Romano; "The Virgin sitting near a Fountain, with the Holy Infant, and St. John," in folio, from F. Baroccio; a folio print of the "Baptism of our Saviour," after F. Salviati; "The Marriage of Cana," from Lorenzo Sabbatini, in folio; "The Last Supper," after L. Agresti Forlivesano (there are impressions of this plate both with and without the mark of Cort), in large folio; "St. Stephen stoned," in large folio, from Marcellus Venusius; "St. Jerome before a Crucifix," after Riccio da Sienna, in folio; "St. Jerome, attended by two Angels," from Jacobus Parmensis, in folio; "The Girdle of St. Francis," after Caracci, in large folio; a quarto print of "The Marriage of St. Catherine;" a folio print of "St. Margaret of Cortona," from Tempesta; "A Dance of Dryades," in folio, from Maitre Rous, of Florence; "The three Destinies," from Julio Romano, in folio; and "The Tombs of the Dukes of Mantua," in large folio, after Michael Angelo.

Of Philip de Sorge, Sericeus, or Sytina, very little is known. Strutt speaks of the few prints which we shall venture to ascribe to him, as being the production of two artists: Rost and Huber are more probably in the right, in ascribing them to one. Sericeus studied under Cornelius Cort, and afterwards settled at Rome, where it is probable, from the scarcity of his works, he died at an early period of life; but neither the time of his decease, nor that of his birth, have been mentioned.

His style of engraving, evidently formed upon that which we may term the Italian style of Cort, is open, vigorous, and free; but his knowledge of the figure was inferior to that of his master, and his chiaroscuro, though not discordant, not very forcible.

We are acquainted with no other of his works than a set of twenty-eight half-length figures of the popes in chronologic succession, from the year 204 to 1568, the year in which they were published; they are in small folio, and executed with the graver only, in a stiff, slight manner. Pope Pius V. surrounded with emblematical figures, designed by Sericeus himself, and engraved in a style superior to the former. "Judith beheading Holofernes," in folio, after Julio Clovio; "The Angel warning St. Joseph to depart into Egypt," from C. Cort, of the same size as the original; "St. Francis receiving the Stigmatics," in large folio; "St. Jerome before a Crucifix in the Desert," sup-

posed to be from Mutian, in large folio; "The Virgin and Infant Christ," known by the appellation of "The Virgin of Silence," inscribed "Dormiente puero Jesu divina Mens vigilat," with the name of Philip Sericeus, dated 1566, in large folio; a large folio print of "Our Saviour on the Cross," with the Virgin and St. John the Evangelist, on either side at the foot of the cross, after Michael Angelo; and a large folio print, which is attributed to Soye, although it bears the name of Cort, representing "Prometheus chained to a Rock," from Titian's picture in the royal palace at Madrid.

John Ditmer, or Ditmar, was a native of the Low Countries, and born in the year 1538, or thereabouts. By this engraver we have a middling-sized upright plate, nearly square, representing a figure of Christ seated on the clouds, with the symbolical animals, seen in vision by the prophet Ezekiel, and which are the usual attendants on the evangelists, and angels bearing the cross, crown of thorns, &c. It is executed in a style greatly resembling that of Cort, but coarser, and by no means so well drawn as the works of that master generally are. This print is after Michael Coxie, and is dated in the year 1574, nor are we able to specify more of the works of this engraver, who was apparently instructed in his art by Cornelius Cort.

Gerard de Jode was born at Antwerp in the year 1521, and died in the same city A.D. 1591. He was celebrated both as an engraver and geometrician, and was the son of Cornelius de Jode, a well-known geographer. Part of his youth was passed in the service of the emperor Charles V., after which he gave up his attention entirely to the arts and sciences. He engraved some geographical, and a great number of historical, plates, in the style of his contemporaries and countrymen, Wierix and the Collaerts, and Papillon says that he executed some meritorious engravings on wood.

He likewise established at Antwerp a printseller's shop, which, after his death, was carried on by his widow. Being hereditarily known as a geographer, in which science he excelled, he was much encouraged by Ortelius, who was furnished the Ptolemy of his age, and of whom we have spoken under the article *ENGLISH ENGRAVING*. The principal works of Gerard de Jode, are a set of twenty-nine, of the portraits of the popes, in 4to. published in the year 1585. A Roman triumph, on twelve plates, after Hemikerck, in 4to. A set of thirteen, intitled "Memorabilium, novi Testamenti, templo Gestorum leones tredecim elegantissimi ac ornatissimi. Antwerpia excudebat Gerard de Jode," in folio, with architectural back-ground, and a very large and well engraved print, executed on three plates of "The Crucifixion," after Michael Angelo.

Peter de Jode, the elder, was born at Antwerp A.D. 1570, and died in the same city in 1634. He was the son of the preceding artist, who instructed him in the knowledge of geometry and drawing, but he studied engraving under Henry Goltzius, and afterwards travelled to Italy and to Paris, to improve his connections and complete his professional studies. In Paris he remained some time, and with the assistance of his son, executed several plates there, which were published by A. Bonenfant. He returned to Antwerp a few years after the commencement of the succeeding century, where he remained till the time of his death.

The engravings of the elder Peter possess great merit. He was an excellent draftsman; his chiaro-scuro is not inferior to that of the age in which he lived; and in his manual execution he used the graver alone, in a manner evidently founded on the neater style of Goltzius, but not with equal freedom, nor equal power of expressing the variety of substances.

stances which entered into the compositions from which his prints are engraven.

He engraved both portraits and history with success, but did not excel in landscape. From the whole of his works, which are somewhat numerous, the connoisseur may select the following with advantage.

The *Portraits* of Henry du Puy, a Dutch philosopher, in a circle surrounded by a serpent, in 4to.; John B.accio, from Titian, in folio; Ferdinand, count palatine of the Rhine, in an oval, from Rubens, quarto size; Philip III., king of Spain, in an oval, from Rubens; Francis de Mello, count of Azumar; Ambrose Spinola, surnamed the Great General, all of quarto dimensions.

Historical, &c.—"The Virgin and Child," from Titian; "The Marriage of St. Catherine," both in quarto. A large folio print of a "Holy Family," in a mountainous landscape, both from the same painter. Twelve prints of "The Life and Miracles of St. Catherine of Siena," after Francis Vanni, in folio; "The Adoration of the Shepherds," likewise in folio; "Christ at the House of Nicodemus," a night-piece, in large quarto; "The Decollation of St. John," in an oval, of octavo size, a rare print, from Rubens; "Our Saviour delivering the Keys to St. Peter," in folio; "The Coronation of St. Catherine," in folio. An allegorical subject of government, represented by a female crowning Prudence with a laurel wreath, in 4to. Another, of "The Five Senses," in folio. The frontispiece to a book, intitled "Annals of Flanders," by M. Suuro, representing Flanders, personified, leaning on a pedestal &c. &c. in folio, all from Rubens. Thirty-six prints in quarto, from the "The Life of Christ," and "The Last Judgment," after a picture by John Cousin, in the church of the Mission at Vincennes. The painter has introduced his own portrait at the left hand side of the print. This is one of the largest prints in existence, being engraved on twelve plates!

Peter de Jode, the younger, the son of him who is the subject of the preceding article, was born at Antwerp, according to Strutt and the foreign authorities, in the year 1606. He studied under his father, whom he surpassed in taste and facility of handling the graver, though he can scarcely be said to have equalled him in the drawing of the naked. Our countryman, Strutt, though generally not deficient in accuracy of notice, has contributed to confuse the chronology of this artist and his father. He says, "it does not appear that the younger de Jode went to Italy, but he certainly accompanied his father to Paris, where they engraved conjointly a considerable number of plates for M. Bonenfant, and le Sieur Plinago," which, if our author's report of the return of the elder de Jode from Paris might be credited, is making the son travel to Paris and engrave, before he was born; for Strutt, in his account of the father, expressly says, "he returned to Antwerp about the year 1601, where he resided till the time of his death."

Perhaps the senior de Jode returned from his first journey in 1601, and afterward, as he did not die till 1634, made a second journey to Paris, taking with him his son.

The prints of the junior de Jode are numerous, but very unequal in merit. Baffan says of him, that in several of his engravings "he has equalled the best engravers, and in others has sunk below himself." To which Strutt justly adds, "he was, without doubt, a very able engraver, but to place him (even in his best exertions) upon an equality with his contemporaries, Bulwer, Pontius, and Vorsterman, is, in my opinion, estimating his abilities at much too high a rate."

Among his most esteemed performances may be mentioned the following

Portraits of celebrated artists, &c. after the pictures of Vandyke, of small folio size. Peter de Jode, senior, engraved by himself; James Jordans, painter of Antwerp; Cornelias Poelenbourg, painter, of Utrecht; John Smellinx, painter, of Antwerp (the flesh of which is etched); Adam Colter; Andrew Colyns de Nolo, a statuary of Antwerp; Genevieve d'Urphie, the widow of Charles Alexander, duke of Croye; Jean de Blois; Henry Liberti, an organist; John Tzerdacs, count of Tilly; Albert, duke of Friedland, and count of Wallenstein; Diodorus de Tulden, professor at Louvain; Antonio Triest, bishop of Ghent; Charles Henri, baron of Metternich, in an ornamental border; Augustus Adolphus, baron of Trantorff, surrounded with an ornamental border, all of folio size; Thomas Ricciardi; Simon Vouet del, in 4to.; Ernest, count of Hensbourg, chevalier of the golden fleece, a half-length portrait, in armour, after Th. Willeboorts, in 4to.; and a folio print, entitled "Petrus de Francavilla, Gall. Regis Architect et Sculptor," after J. Buel.

Historical Subjects.—"St. Augustine," bishop of Hippo, crowned by Religion, with other accessory emblems, in folio; "St. Francis kneeling before a Crucifix," after Baroccio, in folio; "A Holy Family," where Elizabeth, St. John, and Zacharias, are explaining a book held by an angel, in large folio, from Titian; "An Emblem of Death," represented by an infant sleeping upon the ground, with a skull lying by his side, a small plate, lengthways, from Artemisa Gentilesea; "The Visitation of the Virgin," from a picture by Rubens, in the cathedral at Antwerp, in large folio, a very fine and rare print. A fine print of "The Three Graces," in large folio; "Venus rising from the Sea," surrounded by nymphs and tritons, in large folio; "The Alliance of the Earth and Sea," personified by Cybele and Neptune, a plate of folio size, as a companion to that of "Plenty," by Theodore van Kessel, all after Rubens; "St. Francis and St. Clara, worshipping the Infant Christ, lying in the Manger," half figures, with the effect of night, in folio, after G. Seghers, the companion to which is "St. Peter denying Christ," engraven by And. de Paulis; "Christ discoursing with Nicodemus," half figures, with the effect of night, from the same painter; "The Nativity," from Jordans, a very fine and rare print, in large folio; "St. Martin of Tours expelling the evil Spirit from a Demoniac," very large folio; "Folly and Ignorance," half figures, a large folio plate, all from Jordans; "St. Augustin surrounded by Angels," a large circular plate, after Vandyke; "Rinaldo and Armida," a large folio plate, from the same master, being the companion to another plate, which Baillen engraved after the same painter; "A Holy Family," where the infant Christ is held by St. Anne, after Abr. van Diepenbeck. An allegorical subject of "Peace," and "St. John the Baptist in the Desert," from Van Mol, all large upright plates.

Arnold de Jode, the son of Peter de Jode the younger, was born at Antwerp in the year 1636, and was instructed by his father in the art of engraving. In his youth he migrated to England, but being no great proficient in his art, was not able to contribute much to the advancement of English engraving, though the art in this country was then at a low ebb.

He resided here at the time of the great fire of London, as may be learned from an inscription beneath his print of "The Infants Christ and St. John embracing each other," after Vandyke, which runs thus, "Arnoldus de Jode, Sculp."

sculp. Londini, tempore incendii maximi." It may be worthy of note, that this engraving is dedicated to sir Peter Lely, who was at that time the possessor of Vandyke's picture.

It seems not improbable, that the low state of English taste, and paucity of artists at that period, enabled Arnold to live with more profit and consequent comfort in this country than in his own, for his talents were very indifferent, and by no means commensurate to his early opportunities of acquiring professional information.

It may be sufficient to mention the following prints from his graver, of which the portraits will, generally speaking, be found the best.

The *Portraits* of sir Peter Lely, in large folio, from a picture by sir Peter himself; Alexander Browne, (prefixed to his *Ars Pictoria*), in small folio, from J. Huyfsmans; Catherine Howard, duchess of Lenox, &c. in folio, after Vandyke; cardinal Palavicini, in 4to. after Titian.

Hijloical, &c.—"Mercury instructing Cupid," in small folio, from Correggio, engraved in London, and dated 1667; "A Magdalen," a half-length figure from Vandyke. The folio print after Vandyke, mentioned in his biography above; and a landscape after L. de Vadder, in folio.

In the sixteenth century, the orthography of proper names, as well as that of words, appears to have been extremely unsettled. On the continent, as well as in this island, men spelled variously, as they variously estimated the powers of letters, and Printing was as yet too young to have erected a standard.

John Wierix, Wierx, Wierinx, or Wirings, (for thus capriciously has the orthography of this name varied from itself,) was born at Amsterdam, in the year 1550. His love for the arts appears to have manifested itself at a very early period of his life. We know not from whom he learned the first principles of drawing and engraving; perhaps he owed them, as well as his subsequent progress, principally to his own application and patient industry. He studied the works of Albert Durer very attentively, and built his taste upon them; but from too close and servile a mode of copying them, he contracted a stiffness, of which he never divested himself. There is little or no originality in his prints. His genius seems to have been confined, and he was fearful of venturing beyond the bounds of a copyist. The incomparable neatness of his works executed with the graver only, gives them, however, a value with the curious collector, which is increased by the correctness of his drawing, and the manner in which the extremities of his figures are marked, proves the great attention he must have paid to that part of his profession. His works are exceedingly multifarious, consisting of devotional subjects of various kinds and sizes; from which the following may be selected as affording, on the whole, the most satisfactory specimens of his abilities.

Portraits of Rodolpho II. emperor of Germany; Philip William, prince of Orange, in 4to; Eleanor of Bourbon, princess of Orange; James I. of England, with his queen, whole lengths, a small upright plate, very scarce; Philip II. of Spain; Catherine of Medicis, wife of Henry II.; Henry III. of France; and the counts of Verneuil, all of quarto dimensions; the last is a companion to the portrait of Henry IV. engraved by Goltzius.

Subjects from his own Compositions.—A small print of "Christ and the Virgin;" "The Resurrection," in octavo; "The Jesuit Martyrs," in 4to. with an explanation; an allegorical subject, called "The Penitent Heart," with

Dutch inscriptions; "The Magdalen," at the entrance of a cell, reading before a crucifix, a very beautifully finished print, both of quarto dimensions; an allegorical print, called "The Redemption of Man," in folio; and "The four Elements," of the same size.

Subjects from various Masters.—A small Satyr, from Albert Durer, engraved by Wierix at the early age of twelve, in 12mo; "Adam receiving the forbidden Fruit from Eve;" a small upright plate, laboriously copied from the celebrated print of the same subject by Albert Durer. It is dated 1566, and Wierix has added his own age, which was only sixteen; "St. Hubert at the Chase, prostrate before a Crucifix," a very fine copy from Albert Durer, (whose cypher it bears,) in large folio; "St. Jerom in Meditation," a very good copy, done at the age of thirteen, in folio; "The Marriage of St. Catherine," after Dennis Calvaert, in quarto; "The Sacrifice of Isaac," from M. de Vos; "Elias translated to Heaven;" "Christ taken from the Cross," after Otto Vanius; "The Last Judgment," from Michael Angelo, a fine copy from the print by Martin Rota; and another "Dead Christ," after Bernardino Passeri, all of folio dimensions.

Hieronymus or Jerome Wierix, was also born at Amsterdam in the year 1551, and is believed to have been the brother of John, of whom he learned the principles of drawing and engraving, and imitated his style with so much precision, that it would be a matter of the utmost difficulty to distinguish the works of the one from those of the other, were it not for the marks with which they are inscribed. The prints of Jerom possess the same extraordinary neatness, which we admire in those of John, are as correctly drawn, equally deficient in taste and freedom, and equally the result of careful labour.

Jerom Wierix marked his plates with his initials, or a monogram, which will be found in our second plate of those used by the engravers of the Low Countries. His works are still more numerous than those of his elder brother; and those most worthy of esteem, are the following.

Portraits of the emperor Charlemagne, in octavo, decorated with imperial ornaments; Henry of Bourbon, king of Navarre; queen Elizabeth of England; Sigismund III. of Poland; Alexander Farnese, duke of Parma; and sir Francis Drake, all of very small size; John Corepi Becani, a physician, holding a skull, in folio; De Constaen, and G. Oberstiech Delpheus, also in folio.

Subjects from his own Compositions.—"St. Francis," in 12mo.; "St. Cecilia," in quarto; "St. Anthony, held by the Devil," in 12mo.; "St. Bruno," in octavo; "St. Charles Borromeus," of the same size; "St. Anthony and St. Francis, to whom the Virgin presents the Infant Christ;" "The Holy Virgin suckling the Infant Jesus;" "The Virgin standing on a Crescent, with the Holy Infant surrounded with Rays of Glory," both in 12mo.; "The Miraculous Conception;" "The Death of Lucretia;" "The four Monarchies of the World," on four quarto plates; "Christ on the Cross suspended from a Vine, surrounded by four Saints," all of quarto size; another "Christ on the Cross, in the midst of a Vine, surrounded with Rays of Glory," the crucifix is supported on a bunch of grapes, which is held by the two Israhitish spies of the bible, an odd conceit, in 8vo.

Subjects from various Masters.—"A dead Christ, supported upon the Lap of the Virgin," after John Mabuse; "Christ receiving little Children," from Crispin van den Broeck; "Christ on the Cross," at the bottom of which is introduced the king David, St. Paul, and St. John the Baptist, after the same master; "A Holy Family," where St. Catherine

LOW COUNTRIES, ENGRAVERS OF THE.

therine is introduced kissing the feet of the infant Jesus, after Dennis Calvaert; "The Death of the Virgin," from Otho-Vænus; "Christ at the Table of Simon the Pharisee," after the same painter, all of folio dimensions; "Death and Satan," combating for a tree, while a saint and the holy Virgin are imploring Jesus Christ to preserve it, after H. van Balen, in octavo; "The Globe of the Earth near its Destruction, upheld by Jesus Christ and the Virgin," in octavo; "The opposite Roads to Heaven, and to the Infernal Regions," in quarto, from the same painter; "Our Saviour crowned with Thorns," after G. Mollart, in folio; "Jesus Christ on the Cross, worshipped by two Angels, in the Clouds," on one side of the cross is introduced the Virgin, and on the other St. John, whilst the Magdalen embraces the cross; (this is esteemed the finest print from the graver of Jerom;) "Enoch translated to Heaven," after M. de Vos, in folio; "The Death-bed of the Just," in large folio, from Amb. Franck; "Jesus baptised by John," after H. Hondius, in folio, a fine engraving; "The Visions of Daniel," after Van Haecht, in quarto; "Jupiter descending to Danae, in a Shower of Gold," from the same painter: a very capital print, after Lucas Romanus, of "The Resurrection of Christ," in large folio; and another, from the same painter, of "The Scourging of Christ," which Strutt pronounces one of his largest and best engravings, though not so neat as his other works.

Antony Wierix was the younger brother of Jerome and John, and, in general, adopted the same neat and laboured style of engraving, especially when he worked upon small subjects; but some of his larger prints are executed with more freedom; which, of course, adds greatly to their interest, in the estimation of persons of taste. Antony drew as correctly as his brother, and employed his graver upon the same sort of subjects; often indeed working conjointly with Jerome. We shall mention the following

Portraits, (all of which are very small,) pope Clement VII.; Philip Emanuel, of Lorrain, duke of Mercœur; Isabella, of Austria, daughter of Philip II. of Spain; Robert Bellarmine, cardinal; and Albert of Austria, archbishop of Toledo, and governor of the Low Countries, in quarto.

Subjects from his own Compositions.—Saints "Theresa," in octavo; and "Sebastian," in folio; "St. Dominic receiving a Rosary from the Holy Virgin," "The Virgin Mary," and "The Marriage of St. Catherine," both in 12mo.; "The Litany of the Virgin," in eight leaves, of octavo size; "The Virgin and Child, to whom the eternal Father displays the Instruments of the Passion," in 12mo.; "The purified Souls," with French and Latin verses in octavo; "Christ surrounded with the Representations of the Sufferings of various Martyrs," in quarto; "The Emblems of future Rewards and Punishments," in octavo; and "St. Jerom praying, accompanied by two Angels," in quarto; one of the best engravings by Antony Wierix.

Engravings from various Painters.—"Abraham sacrificing Isaac," and "The Adoration of the Kings," both in folio, and from M. de Vos. Four plates in quarto, representing the History of the prophet Jonas. "Resignation," personified by a female, fastened to a rock, holding a crucifix, while an angel crowns her with laurel, from J. de Backer, in folio; "A Repose during the Flight into Egypt," where St. Joseph is represented holding a bunch of grapes, after Cam. Procacini, in folio, executed in a bold broad style; "The Death of St. Francis," in folio, from the same painter; and "The Life of Christ," to which is added "The Death and Assumption of the Virgin Mary," with explana-

tions, forming a set of fifty-nine prints in folio, engraved conjointly by the three brothers, John, Jerom, and Antony.

Abraham de Bruyn, or Brun, was born at Antwerp in the year 1540; and established at Cologne. On account of the smallness of his productions he has been ranked in that class of artists, which is distinguished by the appellation of the *little masters*, and seems hardly to have merited even the distinction which he attained; for his prints are evidently rather the productions of labour and assiduity, than of genius. The lights in them are scattered and unharmonized, which destroy the effect, and give them a cold, metallic appearance, and his drawing is incorrect. It is true, Rembrandt had not yet dawned, and intention to the chiaroscuro has been termed by the apologists of such artists as Bruyn, "rather the fault of the age, than the professor;" and notwithstanding these defects, the works of this artist are much sought after by connoisseurs. The two monograms, which he affixed to his prints, will be found in our second plate of those used by the engravers of the Low Countries; and his best engravings are entitled as follows:

Portraits of the elector palatine, Philip Louis, and Ann his wife; Albert Frederick, duke of Prussia; William, duke of Juliers, and Mary his duchess; John Sambucus, physician (a wood engraving); "Carolus nonus Francorum Rex;" and Anne of Austria.

Historical. &c.—"Moses and the burning Bush," in quarto; "The Four Evangelists," "Christ and the Woman of Samaria," and "A Philosopher," with a scroll, both in octavo. A set of seven small plates of "The Planets," and another set of "The Five Senses;" a folio print, entitled "Imperii ac Sacerdotii ornatus, diversarum gentium vestitus;" another of the same size, entitled "Diversarum gentium armatura equestris, 1577;" a set of forty-nine, inscribed "Omnium fere gentium imagines," &c. quarto size. Seventy-six plates, of figures of knights on horseback, in octavo. A set of friezes, of the various modes of hunting and hawking, marked with his two cyphers. Twelve plates of animals, in quarto; "Pyramus and Thisbe," after Franc. Floris; "The Resurrection of Lazarus," from Crispin vanden Broeck, both in quarto; and a set of small arabesque ornaments.

Nicholas de Bruyn was born at the same place with the former artist, of whom he was the son, and of whom he learned the rudiments of his art; though he did not imitate him either in his style of engraving, or the smallness of the prints which he executed. He rather copied the style of Lucas Jacobs of Leyden, whose works he appears chiefly to have studied; and engraved large plates, which he executed entirely with the graver, in a very neat but laboured style. His prints evidently prove, that he had more fertility of invention than taste, and he wanted judgment to select such forms only, as were beautiful or suited to the occasion. His compositions are generally crowded with figures, but from the following causes his effects are feeble; the lights are too much diffused, and the breadths of shadow by no means sufficient to relieve the principal objects from those at a distance; in consequence of which, the whole appears confused and unfinished. His drawing is carefully attended to; but it is rather mannered than correct. The heads of his figures are frequently very expressive: yet, amidst all the disadvantages which this artist laboured under, much sterling merit is conspicuous in his productions. The cyphers, with which he marked his plates, will both be found in our second plate of those used by the engravers of the Low Countries: and amongst his works we shall select the following as being most worthy of notice.

From his own Compositions.—"Adam and Eve in Paradise,"

LOW COUNTRIES, ENGRAVERS OF THE.

dise," in large folio; "Adam and Eve eating of the forbidden Fruit;" "The grand Festival of the Jews, after six Years Bondage;" "The King Balac, communing with the Prophet Balaam;" "The Prophet Jeremiah," in a landscape; "The Vision of Ezekiel;" "David and Goliath;" and "Abigail meeting David;" both with landscape backgrounds; "Solomon and the Queen of Sheba;" "Solomon adoring the Idols;" "The Dream of Nebuchadnezzar;" "Daniel in the Lion's Den;" "Sufannah and the Elders;" "Sufannah justified;" "Two old Men stoned to Death;" "The Nativity of our Saviour announced to the Shepherds;" "The Adoration of the Eastern Kings;" "A Repose during the Flight into Egypt;" "The Slaughter of the Innocents;" "St. John preaching in the Desert;" "Our Saviour preaching on the Mount;" "The Centurion imploring the Help of Jesus Christ;" "The Entry of Christ into Jerusalem;" "Our Saviour on his way to Mount Calvary;" "The Crucifixion;" "The Resurrection;" "St. Paul preaching;" "St. Hubert perceiving a Crucifix between the Horns of a Stag;" "Orpheus charming the Animals with his Lyre." Peasants, with their children, regaling; a landscape, into which is introduced lions, tigers, and flags; a large company of Spaniards in a forest; all these are of large folio size; a set of six prints, in octavo, for goldsmiths, from fables; twelve plates of animals for a book of quadrupeds; and two sets of thirteen each, of birds and fishes.

Subjects from various Masters.—"St. John preaching in the Wilderness," from Lucas of Leyden; "A Miracle performed at the Tomb of St. James," a Spanish apocryphal, from the same painter; "The Golden Age," from Abr. Bloemart; this is considered as his finest print, and was admirably copied in a small circle by Theodore de Brye; "Abraham sacrificing Isaac," after Giles Cominxlo; "The Predictions of the Prophet Isaiah;" "The Judgment of Midas," a fine landscape, with figures, all from the same painter; a village fair, from Dav. Vinckenbooms; a landscape, with a castle; a view of a garden, with buildings, and figures dancing, both from the same painter; a stag hunt, after John Breughel; a fine landscape, into which is introduced the subject of "Moses defending the Daughters of Jethro," after Hans Bol.; "St. Cecilia," accompanied by other saints, copied, with some alteration, from Raphael; "The Four Seasons," from M. de Vos; and an armed knight on horseback, preceded by an allegorical figure on horseback, and followed by the devil on foot, copied from what is commonly termed "The Worldly Man" of Albert Durer; all are of folio dimensions.

The family of the Sadeler make a very considerable figure in the annals of engraving: yet are they, unless we should except Giles, less illustrious by the character of their works as engravings, than worthy of notice on account of their number, subjects, and the period at which they were performed.

Hans or John Sadeler was born at Brussels, A.D. 1550. His father is believed to have been an armourer, or workman in iron and steel; for the first employment that is known to have been exercised by John, was to engrave ornaments, &c. upon those metals, in order to their being inlaid with the precious metals. Hence Florence le Comte terms him a *damasquinneur* of iron; a word which probably, at that time, was the proper technical denomination of that particular branch of the armourer's profession, and which is perhaps derived from Damascus, where arms have been fabricated with similar ornaments from a very early period.

It appears, however, that our artist did not confine himself to the scroll-work and heraldic ornaments, which were

prevalent at the time, but applied himself with requisite diligence, at an early period of life, to the study of the human figure, of which he evinced an accurate knowledge; though, in consequence of early tuition, and the Flemish and German examples which had been placed before him for imitation, he drew in a stiff and mannered style.

From these early shackles, however, which, till Rubens appeared, Flanders unwittingly forged for all her sons, Sadeler in a great measure emancipated himself, when he came to strengthen his faculties by breathing the purer atmosphere of art that circulated in Italy.

He did not at once travel from Brussels to Italy, but published several of his earlier engravings at Antwerp; from whence, in the year 1588, he went to Frankfort, and continued to travel over great part of Germany, in order to obtain instruction from the best masters who were then living in that country. At Munich he remained a few years, where his merit being made known to the duke of Bavaria, he was very graciously received; and that nobleman made him a present of a chain of gold. From Munich he went to Verona; from thence to Venice, and afterwards to Rome; but not meeting with the encouragement he expected from the pope, he returned to Venice, where he established himself, and died in that city of a fever, in the year 1600. It is uncertain from whom he first learned the art of engraving; but it appears that he availed himself of the instructions of a variety of masters. His earliest productions have much of that stiffness, not only in drawing, but in point of manual execution, which eclipses the merit of the old engravings of the German school. It is true, that after he resided in Italy, he made a considerable improvement in his style of engraving, especially in the landscape parts of his plates; but he never entirely divested himself of the habit he at first acquired. He worked with the graver only, in a clear neat style; but his plates were never highly finished. We see in them, however, the hand of a very able artist, much correctness of drawing, and great expression. His engravings are exceedingly numerous; and though a complete collection of them is rarely to be seen, detached prints and sets of prints are by no means uncommon. They are usually marked with his initials combined in a cypher, for which see *Plate II.* of those used by the engravers of the Netherlands. The following are those which are held in most estimation.

Portraits.—Orlando Lassus, master of the chapel of William, duke of Bavaria, in 8vo.; Sigismund Feyerabend, a famous printer of Frankfort-on-the-Maine, in 4to.; George Hoefnagel, an artist of Antwerp, and one of the coadjutors of Ortelius the geographer, an engraving of merit, in 4to.; her royal highness Mary de Medicis, queen of France and Navarre; Charles, prince of Sweden and duke of Sudermania; Christoffer, baron of Teuffenpach, from J. ab. Ach., all in 4to.; a three-quarter portrait of Herdesianus, a celebrated juris consulte, with twelve Latin verses, in folio; a profile of Martin Luther, in folio; Otho Henry, count of Schwarzenberg, and counsellor of William of Bavaria, sitting at a table, in large folio; an historical portrait of Clement VIII., in an oval; and St. John Capistranus, a monk of the order of St. Francis, both of folio size.

Various Sets.—"The Creation of the World," commencing with the forming of the sun and moon, and ending with the exile of Adam and Eve from Paradise, in a set of eight, after Crispin Vanden Broeck; a set of six, containing the history of Adam and Eve, and Cain and Abel, after Michael Coxie; sixteen subjects from the book of Genesis, with Latin verses, from Martin de Vos; "The Life

LOW COUNTRIES, ENGRAVERS OF THE.

Life of Christ," from the same painter; a set of hermits, engraven conjointly by the two Sadelers, from the same painter. This set is much esteemed, partly on account of the romantic variety of the back-ground landscapes. A set of twelve landscapes of the months of the year, from P. Steevens; "The four Parts of the Day," after Theod. Bernard; "The four Seasons," with Latin verses, after H. Bol, all of folio dimensions.

Historical Subjects.—"The Virgin and holy Infant asleep, and an Angel," from Carracci, in 4to.; "The Feast of Dives," after Bassan; "Jesus at the House of Martha;" and "Jesus with the two Disciples at Emmaus." These three prints are commonly known among collectors by the appellation of "Sadeler's Kitchens." "The Angel appearing to the Shepherds," a night-piece; three plates of "The Nativity," treated in different ways, all of folio size, from Bassan, and a fourth of the same subject from Polidore de Caravaggio, in large folio; "St. Jerome praying, in his Cell, before an Image of the Virgin;" "Mary Magdalen praying in a Cell," both very fine engravings, after Giles Mostaert; "The patriarchal Family of Enoch," in a very fine landscape; "St. Roch and his Dog, with two Pilgrims," both in folio, from the same painter; "Jesus calling little Children," in large folio, from J. de Winghe; "Bacchus seated on a Tub, accompanied by Love and Music;" "St. Paul at Corinth, at the House of Aquila," all in large folio, from the same master; "The Annunciation," from Pietro Candido; "The three Mariæ at the Sepulchre;" and "St. Mary the Egyptian," all in 4to.; "The Last Supper," in folio; "The Virgin and Infant Christ, worshipped by St. Stephen and St. Lawrence," in large folio, all after Candido; "The Martyrdom of St. Ursula," in large folio, from the same painter; "The Nativity," after Hans von Achen, in 4to.; "The Death of our Saviour;" "The Virgin and Infant Jesus, with the Magdalen kissing his Feet, behind them is St. Joseph," both in 4to.; "The Virgin and Infant Christ seated on a Throne, with the two St. Johns and Angels," in folio, after the same painter; "A Repose during the Flight into Egypt," from Christopher Schwarz, in folio; "The Crucifixion," with the Virgin and St. John at the foot of the cross; "The Passion of our Saviour," in seven large folio plates; "The Last Judgment," in large folio, a very capital print; "A Courtesan sitting by a Fountain, playing the Lute, wishing to attract the Attention of a Youth, whom a Sage is conducting another way," in folio, all from Schwarz; "The penitent Magdalen," from Frederic Sustris, in folio; "Jesus appearing to the Magdalen as a Gardener," in folio; "The Annunciation," in 4to.; a whimsical composition of "A holy Family," with angels in the air, carrying the materials for the church of Jesuits at Munich, in folio; "Hercules between Vice and Virtue, with Jupiter in the Clouds," in large folio, all from Sustris; "The good Shepherd," from H. Bol; "The mercenary Shepherd," from the same; "The four Seasons;" a landscape, where three herons are introduced in the air, from Paul Bril; "The four Seasons," from Bol; a pair of landscapes, and a mountainous landscape, with a castle on a rock, all after Bril, in folio; "Man surprised by the Advent of the Deluge," and "Man surprised by the Arrival of the Day of Judgment," a companion to the former, both from Th. Bernard, in large folio, two of the most celebrated and best engravings by this artist; "The Son of God sitting at the right Hand of his Father, in the Clouds, attended by the Holy Ghost, the Archangel Michael, and other Angels," after a picture by Antonio-Maria Viani at Munich,

a very fine and rare print; and "A View of the City of Venice and Bucentaure," both in large folio.

Raphael Sadeler the elder, was born at Brussels in the year 1555, and was the younger brother of John. Like him, Raphael was originally a *Damasquinier* of iron and steel, a profession which is now become obsolete; and like him, travelled through Germany to Italy for his improvement in art, and finally settled at Venice.

Whether Raphael followed John, or the brother, accompanied each other to Italy, is uncertain; but he continued to reside at Venice, having a joint share, as is believed, with his brother, in a commercial establishment there, till the time of his death, which happened in the year 1616.

When he was about the middle period of life, it was found that his application to engraving had weakened his sight; jaunting, he thought, required less optical exertion, and in this art he sought and found refuge, till the strength of his eye-sight returning, he resumed the graver.

With his success as a painter, we are not acquainted. His engravings greatly resemble those of his brother; he understood the human figure exceedingly well; his extremities are in general skilfully marked, and his historical heads are characteristic and expressive. His portraits too, of which he executed several, possess a considerable share of merit.

The Sadelers, John and Raphael, often worked in conjunction, and produced a great number of plates. Separate portraits of them of quarto dimensions, were engraved and published by Cornelius Waumans, with French inscriptions beneath.

Of the engravings of Raphael, the following, generally speaking, will be found most worthy of selection.

Portraits.—Paulus V. Pont. Max. in small folio; St. Charles Borromeus, cardinal, in folio; Ernest, archbishop of Cologne, in folio; Leopold of Austria, bishop of Salzburg, and Passau, after H. Kessl, in 4to.; Leopold, archduke of Austria, bishop of Ratibon, in folio; John Dietmar, abbé of Furlenberg, in folio; Hypolyte, Guarinonius, Dr. of Medicine, in 4to.; Philip de Monte, musical director to the emperor Rodolph II., in 8vo.; Ferdinand, archduke of Austria, in a 4to. oval; and Charles-Emanuel, duke of Savoy, on horseback; after John Carrara, in large folio.

Historical, from various Masters.—Four subjects from the Life of the Holy Virgin; 1. The Salutation. 2. The Visitation. 3. The Marriage. 4. The household Management of the Virgin, in 12mo. A set of twenty-eight from the Life and Passion of our Saviour, in 12mo.; "Mary Magdalen at the Sepulchre, with Sts. John and Peter," after Jod. de Winghe, in 4to.; the voluptuous life of Sardanapalus, surrounded by his women, in 4to.; "Lot and his Daughters," in a fine landscape, in large folio, both after the same painter; "A Holy Family," consisting of the Virgin and Child, Elizabeth introducing the infant St. John, St. Joseph reading, an angel, and two half figures, in folio, from Hans von Achen; "The Entombing of Christ," in an oval, of folio size; "Two Angels in the Sepulchre, with the Body of our Saviour," in folio; "The Resurrection," inscribed "Christi de morte triumphus," a circular print, in folio; (these three prints are very much esteemed;) "The Magdalen in a Cell," with a cross in her hand, reading a book, supported by a skull, in 4to.; "Love caressing the Mutes of Painting and Music," in 4to.; "The Judgment of Paris," a grand composition, all after Von Achen, in folio; "The Nativity of our Saviour," after Matth. Kager, in 4to.; "St. Cunégonde, attesting his Innocence;" and "St. Elizabeth relieving the Poor," both in folio, and from the same painter; "The Virgin and Child," with St. Joseph,

and two angels presenting fruit, in small folio; a half figure of the Virgin, with the holy infant on a cushion, in 4to.; "The Virgin and Child crowned," in folio, both after Candidus; "St. Francis," (in the back-ground is a figure prostrate before a crucifix,) in folio; and "The Immaculate Conception," both in folio, and after Candidus; "The Virgin seated under a Canopy," presenting the infant Christ to a high-priest, accompanied by many other figures, in large folio, from the same painter; "The Resurrection of Lazarus," after J. Rotenhamer, in folio; "The Marriage of St. Catherine," in a landscape, from Henry Goltzius, in folio; "God appearing to Cain, after the Murder of Abel," from M. de Vos; "The Dead Christ," attended by the three Marias, St. John, and two angels holding torches, after Stradan; "Venus, Bacchus, and Ceres," inscribed "Sine Cerere et Baccho friget Venus. Gil. Coignet inv.," "The Uncertainty of Life," exemplified by Death seizing a lady at a grand repast, after Stradan; "Christ on the Cross, attended by St. John and the two Marias," from the younger Palma, all of folio size; "The Virgin suckling the Infant Jesus," surrounded by a garland of flowers, in 4to. from Carracci; "A Holy Family," where the infant Jesus has one knee on his cradle, and the other on his mother's lap, while St. John presents him a little cross: the back-ground presents a mountainous landscape, in folio, from Raphael. A fine circular print of "The Annunciation," a poetical composition, after F. Zuccaro, in folio; "The Adoration of the Kings," in folio, after Bassan; "Jesus at Table with the Pilgrims to Emmaus," after the same painter; a female milking a cow, and giving drink to a little boy, in folio, known by the appellation of "The Little Milk-woman," in folio; "The Four Seasons," in folio, engraved by Raphael in conjunction with his brother John, all from Bassan; "The Four Seasons," after J. Stradan, in folio. Six landscapes, ornamented with rocks, wood, and water, after P. Steevens, in 4to. Two wild landscapes, after Matth. Bril, in folio. Four landscapes, with the history of the good Samaritan, in folio, from P. Bril. Four landscapes from the same painter, in folio. Another set of four, after the same. A set of six emblematical figures, inscribed "Amor," "Nuptia," "Labor," "Honor," "Arma," and "Venatio," after Martyn de Vos. A set of four allegorical subjects, on the four temperaments of man, in folio, from de Vos. A set of faints, entitled "Bavaria sancta," and "Bavaria pia," in folio, after Matth. Kager, engraved by Raphael the elder, and his son of that name. And "The Battle of Prague," engraved on eight plates, in folio, extremely rare, and marked with the name of Raphael Sadeler.

Egidius, or Giles Sadeler, was born at Antwerp A.D. 1570, and died at Prague in 1629. He was the nephew and disciple of the two preceding artists, and following their steps, travelled through Germany and Italy, residing awhile in those cities where art flourished, for his improvement.

He was afterwards invited to Prague by the emperor Rodolphus II. who gave him a pension, which was afterwards continued by his successors, the emperors Matthias and Ferdinand II. He handled the graver with more facility, taste, and freedom than his uncles, and represented the textures of his objects with more feeling than had hitherto been displayed, unless by the very first artists of the German school.

He treated portraits and historical subjects in a broad free style, and harmonized and opposed his lights and shadows in so judicious a manner, that it produced forcible effect, without blackness.

He generally drew correctly, but in the subjects he engraved after Spranger, the contours of his figures, in conformity with the extravagant style of that master's design, are overcharged; he excelled both in portrait and landscape; and was called by his contemporaries the phoenix of engraving. The following remarks from the pen of Watelet, which he intended should be applied to the whole family, are more particularly applicable to Giles. "It is astonishing the success with which the Sadelers have engraved landscape with the graver; the old trunks of trees have all the freedom of the pencil, and playfulness of etching; and it is impossible to represent, in any better way, falls of water, rocks, and the depths of forests: the various weeds and plants which are introduced on the fore-grounds are extremely like nature, and the buildings and back-grounds are executed with so much taste, that it represses our regret for the discouragement of etching." From the numerous engravings of this master, the following will be found worthy of selection.

Portraits.—Burekhard de Berliching, privy-counsellor of the emperor Rodolphus II.; Christophler Guarinonius Fontanus, physician to the emperor Rodolphus, a very excellent and rare print; John George Gualdamm, juris consult; Joachim Huber, counsellor; Jacob Chimarrheus, grand almoner to the emperor; the cardinal of Dietrichstein, bishop of Olmutz; Otto de Starchedel, counsellor to the elector of Saxony, all of quarto size; William Angelle, plenipotentiary to Henry IV., in folio; John Matthew Warenfels, counsellor; Adam, baron of Trautmanndorf; Siegfried de Kolonitsch; Ferdinand de Kolonitsch; the three ambassadors from the sophi of Persia to the emperor Rodolphus, viz. Mehti Kuli, Beg Sinal Chaen, and Cuchein Ollibeg, all in folio; Torquatus Tasso, a very rare print, in 4to.; Octavius Strada, antiquary, in 4to, rare; Peter Breughel, the elder, in folio; Martin de Vos; Sigismund Bathori, prince of Transylvania; Michael Voivode of Walachia, in an oval; Charles de Longueval, count of Buquoi, all in folio; bust of the emperor Matthias, surrounded with allegorical figures and inscriptions; a pair of the emperor Matthias, a three-quarter figure, and its companion, the empress Anne, both in large folio; a large upright print of the emperor Rodolphus on horseback; the emperor Ferdinand II. on horseback, with various emblematical figures and inscriptions, in two large plates, joined; an allegorical subject on the marriage of the emperor Ferdinand with Eleanor of Mantua, in folio; and an allegorical subject on the protection given to the fine arts by the emperor Rodolphus, a very fine print, in large folio.

Subjects from his own Compositions.—A set of twelve, of angels with the instruments of the passion of our Saviour, in small 4to.; a set of four, of the Evangelists, in 4to.; a set of fifty-two views in Rome, entitled "Vestigi delle Antichita di Roma," in folio; a landscape and figures, a rare print, in 8vo.; "The Burning of Troy," an etching in 4to.; a building with niches, introducing the four seasons; "Charity," with three children, both in folio; "Narcissus admiring himself in a Fountain," in large folio; "Pan and Syrinx preparing to bathe," in folio; "St. Sebastian dying, with the Angel extracting the Arrows from his Side," in large folio; "St. Dominic receiving the Institutions of his Order;" "St. Peter and St. Paul;" "The Scourging of Christ;" "The Crucifixion," all in large folio; and a grand composition of "The Hall of Prague," on two plates, a very capital engraving.

Historical, &c. after various Masters.—"The holy Virgin suckling the Infant Christ," from a picture by Raphael, in the Florentine Gallery, known by the appellation of "Ma-

donna della Segiola;" "The Angel appearing to the Shepherds," after Bassan, in folio; "St. Christopher bearing the Infant Christ on his Shoulder," in folio; "The Murder of the Innocents," in large folio, from Tintoretto; "The Call of St. Peter," after F. Barroccio; "Christ carried to the Tomb," a fine print, arched at the top, from the same painter; "The Scourging of Christ," from Joseph d'Anpinas; "The Martyrdom of St. Sebastian," after the younger Palma; "The rich Man in Hell, and the poor one in Heaven," from the same painter; "Angelica and Medora," writing on the bark of a tree, from Carlo Calari, all in large folio; "Etielavonia," a young female, elegantly apparelled, from Titian, in folio; an allegorical print on the death of the wife of Spranger, accompanied with a medallion; "The three Maries going to the Sepulchre;" "The Arts and Sciences triumphing over Ignorance and Barbarism;" "Hercules and Omphale;" "Venus and Cupid," all in large folio, after Spranger; "The Annunciation," after de Wit, in large folio; "Reward," a winged figure standing on a globe, inscribed "Deus omne Dat;" an obelisk with the armour of the count of Mansfeld, inscribed "Sum Umbra Alarum Aquilæ," both in large folio; two busts of angels, after Albert Durer; two fine heads of youths; "The Virgin and Child," in a landscape, surrounded by animals; in the back-ground is introduced the Annunciation of the Shepherds, engraved with great delicacy; "Christ bearing the Cross," all after Albert Durer, in folio; "Judith with the Head of Holofernes," from H. von Achem; "The Adoration of the Shepherds;" "The Virgin and holy Infant, caressing the little St. John," all in folio, from the same painter; "Minerva introducing Painting to the Muses," a grand composition, in the taste of Spranger, in large folio, from Ab. Ach; and four subjects from the Life of the Virgin, *viz.* "The Annunciation," "The Visitation," "The Circumcision," and "The Assumption," after J. Speccard, in folio.

Landscapes.—A set of fifteen, from John (commonly called Velvet) Brughel, in folio, in which are introduced, 1. St. Jerome before a crucifix. 2. A repose during the flight into Egypt. 3. Tobit with the angel. 4. Our Saviour tempted in the wilderness. 5. St. Francis stigmatised. 6. A fish-market on the sea-coast. 7. A view of a gulf, with company on the shore. 8. A stage-coach driving. 9. A windmill and village on the banks of a river. 10. A company of gypsies. 11. A stone and a wooden bridge, with two pilgrims. 12. Two travellers, one of whom is reposing. 13. A woody landscape. 14. Soldiers descending a mountain. 15. A ferry-boat.

Various, from Paul Brill, in folio—A mountainous landscape, into which is introduced a repose during the flight into Egypt; "A Hermit reading in his Cell," in a landscape; two bridges of wood and stone; a mountainous landscape, ornamented with cattle and figures; six views in Italy, with buildings and cattle; six landscapes, into which are introduced the twelve months of the year, very capital engravings.

Landscapes from Roland Savery.—A set of six views in Bohemia, with mills, water, and wood, in small 4to.; another set of six, in Bohemia, with cataracts, travellers, &c. in small folio; another set of six: 1. Villagers regaling under a trellis-arbour. 2. Bandogs on the banks of a canal. 3. A stag-hunt. 4. Labourers on the top of a mountain. 5. A guard-herd reposing near a cascade. And, 6. A warren, in folio. A set of five grand landscapes, from the mountains of Tyrol, in folio, with cataracts, figures, &c.; and two others, of rock and forest scenery, also from the mountains of Tyrol.

From Pietro Stephani.—A set of four rich landscapes, of the seasons, in large folio; a set of eight fine landscapes, with wind-mills, figures, &c. in large folio; and another set of twelve, in folio, of the months of the year.

Of the same family, but of merit somewhat inferior, were Jooſt or Juſtus, Philip, and Raphael Sadeler the younger, who were severally instructed by their parents, and worked mechanically in the same style, merely multiplying the number of prints, without advancing in the smallest degree the general claims or capabilities of their art.

Juſtus was the son of John, and his best performances are certain portraits of the family of Gonzague, and an odd fort of Dutch "Holy Family," from Rottenhamer, wherein the holy Virgin is represented swaddling the infant Saviour, while an angel is strangely busied in warming his linen.

Raphael Sadeler, the younger, was the son of the Raphael whom we have mentioned above, and occasionally assisted his father in his profession, particularly in engraving the set of Bavarian saints. He also engraved "Venus and Adonis," a small upright, from Titian, and "The four Evangelists," from P. Candidus, with other devotional subjects.

Philip was the degenerate son of Giles. A Mark Sadeler has also been mentioned, but is believed to have been only the publisher of the works of his more ingenious relations.

Among the caprices of fortune in his biography, it has been the fortune of some who have benefited mankind, to have their merits pass unrecorded. Von Londerſel, on the contrary, though not of first-rate talent, has been celebrated under two names, both by Papillon and by Strutt.

He appears to have been a native of Holland, born about the middle of the sixteenth century, and to have been chiefly engaged in the execution of letter-press engravings, in a neat and delicate style, resembling that of Virgil Solis, and which are marked sometimes with one and at other times with the other of the two monograms, which will be found in *Plate II.* of those of the school of the Low Countries.

It is not unlikely that these two marks may have given rise to the separation of his works into those of Ahasuerus Landſeld, and Ahasuerus Londerſel. That he was related to the John Von Londerſel, of whom we shall treat hereafter, is highly probable. From the smallness of his productions, of which the greater number adorn the books that were published at Antwerp about this period; he is classed among the little matters, but his engraving of "The Last Supper" is on a somewhat larger scale.

Among the books which he thus decorated, are the 4to. edition, in the French language, of "The Travels of Nicholas de Nicolay into Turkey," printed at Antwerp in 1576, and the large Herbal of Matthias de Lobel. Detached subjects from the holy scriptures are sometimes to be met with, which probably belong to a bible, in which Londerſel at least assisted in the production of the engravings.

Charles de Mallery was born at Antwerp A. D. 1576; it is not known of whom he learned the rudiments of drawing and engraving, but from the great resemblance his style bears to that of the two Wierixes, it is probable he studied in their school. He was a very laborious artist, and engraved a great number of devotional subjects, animals, and book ornaments.

He worked with the graver only, and so exceedingly neat, that he, in some instances, equalled the most laboured performances of Jerom and Anthony Wierix. But then he did not draw so correctly, so that with inferior powers as an artist, he seems to have possessed the fine share of patience and attention, and manual skill. He had the honour of having his portrait twice painted by Vandyke, both were successful pictures, and the prints after them by Verelstam and Momm.

Morin, are well known. In the collection of the abbe Marolles were three hundred and forty-three of the engravings of Mallery; among the best of which may be mentioned "The Adoration of the Kings," in 12mo; "The youthful Saviour," in a landscape, accompanied by two angels; "The Canaanitish Woman;" "A Crucifix," held by a man surrounded with allegorical figures; "St. Francis;" and "St. Jacintha," in 12mo.; "The Holy Family," accompanied by a Magdalen, in 4to.; "Christ among the Doctors," in 12mo.; various heads of Christ, the Virgin Mary, the apostles, saints, &c. Some of the plates, for the great hunts by Stradan, which were produced in conjunction with the Galles, Collaerts, &c. in 4to. The history of the silk worms (which were brought by two monks into Europe), on six middling-sized plates, lengthways, from J. Stradan, entitled "Vermis Sericus;" a bust of "St. Anthony," in an historical border, after Stradan; the fable of "The Man, his Son, and his Afs, going to the Fair," in four 4to. plates; and various plates of horses, for a book entitled "De la Cavalerie Françoise," in 4to., from the same painter.

Having already treated of the education and general merits as an artist of Paul Bril, of Antwerp, who performed some spirited etchings of landscape scenery about the period now under our review, it remains but to mention such of his etchings as are held in most request among connoisseurs. These are all of folio dimensions, and are known by the following designations: a pair of views in the Campania of Italy, with rocky fore-grounds, adorned with buildings, &c. dated 1590; another pair, inscribed "Paulus Bril inv. et fec. Vicenzo Cenoformis Romæ;" another view in the Campania, of the upright form; four landscapes belonging to a set, of which the remainder are engraved by Nieulandt. Sandrart mentions also a large and grand engraving by this artist, of which the subject is a view in the Campo Vaccino. For further information respecting this artist, see the article BRIL in our fifth volume.

Christopher Van Sichem was born in Holland in the year 1580, and resided chiefly at Amsterdam. He was instructed in the principles of engraving by Goltzius, from whom he copied some good portraits. The merit of his engravings on copper, consists principally in the neatness of their executions, but those on wood, after his master, are engraved in a bold style, and often possess a good effect, though he wanted taste. His monogram will be found in our second plate of those used by the engravers of the Low Countries.

The most considerable work he executed is intitled "Iconia Hæresiarum," &c. It consists of a great number of small upright plates, of the principal reformers of the church, is engraved from his own designs, and was published at Amsterdam in 1609.

On Copper.—A profile of Johannes Calvinus Nouioduni, holding a book, surrounded with an historical border; David Georgius Delphis, in Batavia, perniciosissima sectæ auctor; Durch Christop Von Sichem, *Formschneider* und *Kupffstecher* (i. e. cutter of wood, and engraver of copper); Rob. Dudley, Leycestricæ comes; Francis Valesius, dux Alençon; the emperor Charles V. in the imperial costume, inscribed "Carolus quintus Imperator Cæsar Augustus;" and queen Elizabeth, in regal attire; all of quarto dimensions. The two latter portraits have been by some attributed to Charles Van Sichem. Christopher also engraved the whole-length portraits of the earls of Holland and Zealand, in folio, from drawings by himself.

On Wood.—A set of twelve historical subjects, in 12mo. rare; "Elihu before King Ahazuerus," in 4to. from Lucas of Leyden: "The Adoration of the Shepherds," after Ab.

Bloemart; "The Circumcision," after H. Goltzius; "Judith with the Head of Holofernes," all in 4to.; "St. Cecilia playing on the Organ," and four other figures singing; bust of a man, with a hat and feathers, all from the same painter; bust of an African prince, with a helmet ornamented with diamonds and feathers, from J. Matham; a set of four, representing Judith, Sifera, David, and Sampson, from H. Goltzius; and a set of four, representing the Evangelists, with a history of their lives in Dutch; very meritorious prints: all the latter are of folio dimensions.

The baron Heinneken mentions two other Dutch engravers of the name of Van Sichem (*viz.* Cornelius and Charles); and Papillon and Baffan, the latter copying and magnifying the error of the former, has given ideal existence to a third.

Cornelius is often confounded with Christopher, but was of inferior talent. He was of the same family, and flourished about forty years afterwards.

Of laborious industry, and as if pleasureable stimuli rarely reached his mind, he scraped together not fewer than 600 subjects of figures of holy personages, scripture histories, and legendary tales, which he engraved in a stiff and heavy style, but many of them were copies from prints.

Charles was also of the same family, and engraved both on copper and on wood, but his prints merit not much attention. Their several monograms will be found in *Plate II.*

Jacques de Gheyn, or Ghein, the elder, was born at Antwerp in the year 1565, and died in 1615. He learned the elements of painting of his father, who was a painter on glass; and engraving he studied under Henry Goltzius. He successfully imitated the manner of his master, and worked with the graver only, in a bold free style, which manifests the great command he had of that instrument. He drew correctly and frequently with much taste; but all his works want effect, from the lights being scattered, and too equally powerful; neither are the masses of shadow sufficiently broad, nor well harmonized. The number of his engravings amount to one hundred and seventy. He likewise painted flowers and small figures with considerable ability. The monogram of this artist will be found in *Plate II.* of those used by the engravers of the Low Countries. Among his works the following are most worthy of notice.

Portraits.—Tycho Brahe, the celebrated Danish astronomer; Abraham Gokevius, a famous antiquary of Amsterdam; Hugo Grotius, the still more famous philosopher; and Philip de Marne, a distinguished Calvinistic reformer, all in 8vo.; Cosmo de Medicis, who is here called "The Father of his People," a circular print; Sigismond Malatesta, a military officer; and Joannes Basilowitsch, auto-crator of Russia, all in 4to.

Subjects from his own Compositions.—"Vanity," represented by a female figure at her toilet; "Mary Magdalen," a small oval; two small medallions of Mars and Venus; "A Gipsy telling a young Woman her Fortune," in folio; "The Statue of Laocoon and his Sons," in large folio; "A Lion couchant," with a landscape back-ground, a very rare oval print, in folio. A set of ten, very rare and celebrated prints, in small folio, of Masques. The twelve first Roman emperors, a set of circular prints in quarto, very much sought after; "The Sabbath, or Rendezvous of Sorcerers and Sorceresses;" a large folio print, engraved on two plates.

Subjects after various Painters.—The Passion of our Saviour, a set of fourteen, engraved in conjunction with his pupil Zechariah Dolendo, after Van Mander, in octavo; "The Twelve Sons of Israel," half-length figures, after Karl van Mander, in quarto; two emblematical subjects,

LOW COUNTRIES, ENGRAVERS OF THE.

on the folly of those people who spend their time and money in pursuit of pleasure, on two large plates; "The Erection of Babel, and Confusion of Languages," in large folio; "The Adoration of the Trinity," in folio; "The Judgment of Midas," in large folio; "The Prodigal Son," a very fine print, in large folio all from Karl van Mander; "The Crucifixion," a grand composition; and "The Apple of Discord thrown among the Gods," both in large folio, and after Vanden Broeck. A set of four, in circles, of the Evangelists, after H. Goltzius, in quarto; "The Empire of Neptune," a circular print, in folio, after Guil. Telchio. A set of twelve, reckoned among the very best of the engravings of our artist, of the guards of the emperor Rodolphus II. after Henry Goltzius; "The Annunciation," after Abr. Bloemart; "A Repose during the Flight into Egypt," in a circle; "Christ preaching to the Multitude;" and "The Miracle of the Loaves and Fishes," (of the oval form,) are all in folio, and after the same master; "Daniel in the Lion's Den," and "Diana changing Actæon to a Stag," after Th. Bernard, in folio; and "Polyphemus, Æcis, and Galatea," in still larger folio, after Cornelius de Harlem.

Jacques de Ghein, the younger, was of the same family with the preceding artist, and was born at Antwerp in the year 1610. He travelled to Italy, and, as is supposed, became the disciple of Antonio Tempesta, whose style of etching he imitated with no small success: he sometimes worked in conjunction with Coryn Boel, and marked his prints with his name at length, sometimes with the addition of "Ju ior."

Among his works may be mentioned with distinction, the portraits of Francis I. at the battle of Pavia, after A. Tempesta; and that of the emperor Charles V. on horseback, accompanied by his general officers, at the battle of Mühlberg, both in folio. He also engraved, in concert with Coryn Boel, the plates for "The Life of the Emperor Charles V." after Tempesta.

Guil aume de Ghein was also a native of the Low Countries, but of what part is uncertain, and was born some time about the year 1610. Presumptively he was of the same family with Jacques. He travelled to Paris and studied there, or, at least, practised engraving, under J. de Blou, for whom he engraved two, viz. "Spring," and "Summer," of the four seasons, personified somewhat ridiculously, by female figures attired in the French costume of the age of Louis XIII. Here also he engraved the portrait of Louis XIV. when a youth; he is represented on horseback, and attired for the chase; and that of the duke Bernard, of Weymar, also on horseback; both are of large folio dimensions, and engraved in a style which bears strong resemblance to that of Abraham Bosse.

Louis de Vadder was born at Brussels in the year 1560. He was the student of Nature alone: at least he has acknowledged no other instructor, and no other has been recorded; and painted and etched landscape with much ability: he was particularly successful in his representations of Morning, and often introduced the rising sun dissipating the dark vapours of Night, and tinging the tops of the mountains, and other lofty objects, with golden lustre. His style of etching is spirited and free, much resembling that of Van Uden; and among his best prints will be found a small village scene. The same scene, with falconers preparing to set forth on their morning's diversion; and a folio landscape, with the effect of a storm; which, in addition to the name of Vadder, bears that of Vorstermans; from which circumstance it may be presumed that the latter artist either

assisted in etching it, or worked upon the plate afterwards with the graver.

Gilbert van Veen, or Vænius, was born at Leyden in the year 1566, and died at Antwerp in 1628. He was the brother of Otho Vænius, a celebrated painter of portraits and history, who was the instructor of Rubens.

Gilbert worked with the graver only, in a style greatly resembling that of Cornelius Cort; and from the number of engravings that he produced after the Italian masters, it has been inferred that he travelled with Otho into Italy. His engravings are slight, but his outline is good; his heads expressive, and his hands and feet marked in a style that shews the soundness of his knowledge, and, as Strutt says, does him honour.

In the year 1612, we find him living at Antwerp, where, in the course of that year, he published "The Emblems of Horace," after his brother's designs; and shortly after, a set of plates, of which the subjects are taken by Otho, from the "Life of St. Thomas Aquinas," a meritorious work, engraved under the influence of a superintending simplicity, perfectly homogeneous with the style of his brother's designs, and which shewed that they were brothers in mind, as well as by consanguinity.

The principal works of this artist are the *Portraits* of Ernest, duke of Bavaria, in a medallion, supported by Fame; John of Bologna, and Alexander Farnese, after Otho Vænius, surrounded with allegorical figures, all of folio size.

Of his *Historical Works* may be mentioned, "The Emblems of Horace," in quarto; "The Emblems of divine and profane Love;" and "The Life of St. Thomas Aquinas," all after Otho Vænius; "The Four Seasons," from Raphael del Colle, in folio; "The Marriage of Isaac and Rebecca," in a frieze, composed of five folio plates, after Balth. Peruzzi, a very rare and capital work; "The Visitation of St. Elizabeth," in folio, from Baroccio; and "Our Saviour crucified, attended by the Virgin and St. John," in large folio, after the same master.

Bartholomew Dolendo was born at Leyden A.D. 1566, and became the disciple of Henry Goltzius. He worked entirely with the graver in an open style, somewhat resembling the slighter works of his master, but was much his inferior, both as an engraver and draftsman; yet it is said, that Gerard Douw learned the first principles of drawing from Dolendo.

He marked his engravings with one or other of the cyphers which may be seen in *Plate II.* of those used by the engravers of the Low Countries, and his most esteemed productions are "The Prophet Jonas thrown into the Sea," which is companion to "The Prophet Jonas asleep under his Gourd," in circles; "A Dutch Village Fete," in quarto; "Adam and Eve receiving the forbidden Fruit," after Karl van Mander, in quarto; "Jesus appearing to Mary Magdalen as a Gardener," in folio, from his own composition; "The Holy Family," and "St. John preaching in the Desert," both in folio, after M. Coxie; "Pyramus and Thisbe," after C. vanden Broeck, in quarto; "Jupiter and Ceres," after B. Spranger, in large folio; and "The Assumption of the Holy Virgin," also in large folio.

Zachariah Dolendo was born at Leyden in the year 1567, he was related to the preceding artist, and learned the elements of his art of Jacques de Ghein. He drew correctly, and was, in no respect, inferior to his master. We have, by his hand, a number of portraits which are equal to those of

LOW COUNTRIES, ENGRAVERS OF THE.

Wierix; his monogram will be found in *Plate II.* of those used by the Low Country engravers.

From his works we shall select the following, as being most worthy of esteem:—William, prince of Orange, a half-length figure in armour, in a quarto oval, and finely engraved; "Andromeda chained to a Rock," from his own composition; "The Virgin seated on a Throne, crowned by two Angels," after Jac. de Gheyn, both of quarto size; "The Crucifixion," in large folio, from the same painter; "Adam embracing Eve, whilst she receives the Apple from the Serpent," after Spranger; "St. Martin dividing his Mantle between two Beggars," from the same painter, in quarto; "The Continuance of Scipio," a circular print, from Ab. Bloemaert, both in quarto; and a set of "The Heathen Gods and Goddesses," from H. Goltzius. His naked Andromeda is a well-drawn figure, with the head and extremities marked in a masterly style. Of the two Dolendos, who were probably brothers, it may safely be asserted, that Zachariah was the superior artist. The time of his death has escaped notice: if that of his birth has been truly registered by Huber, he could have been only in his fourteenth year (which is scarcely credible) when he produced his excellent portrait of prince William of Orange, for the print bears the date of 1581.

The family of Bloemaert attained a justly founded celebrity as engravers, during the period which is now under our review: for an account of them the reader is referred to the article BLOEMAERT, in our fourth volume.

James Matham was born at Haerlem in the year 1571. As we have already stated, he became the son-in-law and pupil of Henry Goltzius, in consequence of his widowed mother marrying that distinguished artist during the adolescence of James. Advised, no doubt, by his tutors, he travelled to Italy to complete his studies, and in that country produced a considerable number of engravings: yet after his return he continued to work under the eye and the direction of Goltzius, and though he produced many valuable prints, they possess little originality as engravings, being executed in the style, or rather, in the manner of his father-in-law, whom, however, Matham never equalled in correctness of outline, or in taste, or in the science which enabled Goltzius to adapt his powers to the several occasions which called them forth. In short, though his manual command of the graver, which was the sole instrument of his art, evinced extraordinary skill, yet, like most imitators, in seizing the grosser part of the art of Goltzius, he let the essence escape. His numerous engravings, however, have been valued by most collectors, and are principally as follows.

Portraits.—A bust of Philip Winghius, after H. Goltzius, in octavo; a bust of T'leest al van den Velde, in an historical border, in quarto; and Nicolas Bulius, also in quarto; Abraham Bloemaert, in folio, after Paul Morelles; Michael Angelo Buonarroti, in folio; Philip William, prince of Orange, after Mirevelt; and Henry of Nassau, prince of Orange, both in large folio.

After various Italian Masters.—"The Statue of Moses," a sitting figure, after Michael Angelo; and the "Statue of Christ," from the same master, both in folio; "A Holy Family," where the Virgin is represented carrying the infant Christ, accompanied by St. Anne, after the picture of Raphael, which was presented to Charles II. of England, by the republic of Holland; "Mount Parnassus, with Apollo, the Muses, and the Poets," both in large folio; "A Holy Family," accompanied by St. Catherine, after Titian, in folio; "The Alliance of Venus, Ceres, and

Bacchus," from the same painter; "The Visitation of the Virgin," a rich composition, after F. Salviati, in large folio; "The Saviour's Feet anointed," a circular print, after Thaddeus Zuccaro; "Christ on the Mount of Olives," both in folio; "The Nativity," and "The Assumption of the Virgin," grand compositions from the same painter, in very large folio; "The Adoration of the Kings;" "Christ healing the Sick;" "The Resurrection of the Widow's Son," all grand compositions, after Zuccaro, of large folio size; and "The Visitation," after P. Veronese, a circular print, also in large folio.

Various subjects, after Goltzius.—"The Fall of our First Parents;" "The Holy Family," with St. Elizabeth; "Christ on the Cross," at the foot of which is St. John and the Virgin; "Christ appearing to the Magdalen, in the Garden," all of folio dimensions; "Jesus at Table with his Disciples at Emmaus;" "St. Luke painting the Virgin," in large folio; "Venus requesting Cupid to aim an Arrow at Pluto," in quarto; "The Loves of the Gods," viz. 1. Jupiter and Europa. 2. Phœbus and Leucothoe. 3. Mars and Venus. And 4. Hercules and Dejanira, engraved as a set; "The four Seasons," in circles; "The three Christian Virtues," Faith, Hope, and Charity, all in folio; "The seven Cardinal Virtues," in quarto; and "The Seven mortal Sins," in folio; "The Picture of Cebes," or "The Type of Human Life," a very large composition, engraved on three plates, in a very fine style.

Historical, after various Painters.—"Abraham dismissing Hagar," in folio; "The Annunciation," in half figures; "The Adoration of the Shepherds," all in folio; "The Parable of the Sower," with a landscape back-ground, in large folio; "The Virgin in a Glory," and her head surrounded with seven stars, the crown of immortality, in folio; "St. Veronica and St. Saviour, with two Angels," in large folio; "St. Stephen kneeling;" "The Loves of Jupiter and Danaë;" and "The Loves of Cupid and Psyche," all in folio, from Ab. Bloemaert; "Samson asleep on the Lap of Dalilah," after Rubens, in large folio; "The Holy Women, weeping over the dead Body of Christ," after Jer. Franck, in folio; "The Crucifixion," after Albert Durer, known by the appellation of "The Grand Calvary à l'accolade," large and rare; "Venus asleep, surprised by Satyrs," after Rottenhamer, in quarto; and a set of five very rare prints, after Peter Van Aertsen, (called by the French Peter the Long); namely, 1. The Poulterer and Fruiterer. 2. Six Women and a Man, surrounded with Provisions of all kinds. 3. The Kitchen of the wicked rich Man. 4. Jesus and his Disciples, in the Kitchen at Emmaus. And 5. The Toaster; of which set it is very difficult to meet with good impressions.

Theodore Matham was the son and pupil of the preceding artist, and was born at Haerlem in the year 1600. He travelled into Italy, where he studied in the school of Cornelius Bloemaert, and in conjunction with him, Persyn, Natalis, and other artists, he engraved the statues of the Justinian palace. He did not work with the graver only, but sometimes made use of the point; most of his works consist of portraits, many of which are executed in a manner which does honour to the artist; among his works we shall mention the following as being most worthy of the notice of the collector.

Portraits.—Michael le Blon, agent of the queen of Sweden, after Vandyke; Joost van de Vondel, a Dutch poet, after Sandrart; Jodocus Larenus, a reforming minister; Vopiscus Fortunatus Plempius, doctor of medicine; D. Gerardus Vossius, Canonius Cantuariensis, after Sandrart; Caspar

Caspar Barlaeus, doctor of medicine; four fine portraits, after John Spilberg; viz. 1. Philip William, count palatine of the Rhine; 2. Wolfgang William, count palatine; 3. Catherine de Medicis, and 4. Stephen Vacht, dean of Sarten; Claude Saumaize, after Dubordieu; Henricus Regius, Philos. et Med. from H. Bloemaert, all of folio size; and D. Leonardus Marius Grezanus, in large folio, from Moyart.

Historical, &c.—"The Virgin and Child, with St. John," after Bassan; for the collection of engravings from the pictures in the cabinet of M. Reynot; "A Holy Family," a grand composition, after Joachim Sandrart, in large folio; "Sainte Begga, the Daughter of Pessin, duke of Brabant," from Van Eyck, in folio; "Actæon metamorphosed into a Stag," in folio; "The Body of Christ, taken from the Cross by St. John and Joseph of Arimathea," a very large plate; and "The Allegory of Virgil," from Joost van Vondel, in quarto.

Adrian Matham was also of Haerlem, related to Theodore and James, and born some time about the beginning of the seventeenth century, but he was, on the whole, inferior to those artists in merit. He worked with the graver only, imitating the elder de Gheyn, but was always behind him, nor can it be necessary to dwell on his demerits.

He engraved part of the plates for the large folio volume, which was published at Antwerp in 1628, and entitled "Academie del'Espée;" "The Golden Age," from Goltzius, in large folio; "An old Man presenting his Purse to a young Female," (a large upright) from the same master; "A Group of itinerant Musicians," after A. Vander Venne, in folio; "A Combat between six grotesque figures, with culinary Implements," from the same painter: his other works are less worthy of notice.

He also engraved portraits, among the best of which are those of Pieter Bor Christiaensz, a Dutch historian, after Frank Hals; and D. Sibrandus Sixtius Oostervirius, after N. Moyart, both in folio.

Herman Muller was a native of Holland, but we know not the precise time or place of his birth. If he frequented the school of Henry Goltzius, which appears very doubtful, though it is asserted by Strutt, it must have been before the peculiar style of that artist was formed, and consequently before his migration to Italy. He worked in conjunction with Cornelius Cort, in the earlier part of the career of that artist, for Jerome Cock. The sole instrument of his art was the graver, which he handled with tolerable precision, but not much freedom; and in his best works his drawing is performed with care. In his later works, he aimed at the bold and free style of Goltzius, which had by this time excited the surprise of most of his contemporaries and the admiration of some, but in this endeavour our artist was not very successful.

His engravings are numerous and not uncommon; they are marked with one or other of the three monograms, for which see our *Plate II.* of those used by the engravers of the Netherlands. Among them may be distinguished "The three Destinies," and "Cleopatra," after Cornelius de Harlem; "Lucretia," after C. Kettel, (an upright) "St. Cecilia," in which plate it may be seen he has attempted to embolden his style. A set of four of "The Cardinal Virtues," after Martin Hemskerck; another set of "The six Commandments of God," illustrated by subjects from bible history, from the designs of the same painter, and some other bible subjects which range in sets, with certain works from the gravers of the Sadeliers and Galles, from J. Stradan and M. de Vos, of various folio dimensions.

John Muller, of the same family, was an artist of more vigorous powers. He was born in the year 1570, as is supposed at Amsterdam, but how he stood related to Herman is not known. His vigour, however, as an artist, was not wisely employed, like that of an Hercules; but rather extravagantly lavished; he swaggered like a giant of romance. Studying under Henry Goltzius at his worst period, he learned to exceed even his excesses. He caught the enthusiasm of that great artist, but fell short of him in judgment and variety. "The modesty of Nature," was with Muller as with Spranger, entirely out of the question, and the more he could "Out-herod Herod" in his manual execution and style of design, (especially when engraving after Bartholomew Spranger,) the better he appears to have pleased himself.

Hence some of his extravagancies are scarcely less ludicrous than others are seriously surprising. Watelet says of him, that "he handled the graver with the greatest freedom, and will ever be worthy of the attention of those artists who wish to distinguish themselves in the mechanical part of engraving; but they must learn to subdue the audacity of his style. It is very difficult to employ less work than Muller, in rendering the textures of objects, and he always worked his plates up to a good tone. He understood the human figure well, but from engraving much after Adrian van Vries and Bartholomew Spranger, acquired a mannered habit of drawing, which particularly discovered itself in his hands and feet."

To this estimate of his merits, Strutt adds, "the facility with which he handled the graver, for he worked with that instrument only, cannot be sufficiently expressed; his works must be seen to convey a proper idea of it to the mind, yet if in freedom of execution he equalled his master, in every other requisite he fell far short of him," &c.

That Solomon Muller was of the same family with Herman and John, as Strutt has conjectured, appears very doubtful, if not altogether an error. He sometimes wrote his name Miller, and is so utterly destitute of the talent and enthusiasm of the Mullers, that he appears, from his small Bible prints, which were produced about the period now under our review, rather to have copied the worst of the Wierixes, with equal neatness, but with deeper dulness.

Of the engravings of John Muller, the most distinguished are the

Portraits of Bartholomew Spranger, a kindred spirit, whom Muller terms, in the inscription beneath, "M. Pictor celeberrimus," it is dated in 1597, is in folio, and after Joab ab Ach; Everhardus Reidanus, comitis Guilhelmi Nassavoy Consiliarius; Maurice, prince of Orange; John Neyen, of Antwerp, laying his hand on a skull; Ambrose Spinola, the celebrated general, in large folio, both from Mirevelt; Christian IV., king of Denmark, from Ifacks; Albert, archduke of Austria, from Rubens, and its companion, Isabella, infant of Spain, from the same painter, in large folio.

Subjects from his own Compositions.—"The Baptism of Christ, celebrated in Heaven," in folio; "An Ecce Homo," surrounded by angels, a circular plate, in large folio; "Balthasar's Feast," and "The Adoration of the Kings," two very capital plates, in large folio, very much sought after by connoisseurs; "Chilo, the Spartan Philosopher," and "Harpocrates, the God of Silence;" two heads as large as life, engraved in a very bold, vigorous style.

Subjects from various Masters.—"Hagar in the Desert, comforted by an Angel," in quarto; "Lot and his Daughters,"

ters," in large folio, almost square; "The Nativity," with eight Latin verses, in large folio; "The Holy Family," attended by two angels, in folio; "A young Hero, conducted by Hercules and Scipio to the Temple of Glory," in quarto; "Venus attended by Nymphs and Satyrs," in folio; "A Satyr dressing the wounded Foot of a young Fawn," in quarto; "Venus and Mercury," with four Latin verses, in folio; "Ceres, Bacchus, and Venus, before a Fire," in large folio; "Mercury and Minerva arming Perseus," a very fine engraving, in large folio; "The Goddess Bellona," engraved on two large plates, and dedicated to the archduke Matthias; "Psyche contemplating Cupid asleep," in large folio, all from B. Spranger; "The Resurrection of Lazarus," after Ab. Bloemart, a very capital print; "The Murder of Abel," after Cornelius of Haerlem; "The Discomfiture of Irus, before the Suitors of Penelope," in large folio; "Arion mounted on a Dolphin," in large folio; "Fortune distributing her Gifts," a large and grand composition, engraved on two plates, all from Cornelius of Haerlem; "The Martyrdom of St. Sebastian," after Jean von Achen; a very large engraving, performed on three plates, of "The Rape of the Sabines," from a composition in wax by Adrian van Uries; "Mercury and Pandora," in large folio, from a group in bronze, by the same extravagant artist; and a set of seven circular plates, entitled "The Works of Creation," after Henry Goltzius.

Paul Moreelse, or Moreelsen, was born at Utrecht in the year 1571, and died in the same city in 1638. He studied painting under Michael Mirevelt, whom he soon equalled, and succeeded in portraits, historical subjects, and architecture; the latter is sufficiently testified by the gate of St. Catherine, in the city of Utrecht, which was built from his design. He studied during some time in Italy, and we have by him some excellent wood cuts in chiaroscuro, executed on three blocks; the first for the outline, which is cut in a very spirited style; the second for the dark shadows; and the last for the demitints. These prints have a light airy appearance, the hatchings by this artist being performed with great delicacy. They are drawn in a slight, but masterly manner, and the union of the several tints produces an agreeable effect. He usually marked his plates with a monogram, which will be found in our second plate of those used by the engravers of the Low Countries.

Of the engravings on copper by this artist we are only able to specify the two following, which are both in folio. "Cupid with several dancing Figures," and "The Death of Lucretia."

John Saenredam was born at Leyden in the year 1570. He studied the elements of engraving successively under Henry Goltzius and James de Gheyn. Possessed by the insatiation in favour of clear and sleek lines, which was fashionable at the time, he appears never to have resorted to etching, but executed his plates, which are somewhat numerous, with the graver alone. He handled that instrument, however, with great facility, and his style is at once free, clear, neat, soft, and delicate, but his chiaroscuro is deficient in vigour.

He appears to have understood drawing better than he always practised it, as may be seen by comparing the plates which he has engraved after his own compositions, with those which he has executed after pictures by other masters. The outlines in the former are generally much more correct, and they are for that reason sought after by connoisseurs with more anxiety.

Some of his prints are large. Their number is estimated by Florent le Comte at one hundred and thirty-two, which

they probably somewhat exceed; among them we shall mention the following as being most worthy of the notice of the collector. The artist usually affixed to them one or other of the two monograms, given in our second plate of those used by the engravers of the Netherlands.

Portraits.—Carl van Manden, after Goltzius, in quarto; John Césarér, painter and philosopher, a rare print, in folio; John de la Chambre, writing master, after Franc. Hals; and Peter Hogebert Hornanus, a poet and physician, surrounded with allegorical figures, after C. van Manden, both in folio.

Subjects from his own Compositions.—"Sufannah and the Elders," a small oval; "Deborah standing at the Foot of a Rock," perhaps singing or meditating her celebrated canticle, in folio; "Hercules, between Minerva and Venus," a folio print, nearly square; "Lycurgus giving Laws to the Spartans," and exemplifying the advantages of good education, from the habits of two dogs, in folio; "The wife and foolish Virgins," on five plates, with nine Latin verses; very capital, and executed in so delicate a style, that the plate soon wore under the hand of the printer, and it is therefore difficult to meet with a good impression; in folio. A large allegorical subject, relating to the government of the seven United Provinces under the house of Orange, represented by a procession attended by Concord and other political virtues, in large folio. Another allegorical subject, relating to the government of the Low Countries by the infant Isabella. That princess herself is represented standing under a tree on the right hand. Both very rare prints. And a representation of a large whale, which was thrown upon the coast of Holland, with thirty-two Latin verses; a very fine and rare print.

Subjects after various Painters.—"The Fall of our first Parents," in quarto, after Henry Goltzius; "Lot and his two Daughters," in folio; "Judith with the Head of Holofernes;" "Sufannah surprised by the Elders;" The six penitent women of the New Testament, viz. 1. Mary Magdalen. 2. The Woman of Samaria. 3. The Woman of Cana. 4. The Woman taken in Adultery. 5. The Woman with the Hemorrhoids. And 6. The paralytic Woman: with Latin explanations; in quarto. A set of three, 1. Ceres, worshipped by Labourers; 2. Venus, worshipped by Lovers; and 3. Bacchus, worshipped by Drinkers, in large folio; very fine and rare prints. "The Union of Ceres, Bacchus, and Venus," in folio; "Venus and Cupid," in quarto; "Diana, with her Nymphs," in a set of three plates, each containing two figures; "Diana discovering the Incontinence of Calisto;" "Andromeda delivered by Perseus;" "The Five Senses," in quarto; "The Seven Planets;" the three marriages, viz. "The Marriage for Interest;" "The Marriage for Passion," and "The Marriage of true Affection," in quarto; a painter drawing the portrait of a female kneeling before a mirror, known by the name of "The Painter," in folio; all from Henry Goltzius. "The Life of Adam and Eve," after Abr. Bloemart, on six plates, in folio. The history of the prophets Elisha and Elijah, four folio plates. "Elijah with the Widow of Sarepta;" "The Annunciation of the Shepherds," both in large folio; "The Prodigal Son," with a landscape background, in folio; "Vertumnus and Pomona," and "The Rape of Ganymede," both in large folio; all from Abraham Bloemart. "Mars and Venus," with four Latin verses, from P. Isaacs, in quarto; "The Bath of Diana," from Moreelsen, commonly called "The Great Bath of Diana," to distinguish it from the former one after the composition of Saenredam himself; "Judith putting the Head of Holofernes in a Bag held by her Servant," in folio, from Lucas

LOW COUNTRIES, ENGRAVERS OF THE.

of Leyden; "Deborah nailing the Head of Sifera," in folio, from the same painter; "The Meeting of Eleazar and Rebecca," after Carl van Mander, in large folio; "David with the Head of Goliath" on his sword, from Lucas of Leyden; "The Daughter of Herodias dancing at the Festival of Herod," after C. van Mander; "The Nativity," a grand composition; and "Paul and Barnabas refusing the Sacrifice of the Inhabitants of Lystra," a grand composition, all in large folio, after the same painter; "Adam and Eve in the terrestrial Paradise," in folio, from Cornelius of Haerlem; "Sufannah and the Elders;" "St. John preaching in the Wilderness;" "Paris and Oenone cutting their Names on the Bark of a Tree;" "Angelica and Medora engraving their Names on a Beech Tree;" "Vertumnus and Pomona;" all in folio, from the same painter. "The Grotto of Plato," a celebrated parable, shewing that most mortals prefer darkness to light, with twelve Latin verses, from C. of Haerlem, in large folio; a very fine print, both in composition and execution. A wounded general, carried by his soldiers, formerly supposed to be Scipio, but as the costume of the figures is Grecian, and not Roman, it is more probably "The Death of Epaminondas;" it is engraved after a drawing by Goltzius. "The Redemption of Rome by the Dictator Camillus," after a drawing by Goltzius; both of folio size. In the latter print, the characters of the Romans and Gauls are finely contrasted. A set of eight folio plates, dedicated to the duke of Aquepart, of "The History of the Unfortunate Niobe and her Children," from the drawings of Goltzius after Caravaggio; with Latin verses, very rare. The pictures form a frieze in the palace of Buffal, at Rome. "The Entombing of Our Saviour," after Michael Angelo; and "Our Saviour at the House of Levi the Publican;" executed on five plates, from the pictures of Paul Veronese in the church of St. Paul at Rome, of large folio size, and very rare.

Peter Serwouters, or Sherwouter, was born at Antwerp in the year 1574, where he always resided. He worked in a clear neat style with the graver only, but without much taste. His plates are not sufficiently finished to produce a pleasing effect, nor accurate enough to bear critical examination.

From among his works, which are not numerous, the following may be distinguished as least unworthy of the notice of the collector. A set of ten subjects of Chafes, after D. Vinckenbooms, in small folio, lengthways; "The Fall of our first Parents," of which the artists of the Netherlands appear to have thought their countrymen could not be too often reminded. In the present instance, French and Dutch verses lend their aid in impressing the religious lesson, and the whole forms a large folio print. "Sampson killing the Lion;" "David killing the Bear;" and an emblematical plate, representing in the front a Dutch merry-making, with figures dancing, and a cottage in the back-ground, from the door of which a man and his wife are issuing forth to oppose a man with a drawn sword; all in folio, from the same painter. Serwouters also engraved part of the plates for Thibault's "Academie de l'Espée," in folio, published at Antwerp A. D. 1628. The monogram which this artist sometimes affixed to his prints will be found in *Plate III.* of those used by the engravers of the Low Countries.

John von Londerfeel was born at Bruges in the year 1550. He worked entirely with the graver, in a stiff dry style, greatly resembling that of Nicholas de Bruin, whose disciple he probably was. However, his prints are not without some share of merit; and are sought after by connoisseurs.

He marked his plates in various ways, sometimes with his initials, combined as in our *Plate IV.* of the monograms, &c.

used by the engravers of the Low Countries, or, at other times, J. Lond. or J. Londer fec. Among his works, we shall select the following as being most worthy of the attention of the collector. The theological virtues, Faith, Hope, and Charity, personified by female figures, with a landscape back-ground; the Five Senses characterized by figures, seated in a landscape, both in large folio, and apparently from his own designs. A woody landscape with hunters; and one with the fable of Apollo and Daphne, both in folio, from Jac. Savery; "The disobedient Prophet devoured by a Lion;" "Tobit journeying with the Angel;" "Jacob tending the Flocks of Laban," with landscape back-grounds; "St. John in the Wilderness," all in large folio, and after G. Hondecoter; "The good Samaritan;" "The blind Warrior;" "The Woman with the Hemorrhage;" and "Abraham sacrificing Isaac," all after Giles Coninxloo. A perspective view of the interior of the church of St. John de Lateran at Rome, after Hendrick Arts, (a painter with whose name we are otherwise unacquainted) The following are all after D. Vinckenbooms; "Saul anointed King of the Hebrews;" "The Rape of Tamar;" "The Prophet foretelling to Jeroboam the Division of his Kingdom;" "Sufannah surprised by the Elders;" "The Temptation in the Wilderness;" "The Saviour praying on the Mount of Olives;" "The Maries approaching the Holy Sepulchre;" "Diana and Actæon;" and "The Pleasures of Summer." The latter is a meritorious landscape, and they are all of large folio sizes.

John Barra, or Barra, was a native of Holland, born A. D. 1572. He emigrated to England, and in the year 1624 was residing in London. His slender talents, however, merit not much attention. His instrument was the graver, and that only: his *work* may be truly so termed, being entirely without the vivaciousness of art, and characterized by all the tameness and coldness of manual labour, in which respect the worst imitator of the worst of the Sadelers did not outdo him.

Of the engravings of Barra, it may be quite sufficient to mention the

Portraits of prince Maurice of Nassau and Orange; Charles II., elector of Saxony; Joachim, count of Ortemberg; and Lodovicus, duke of Richmond and Lenox, the latter of which was engraved in this country.

Historical Subjects, &c.—"Phaeton's fatal Request to Apollo," introduced in a landscape, of folio size. Four other landscapes in quarto, in which are introduced the pilgrims to Emmaus, and different events in the history of Tobit. Two historical landscapes from the story of "Sufanna and the Elders;" "The Parable of the Sower;" "Herodias receiving the Head of John the Baptist," all in quarto. The last subject is from J. van Achen. "Time and Truth" is from Paulus ab Elstatis, and is a small upright, as is also "Bathsheba at the Bath."

Nicholas, or Claus Coeck, is scarcely more worthy of notice than him whom we have just dismissed. He was of Leyden, born in the year 1576, and, according to the baron Heineken, studied under Frank Floris, though his engraving appears rather to contradict this, and to point to Cornelius Cort as his master.

Of his works, which are not numerous, it may be sufficient to name "The Four Elements," personified by half-length figures, and "The Judgment of Midas," all after Carl van Mander, and of folio dimensions.

Gisbert van Breen, or Van Brecht, was born in Holland some time about the year 1576. He worked entirely with the graver, and is supposed to have been the disciple of

James de Gheyn. His engravings are not destitute of merit, though inferior to those of his master.

From among them the connoisseur may with advantage select the *Portraits* of James I. of England, his queen, and the young prince of Wales, on the same (folio,) plate. A set of six small prints of "The Life of a Libertine," presumptively from his own compositions. "The Marketers with Fowls and Eggs," after Claes Coeck; "Envy stripping the Clothes from the Back of a Lady," after the same author, both in small folio. A satirical print, wherein certain persons are busily employed in washing an angry jack-ass. A pair, in the first of which two young libertines are dissipating their wealth, and in the second are reduced to want and misery, in quarto, and after Van Mander. An instrumental concert, after Sbrassen. A set of small friezes of sea-ports, with shipping, &c. after C. Nicolai.

Whether the Nicholas, or Claus, Braen or Breen, who is mentioned by Baffan, was related to the preceding artist, we know not. They have by some writers been confounded together; but Nicholas appears to have been of the school of Saenredam, and was the author of a set of four ovals from compositions by himself, of which the subjects are, Samson, Sisera, Judith, and David, (David is here the stripping, and bears the head of Goliath). He also engraved "A Penitent Magdalen," after James Matham, in folio; and "Christ conducted to Calvary," also in folio, and after Tintoretto.

William van Swanenbourg, or Swanenburch, was born at Leyden in the year 1581. He was the disciple of Saenredam, and did honour to his master and himself, by the freedom and vigour of his engraving. Abram Bosse recommends his prints to students in the art, on account of the beauty of his touch: yet it must be confessed that the drawing of Swanenbourg is mannered and defective; and if students should imitate, where it is applicable, the boldness of his handling, and his dexterity of touch, they should aspire to purer delineations of form.

He affixed to his engravings a monogram, for which, see *Plate II.* of those used by the engravers of the Netherlands.

We shall specify the following prints from the graver of Swanenbourg, as being most worthy of the attention of the connoisseur.

Portraits.—Abraham Bloemart, in an ornamented border; Janus Hautenus, secretary of Leyden, both in 4to.; Daniel Heinsius, professor of Leyden; John Heurnius, doctor of medicine at Leyden; John William, duke of Cleve; Maurice, prince of Orange and Nassau; Ernest Casimir, count of Nassau, from P. Moreelsen, in large folio; and Petrus Jeannius, eques, hanc maximi viri effigiem ex vultu expressit Michael Mirevelt, &c. in folio.

Historical, &c. after various Painters.—"Jacob defrauding his Brother out of Isaac's Blessing;" and "The Resurrection of Our Saviour," both from P. Moreelsen, in large folio. A rustic festival at the entrance of a village, after Vinckenbooms, in large folio. "The Judgment of Paris," from M. Mirevelt; "Perseus rescuing Andromeda," after Saenredam, in folio; "The Adoration of the Shepherds," after Abr. Bloemart, in small folio; "The Six Penitents," in folio, viz. Saul, St. Peter, St. Paul, Zaccheus, Judas Iscariot, and the Magdalen. "St. Jerome in the Wilderness;" "The Repentance of St. Peter." Three subjects emblematical of Piety, Riches, and Vanity, in small folio, all from Bloemart. "Lot and his Daughters;" and "Jesus at Table with the Pilgrims at Emmaus," both from Rubens; and a set of fourteen, commencing by "Jesus Christ carrying the Cross," and ending with "The Last

Judgment," entitled "Thronus Justiciæ. Hoc est optimus Justiciæ tractatus electissimis quibusque exemplis judiciariis aeri incisus illustratus. Joachim Uytenwacl, pinx. G. Swanenburch, sculp. 1605, 1606."

Cornelius Boel was born at Antwerp in the year 1576. He was of the same family with Peter Boel, the eminent painter of animals and flowers, but studied engraving apparently in the school of the Sadeliers. He made little use of any other instrument than the graver, which he handled with ability in a clear and neat style.

Boel engraved a set of small oval plates for the fables of Otho Vænius, which were inscribed with Latin, English, and Italian verses, and published at Antwerp in 1608. "The Last Judgment," from a composition by himself, in small folio, and the portrait of Henry, prince of Wales, in an ornamented border, and of quarto size.

From this latter plate, and the inscription beneath the frontispiece to the large folio Bible, which was published here by royal authority in the year 1611, which inscription runs, "C. Boel fecit, in Richmond;" it is inferred that our artist visited England about the middle period of his life. But his principal and great work was a set of eight large plates, from Antonio Tempesta, of which the subjects are "The Battles of Charles V. with Francis I."

The family of Hondius or de Hondt was numerous, and some of them of distinguished merit in the arts. Joll, or Jodocus, was the son of Oliver Hondius, a very ingenious artist of Ghent, where, in the year 1563, our artist was born, and where he passed his youth in the successful study of some branches of the mathematics; but the intestine commotions which agitated that city, about the period that Jell attained the age of manhood, occasioned him to seek refuge in England.

Here he followed various pursuits, as various occasions called forth and developed the variety of his talents. He made mathematical instruments, fabricated types for letter-press printing, and engraved maps and charts. Here also he married in the year 1586, and had several children. He afterwards removed to Amsterdam, and died there A.D. 1611.

Jodocus also engraved a few portraits, which are neatly executed, though in other respects their intrinsic merit is not considerable: among them are the celebrated English navigators, Thomas Cavendish and Sir Francis Drake. The latter is a large plate, and is commended by Strutt.

From an artist, however, so variously employed as Hondius was, no man expects exquisite engravings; the place of his residence being England, and the time, the close of the sixteenth and the commencement of the seventeenth centuries. He sometimes marked his plates with the cypher, which may be seen in *Plate III.* of those of the engravers of the Low Countries; and at others, with a bound barking, and inscribed "sub cane vigilante;" which bound is, in fact, a pun upon his family name.

Beside what we have mentioned above, Jodocus engraved the charts for Drake's Voyages, and several of the maps for Speed's Collections, in large folio, which latter are in general embellished with figures; and Florent le Comte mentions, among the works of this engraver, a large perspective view of London, published at Amsterdam in 1620; but Strutt very reasonably infers a mistake either in the engraver's name, or the date of this print.

Henry Hondius the elder, so called in contradistinction to him of whom we shall speak hereafter, was born at Dussel in Brabant, A.D. 1576, and died at the Hague in 1610. Whether he was the son or brother of Jodocus has been disputed, but is not known.

LOW COUNTRIES, ENGRAVERS OF THE.

He appears to have studied in the school, and to have contracted the stiffness of Jerome Wierix, but possesses not his correctness. His principal engravings are the

Portraits of Cornelius Cort, Henry de Cleve, Giles Coninxloo, and Hans Holbein, (all painters;) John Bugenhagen, Philip Melancthon, John Wickliffe, John Knox, John Calvin, and Jerome Savonarole, (celebrated reformers,) all in 4to.

Historical, &c.—"The Judgment of Solomon," and "The Woman taken in Adultery," both after Carl von Mander; "A Flemish Recreation;" a set of five engravings, representing the celebration of St. John's day, at Menlebeck, near Brussels, by healing the sick, both from P. Breughel the droll; and "Mularum Officia," or the Muses giving a concert on mount Parnassus, an agreeable composition, though the expression of the heads is rather common, after Th. Zuccherro, all of folio dimensions.

Henry Hondius the younger is, with better reason than Henry the elder, believed to have been the son of Jodocus, and to have been born in London.—according to Huber.—in 1580, which is unfortunately four years before,—according to Strutt,—his father was married. He is supposed by Strutt to have studied under his father, and to have applied himself with diligence to the art of engraving. His prints are neat, but discover little art.

Beside finishing some plates which had been begun by Jodocus, the following are enumerated among his works.

Portraits of Bernard, duke of Saxe Weimar, in folio; a large head of queen Elizabeth; James I. of England, dated 1608; William, prince of Orange, after Alex. Cooper, dated 1641; Ferdinand, emperor of Germany, in 4to., dated 1634; and sir Francis Drake, in folio.

Landscapes, historical Subjects, &c.—A set of the four seasons, after Paul Brill, dated 1643; another set of the four seasons, consisting of landscapes, adorned with various architecture, after P. Stephan, both in folio; a set of twelve landscapes of the months of the year, in which are introduced seasonable occupations and diversions, in large folio; two prints representing drunken peasants, with landscape back-grounds; two grotesque subjects of fools, &c. both after P. Breughel; "Christ going to Emmaus;" and "The Shipwreck of St. Paul," a companion to the former, both from Giles Mostert, all of folio size; "Tobit fishing, attended by an Angel;" "St. John the Baptist preaching in the Wilderness;" and a view of the Hague, a rare print, all from Giles de Saen, in large folio.

The younger Henry visited Holland about the time of his arrival at manhood, or a little before, and resided at the Hague. Here he engraved the view of that town, which we have mentioned above; and here, in the year 1600, was born his son William or Guillaume Hondius.

William acquired the rudiments of engraving under his paternal roof; from whence he removed to Dantzic, and to the Hague, and became distinguished by the merit of his portraits, of which he engraved a considerable number.

His cypher may be seen in *Plate III.* of those of the engravers of the Low Countries; and his most remarkable portraits are those of himself, after Vandyke, with the addition of "Chalcographus Hagæ Comitis;" Francis Frank the younger, painter of Antwerp, after the same master, both in folio; prince Maurice of Austria, an excellent print, probably from a drawing by Hondius himself; Ladislaus IV. of Poland, inscribed "W. Hondius fecit 1637;" Theodore ab Werden Burgio; Berhard, duke of Saxe Weimar, all presumptively drawn by himself; Henry Cornelius Longkuis, after Mytens; Jean Casimir, king of

Poland; Charles, prince of Poland and bishop of Breslau, both after D. Scultz; and Louisa Maria de Gonzague, queen of Poland, after Juste d'Egmont, bearing the name and addition of "Wilhel Hondius Chalcographus Regius," from which it appears that our artist enjoyed the honour of being engraver to the king of Poland.

Abraham Hondius, the justly celebrated painter of animals, was of the same family with the preceding artists; for whose biography and general merit as an artist, see HONDIIUS, ABRAHAM. He etched a few plates in a slight, spirited, and painter-like style, yet with some degree of neatness, of which the subjects are the huntings of various beasts of chase; these afford very striking examples of animal expression, especially when their passions are roused to fury. His folio prints of "A Boar Hunt," and "The Chase of a Wolf," are, in this respect, admirable works, and are probably his best productions in this mode of art.

With the sixteenth century arose the genius of Rubens, which has gilded the fine art of the Netherlands with unfading glory, and even tinged with its radiance the ethics and theology of Europe. His biography and extraordinary merits as a painter will be treated under the article RUBENS, SIR PETER PAUL. He etched a few plates, of which the merits are not transcendental, though they evince the powerful and free hand of a master; but he effected a revolution in painting, and indeed may be said to have given a new constitution, more essentially free than that which preceded it, to the arts of his country, as our subsequent pages, devoted to the progress of engraving in the Low Countries, will attest.

The etchings of Rubens are performed in a slight and bold style, from his own compositions: "St. Francis d'Assize receiving the Stigmata," in 4to.; "The penitent Magdalen," ditto; "St. Catherine," with the instruments of her martyrdom, &c. designed for a ceiling, and one of the best of the etchings of Rubens, of folio size; "The communication of Light," a small upright: the plate being afterwards finished with the graver, either by Paul Pontius or Lucas Vorsterman, impressions of the etching, as it came from the hand of Rubens, are exceedingly rare and valuable. The composition consists of a boy lighting a candle at another, which is held by an old woman. These, and the portrait of an English minister, a small head, in an oval border, are all the prints with which we are acquainted, proceeding from the etching-needle of this very distinguished master.

With the vigorous and original powers of Rubens, co-operated by the fine taste of Vandyke, and roused by the trumpet that sounded forth their fame, Bolswert, the Vorstermans, and Pontius girded their loins, and leaped forth candidates of high enterprise and extraordinary promise, in the race of historical and portrait engraving.

The best of the engravers of Italy, with Marc Antonio at their head, had added truth of character to exquisite purity of outline. The heroes of the German school, led on by Martin Schoen and Albert Durer, had expressed the textures of the various surfaces or substances which adorn the face of nature, with nice discrimination; and had made some successful approaches toward a vigorous and harmonious chiaro-scuro. It remained for Bolswert, Pontius, and the Vorstermans, the champions of the Netherlands, to possess themselves of their trenches, and complete the circumvallation of engraving; and this they accomplished, aided by the commanding judgment and exquisite taste, and stimulated also by the successful example, of Rubens and Vandyke.

To deeper and richer tones than had heretofore been produced.

LOW COUNTRIES, ENGRAVERS OF THE.

duced, they added a talent of rendering local colour in the abstract, which they possessed and exercised in enviable perfection.

Lucas Vorsterman the elder was born at Antwerp, A.D. 1580, and at first studied painting in the school of Rubens; but, counselled by his master, who had remarked the true bent of his genius, he quitted the pencil for the graver. He greatly distinguished himself as an engraver before he quitted the Low Countries, in particular by the production of his print of "The Adoration of the Eastern Kings," after Rubens; which is pronounced by Huber to be one of the finest engravings that was ever executed, and is indeed a print of transcendent merit. But Vorsterman is of the number of those artists who were attracted to the court of London, by the taste and patronage of Charles I.; and as he contributed largely to the advancement of English engraving, the reader will find such of the subsequent events of his life, as are of importance to art, detailed, and accompanied by a general estimate of his merits, in our account of the *Origin and Progress of English Engraving*. A more copious list of the best works of so distinguished an artist than we were then enabled to offer, is now submitted to the admirers of legitimate engraving.

Lucas commonly signed his plates with a cypher, for which see *Plate III.* of those used by the engravers of the Low Countries.

Portraits after Vandyke.—Peter de Jode; Charles de Mallery; James Callot; Theodore Galle; Wenceslaus Coeberger; Deodatus del Mont; Peter Stevens; John Van Mildert; Hubertus Vanden Eynden; Lucas Van Uden; Cornelius Sachtleven; Horatius Gentilescius; and John Liveus, all distinguished artists, in folio; Isabella Clara Eugenia, infant of Spain; Galton, of France, duke of Orleans, brother to the king of France; Ambrosius Spinola, governor-general of the Low Countries; Wolfgang William, count palatine of the Rhine, and duke of Bavaria; Francis of Moncade, count of Offona; Nicolas Fabricius, of Peirese; Alfonso Perez de Vivero, count of Fuenfalds; Thomas Howard, earl of Arundel, all of folio dimensions; Nicolas Roccoxius, an amateur of Antwerp; one of the finest portraits of Vorsterman, in large folio.

Portraits after various other Masters.—A bust of Plato, after an antique marble; bust of Seneca the philosopher, also after an antique; a pair of Cosmo of Medicis, and Lorenzo of Medicis, in circular borders; pope Leo X., an octagon plate; Justus Lipsius, Iscanus; and Claudius Maugis, abbé of St. Nicholas, from Ph. de Champagne, all of 4to. size; John de Serres, after N. Van der Horst, in 4to.; Constantine Hughes, secretary to the prince of Orange; John Livins, del.; a bust of the emperor Charles V. and the constable of Bourbon, both from Titian, in folio; another of the emperor Charles V., after a copy by Rubens, from Titian; Charles de Longueval, count of Busquoi, after Rubens, a very fine and rare print, in large folio.

Historical, after various Painters.—"The Holy Family," on a black ground (engraved in England), after Raphael; "The Entombing of Christ," and "St. George on Horseback," both from the same painter, in folio; "Christ in the Garden of Olives," after Caracci, in large folio; "The Virgin and Holy Infant," worshipped by two pilgrims, in folio, after Michael Angelo; "The Adoration of the Shepherds," the same subject differently treated; "The Adoration of the Eastern Kings," a very fine and rare print; a repetition of the same subject, all in large folio; "The Holy Family," accompanied by St. Anne; another "Holy Family," where the infant Christ caresses

his mother; "The Virgin and Holy Infant," accompanied by St. John; "Cæsar's Tax, or the Tribute Money," all in folio; "The Descent from the Cross," in large folio; (the best impressions of this plate are inscribed C. Van Merlen); "The Angel appearing to the Holy Women at the Sepulchre of Christ," in folio; "St. Francis receiving the Stigmatics;" "The Martyrdom of St. Lawrence," both in large folio; "Mary Magdalen throwing away her Jewels;" the frontispiece of a book, intitled "A general Ecclesiastical History, from the Birth of Jesus Christ to the Year 1624," in folio, all after Rubens. "The Flagellation of our Saviour," in large folio, after G. Seghers; "The Death of St. Francis," after the same painter; "St. Ignatius of Loyola;" "The Fable of the Satyr and his Guest, who blew hot and cold with the same Breath," after Jac. Jordaens, in large folio; "The Chase of a Bear," after Snyders; and "A Vocal Concert" of six persons, among whom a girl is playing the guitar, after A. Colter, both of folio dimensions.

Contemporary and compeering with the elder Vorsterman, were the Bolsverts. The biography of these was inserted in our fourth volume before our present arrangement in schools was determined on (see BOLSWERT, ADAM, or BOETIUS, and SHELTIUS); but of the works of artists so illustrious, it has been judged proper to add a more copious list for the information of collectors, omitting those which are already before the reader in vol. iv. The monograms with which these artists severally marked their performances, may be seen in our third plate of those used by the engravers of the Low Countries.

Works of Boetius, a Bolsvert.—The portraits of Adam Salsbort, with the motto "Omnia Vanitas;" a pair of ditto of John Bergman, (a celebrated Jesuit,) kneeling before a skull; and St. Aloïse Gonzaga, kneeling before a crucifix, both in folio; Guillaume Louis, comte de Nassau, and (its companion) the corpse of the same nobleman lying in state, dated 1618, and after M. Mirevelt, in folio; a set of seventy-seven small plates, from designs by Bolsvert himself, done to accompany "The Life of Christ;" another set of small book plates, also from his own designs, engraved for a mystical work, entitled "Le Pelerinage."

Historical Subjects after various Masters.—"The Adoration of the Shepherds," after Abr. Bloemart; "A Repose during the Flight into Egypt;" both in large folio. A set of four landscapes, and fourteen plates of animals, in 4to. both from the same maller; "Jesus at the House of Martha and Mary," a rich composition, after J. Goïemar, a very large plate, very much sought after; "Death and Time, conquering Men and Animals," in folio, after D. Vinckenbooms; "Adam and Eve in the terrestrial Paradise," surrounded with animals, a very fine engraving from the same painter. These three prints are very rare, and much sought after by collectors; and "The Judgment of Solomon," a large folio plate, after Rubens.

The most esteemed works of *Sheltius a Bolsvert*, omitting those mentioned in the Cyclopædia, vol. iv. and beginning with his *landscapes*, are as follow:—The landscapes of Sheltius are indeed very surprising performances. When we consider the picturesque ruggedness of his rocks, and boles of trees, and the freedom and looseness of his foliage, it seems scarcely credible that so high a degree of excellence in this department of the art should have been attained by the use of the graver alone; yet in all his landscapes not a line of etching appears. Nor is our wonder less excited when we contemplate the tones, rich or exquisite as the various occasions required, which Bolsvert has here produced, more perfectly vibrating with those of the original pictures:

pictures: we had almost said than those of any other landscape-engraver whatever. But certainly, in this respect, no engraver has surpassed him.

A large landscape, wherein is introduced a lion-hunt, with a cavalier overthrown and another coming to his rescue. This is one of the finest engravings of the whole set. A grand mountainous subject, with romantic falls of water, into which is introduced the effect of a storm, and the fable of the hospitality of Philemon and Baucis towards Jupiter and Mercury. The companion to which is a sea-storm and shipwreck; the fore-ground is occupied by mariners who have escaped the wreck, and are kindling a fire on the shore. (This print is commonly called the "Tempest of Eneas.") A forest-scene, into which is introduced the fable of Meleager and Atalanta; the champaign of Malines, with haymakers; a large landscape, with animals in a stable, and a female filling a pig's-trough with food. (This last, completing the set, is engraved by P. Clouet.) A landscape with ruined edifices, and two women carrying baskets in the fore-ground. Ruins on a plain, with various rustic figures. A landscape, in the fore-ground of which is a wooden bridge, with a shepherd and flock. A champaign country, with two women in the fore-ground, one of whom carries a basket, and the other a rake; a rainbow is represented in the clouds. Sun set, with a man bringing horses to water, and a landscape, with the effect of moon-light.

Devotional Subjects, &c. from his own Designs.—"The Infants Christ and St. John playing with a Lamb;" "The Virgin and Infant asleep;" "The Virgin suckling the Holy Infant;" "A Statue of the Virgin, with her Hands crossed on her Bosom;" all in 2mo. "The Virgin and Child in the Air, attended by Angels and Cherubim;" "The Virgin caressed by the Infant Christ, with St. Joseph." Twelve figures of saints, half-length. Another set of twelve of saints, all in 8vo. "A Hermit prostrate before a Cross;" "The Mother of Grief, piercing her Bosom with a Sword;" "Jesus Christ triumphing over Death;" both in folio. "St. Barbara, a Virgin-Martyr;" "St. Stanislaus Koska, kneeling before an Altar;" "St. Francis Borgia;" "St. Alphonso Rodriguez;" "Robert Bellarmine, at a Bureau;" "Leonard Lessius;" all in large folio. "The resigned Death of a Saint;" and "Dreadful Death of a Sinner," two folio prints. An emblematical subject relating to prince Ferdinand, the governor of the Low Countries, in large folio. "A Thesis," dedicated to Sigismund, king of Poland, on two large plates. The frontispiece, and five other plates for Thibault's Fencing Academy, in large folio, and a rare print, entitled "The Dispute between the Fat and the Lean," in large folio.

Portraits after Sir Anthony Vandyke.—Shelcius a Bollswert; Andrea Van Ertvelt; Martin Pepyn; Adrian Brouwer; and John Baptist Barté; (all distinguished artists;) Justus Lips, an historian; Albert, prince of Aremberg, Barbançon, &c.; Maria Ruten, the wife of Vandyke; Margaret of Lorraine, duchess of Orleans; William de Vos; and Sebastian Vrank; painters, all of folio dimensions.

Historical Subjects after Vandyke.—"Maria Mater Dei, or the Virgin in Extasy," in folio; "The Virgin with the Infant Christ on her Knees, attended by St. John, and an Angel with a Crown," in large folio; "The Virgin contemplating the Infant Christ on her Lap, accompanied by a Saint holding a palm Branch;" "The Virgin seated, with the holy Infant asleep in her Arms, with St. Joseph," both of folio size; another "Holy Family, attended by Angels;" "The Elevation of the Cross on Mount Calvary;" "Christ on the Cross," at the foot of which are St. Dominic and

St. Catherine of Sienna, both in large folio; and "A Drunken Silenus, attended by Bacchanals and Satyrs," in folio.

Historical, after various Masters.—"Christ on the Cross," with St. John and the holy women at the foot, after Jordaens; "Argus lulled to sleep," with Mercury preparing to behead him; "The Infant Jupiter," with a nymph, milking the goat Amalthea, accompanied by a satyr playing the tambourine, both in large folio. The two latter are the finest of Bollswert's engravings after Jac. Jordaens. A family concert, inscribed "Soo D'Oude fongen, Soo pipen de Jongen." "Pan holding a Basket of Fruit, accompanied by Ceres crowned with Wheat, and a Figure blowing the Horn," both in folio, and from Jordaens. Impressions of the latter are become very rare; "The holy Salutation," after Gerard Seghers. "The Return from Egypt," where the Infant Christ appears walking between St. Joseph and the Virgin; "The Virgin appearing to St. Ignatius of Loyola;" "St. Francis Xavier tempted by Satan, and comforted by the Apparition of the Virgin and Child;" "The Denial of St. Peter," in an assemblage of soldiers, playing at cards; and its companion, "The Smokers," two very capital prints in large folio, after G. Seghers; "A Concert," after Theodore Rombout, being the companion to one of the same subject engraved by Vorsterman, after Coeller; "The Virgin and holy Infant," (who holds the globe of the earth,) after Erasmus Quellinus; "The Communion of St. Rose," after the same painter; "The Body of Christ on the Lap of the Virgin," after Diepenbeck; and "The Crucifixion of three Jesuits at Japan," after the same painter, all of large folio dimensions.

Historical, &c. after Rubens.—"The Annunciation," the best impressions of which are marked with the name of Vanden Enden; "The Return from Egypt;" "The Executioner giving the Head of St. John the Baptist to Herodias," in folio; "Christ crucified between the two Thieves," in folio; "A Crucifixion," wherein a soldier is piercing the side of Christ; St. John and the Virgin are standing at the foot of the cross; a very beautiful engraving, executed in a bold style, in large folio; "A Crucifixion," with the city of Jerusalem in the back-ground; and another engraving of the same subject, both in large folio; "The Body of Christ on the Lap of the Virgin, with St. Francis," in large folio; "The Resurrection," and "The Ascension of Christ," two large folio plates; "The Trinity," where Christ is represented dead, a fore-shortened figure supported by the Deity; "The four Evangelists," in large folio; "The Triumph of the Church," a large folio plate nearly square; "The Destruction of Idolatry," a large print lengthways, on two plates; "The Fathers of the Church, surrounding St. Clare, with the Sacraments," a large folio plate nearly square; "The immaculate Conception of the Virgin," a circular print in large folio; another "Assumption of the Virgin," where a disciple raises a stone at the mouth of the sepulchre; "The Virgin embraced by the Infant Christ," "The Infant Christ on a Table caressing his Mother;" "The Virgin, with the holy Infant on her Lap, holding a Globe and Sceptre;" "The Holy Family," where the infants Christ and John are playing with a lamb; and four other engravings of the same subject, in large folio; "St. Francis Xavier standing before a Crucifix," in folio; and its companion "St. Ignatius of Loyola," before the name of Jesus, surrounded with rays of glory; "St. Cecilia playing on the Organ," a distinguished plate, the first impressions of which are inscribed G. Hendrix. Those where the name of Witdoeck is substituted for that of Bollswert are retouched, and of very inferior

rior value. "St. Theresa interceding at the Feet of Christ, for the Souls in Purgatory," in large folio. Nymphs and satyrs laden with fruit and game, half figures, commonly called "The Return from the Chase," in folio. "A drunken Silenus," supported by a satyr, and another figure. The impressions, with the name of Bollwert only, without the address, are the earliest and best. "The Continence of Scipio," in large folio. Those impressions are the best with the name of Hendrix. "A triumphal Arch," in honour of Ferdinand, cardinal-infanta of Spain, and governor of the Low Countries, in large folio, and "Jesus Christ, the two Virgins, four Angels, and many other holy Persons," engraved by S. a Bollwert and Corn. Galle, and inscribed with the name of Hendrix, in folio.

Paul de Pont, or Pontius, the third of our celebrated chalcographic triumvirate of the Netherlands, was born at Antwerp A.D. 1596, and became the disciple of the elder Vorsterman, both master and pupil being at the time befriended and improved by the frequent counsel and advice of Rubens. The best works of Pontius, and which form the basis of his well founded celebrity, are free graphic translations from the originals of that great master, in the accomplishment of which he united precision of touch, with a nice perception of form, character, and expression. His manual power and command of the graver was scarcely inferior to that of his contemporary Bollwert, and if in taste he was inferior to Vorsterman; in a just and even penetrating observation of the peculiar merits of the picture before him, and the principles upon which those excellencies were produced and connected, he was inferior to neither. Care, observation, feeling, were pre-eminently his; and hence the truth and vigour of his historical heads. Genius, and profound knowledge of the human figure, certainly belonged in higher degrees of perfection to Vorsterman and the Bollwerts.

In commenting on the productions of this illustrious triumvirate, a foreign critic of eminence dwells with just emphasis on the neglect and the importance of ascertaining what ought to be esteemed *principle* in engraving, as well as in all other arts that are with propriety so termed; and when we call to mind, and apply the well-founded aphorism of Hippocrates, that "art is long, life short, opportunity fleeting, and even experiment, sometimes fallacious," it may well seem extraordinary that among the critics and connoisseurs of the Low Countries, nothing was done towards ascertaining and publicly explaining the merits of these admirable engravers, and that in any part of Europe, so little has been done in this art toward ascertaining principle at all. The art of the statuary, and the sister art of painting, have been cultivated, and have flourished under the mild and cheering influence of settled laws; their actual progress, as well as occasional retrogradations, are known and understood: while engraving has been doomed to the undetected endurance of the wildest anarchy; of licentious and contradictory practice; and merit, demerit, and mediocrity, have alike had their hour of idle gazing, and have alike fled from that steady critical comment which should have marked the stages of the progress of the art.

Some writers have idly asserted that Rubens occasionally worked on the plates of these artists. The fact is, (as we have reported in our short notice of the etchings of this master), that Rubens had so little pretensions of this kind, indeed was so far from possessing any power over the graver, that the few touches that were wanting after corrosion, to the completion of his plates, were supplied by his friends Vorsterman, Bollwert, or Pontius. The error has origi-

nated from its having been the custom of these artists, for Rubens to revise and touch from time to time upon trial-proofs that were taken to ascertain the engraver's progress: in doing which, as these engravers worked after Rubens and Vandyke, with the freedom and fellow-feeling of friends, not with the servility of slaves, it was sometimes found necessary to vary the chiaroscuro from the original pictures, in order that when the local colours were abstracted, the spectator's perceptive faculties should be impressed or operated upon, in a similar manner, and consequently his mind affected in the same way, as by the combinations of colour with light and shade in the original pictures: for, paradoxical though it may appear, it is clear that these men of genius thought and felt thus upon the subject, nor is it less clear to those who studiously compare the engravings of these masters with Rubens' original pictures, that they were right in so thinking.

The following engravings, from the hand of P. Pontius, are deservedly held in considerable estimation.

Portraits after Vandyke.—Paul Pontius, engraved by himself; Sir Peter Paul Rubens; James de Breuck, architect; John Wildens; John vans Ravellein; Palamede Palamedessen; Theodore Vanloo; Theodore Rombouts; Gerard Honthorst; Henry van Balen; Adrian Stalbert; Gerard Segher; Simon de Vos; Daniel Mytens; Gaspar de Crayes; and Martin Pepyn; all celebrated artists of Antwerp. Gaspar Gevartius, juris-consulte; and Nicholas Rockok, magistrate of Antwerp; John van den Wouwer, counsellor to the king of Spain; Caesar Alexander Scaglia, abbé of Staphard; Gustavus Adolphus, king of Sweden; Mary of Medicis, queen of France; Emmanuel Phocas Perera, count of Feria; Francis Thomas, of Savoy, prince of Carignano; John, count of Nassau, general to the king of Spain; Don Alvarez, marquis of Santa Cruz, and governor of the Low Countries; Don Carlos, of Colonna, (a Spanish general); Don Diego Philip de Gusman, marquis of Leganez, and Spanish general; Mary, princefs d'Arenberg; Henry, count de Berghe; Cornelius van den Geest; and Balthazar Gerbier, minister from the court of Spain to that of England, all of folio dimensions; Frederic Henry, prince of Orange; and Francis Thomas of Savoy, prince of Carignano, both in large folio.

Portraits after Rubens.—Sir Peter Paul Rubens; Gaspar Gevarto, juris-consulte; Ladislaus Sigismund, prince of Poland and Sweden, all in folio; Philip IV. king of Spain; and its companion, Elizabeth of Bourbon, his queen, (the best impressions of these portraits are before the name of G. Hendrix, was inserted); Elizabeth Clara Eugenia, infanta of Spain; Ferdinand, cardinal, infanta of Spain, and governor of the Low Countries; Gaspar Gusman, duke of Olivares, a very fine portrait, done from a copy by Rubens, of a picture of Velasquez, all in large folio; and a set of three, in folio, very fine and rare portraits, of Christoval, marquis of Castell-Rodrigo; Manuel de Moura Cortereal, marquis of the same place; and a Spanish lady, adorned with a necklace of precious stones; the mother of Manuel of Castell-Rodrigo.

Portraits from various other Painters.—Raphael d'Urbino, in the costume of his age; Ambrosius, count of Hornes, after F. de Nys; Abel Servien, count de la Roche des Aubins, and minister plenipotentiary to the court of Munster, after Ans. van Hulle; and John de Heem, a painter of Utrecht, after John Lyvins, all of folio dimensions.

Historical Subjects, after Rubens.—"Susanna surprised by the Elders;" "The Adoration of the Shepherds," (a circular plate,) both in large folio; "The Slaughter of the Innocents,"

Innocents," a very large print, lengthways, on two plates; "The Presentation in the Temple," a fine plate; "Christ bearing his Cross;" an allegorical piece, known by the appellation of "The Christ of the Clenched Fist," because one of the angels who are overthrowing Sin and Death has his fist clenched, a very fine engraving; "The Madre Dolorosa, or Dead Body of Christ on the Lap of the Holy Virgin," and "The Descent of the Holy Ghost, or Miracle of the Cloven Tongues," all of large folio size; "The Holy Spirit subduing the Flesh," (an allegorical subject,) a very rare print, in folio: a large folio print, called "Rubeus's Epitaph," from a picture in the church of St. James, at Antwerp. The subject is a religious allegory, in which Rubens himself appears in the character of St. George. A head of Christ, in an oval, of folio size; "The Assumption," in large folio; "The Coronation of the Virgin," one of the latter engravings of Pontius, in folio; "The Virgin suckling the Infant Jesus," a rare print, in octavo; "The Holy Family," where the Infant Jesus is caressing his mother, half-length figures; "Christ appearing to St. Roch," with "Eris in peste Patronus" inscribed on a banner, a fine print, and engraved from a picture which is esteemed among the very finest of the works of Rubens; a very large and rare engraving, in which real and allegorical personages are oddly associated, à la Rubens, for the sake of complimenting the princes of the house of Austria and the Cordeliers; and a very large upright print, of "The Dispute between Neptune and Minerva," dedicated to pope Urban VIII.

Historical, &c. after various Painters.—"The Flight into Egypt," after Jac. Jordaens, (the best impressions of the engraving are before the name of Bloteling was inserted;) "The Festival of the Kings," after the same painter, a fine engraving; "The Adoration of the Kings," after Gerard Seghers, all in large folio; "The Virgin and Holy Infant, accompanied by St. Anne," in folio; "St. Francis Xavier, prostrate before the Virgin and Child," a circular print; "St. Sebastian, and an Angel drawing an Arrow from his Side," all from G. Seghers; "The Dead Body of Our Saviour on the Lap of the Virgin," or, "Madre Dolorosa," after Vandyke, all in large folio; "St. Hermanus Joseph," from a picture painted for the Jesuits of Antwerp, and now in the royal gallery at Vienna; "St. Rosalia, receiving a Crown from the Infant Jesus," both from the same painter, in folio; "The Holy Family," after John van Hack; and "The Entombing of Christ," after Titian, in large folio.

Of merit very inferior to that of his father, was Lucas Vorsterman the younger: he was born at Antwerp in the year 1600, and learned the elements of engraving under his paternal roof. He also practised the art of drawing portraits from the life. But though he scarcely reached above mediocrity in either art, his productions, of which the following are those most worthy of esteem, are sought after by the curious.

Lucas Vorsterman, the father, from Ant. Vandyke, in folio; "The Virgin Mary," she is represented in the clouds, and surrounded by angels; "Christ crowned with Thorns, and mocked by the Jews," both in quarto, after Vandyke; "The Trinity," after Rubens, in folio; the fable of "The Satyr and his Guest, who blew hot and cold," in large folio, nearly square, after Jacques Jordaens; part of the plates for the large folio "Treatise on Horsemanship," by the duke of Newcastle; several of the plates from the gallery of the archduke Leopold, at Brussels, which were published by David Teniers, the younger: and part of the collection of drawings of Nicholas Lanier,

a musician and amateur of the reign of Charles I. This latter set is, perhaps, the best part of the works of the younger Vorsterman.

Peter Soutman was born at Haerlem in the year 1580, or not long afterward, and became the disciple of Rubens. Beside etching and engraving, he painted both history and portraits with success, and was patronized, not only in Flanders, but also in Germany and Poland.

We have a great number of prints by this artist, both from his own compositions and those of other painters, particularly his great master, Rubens. They are for the most part etched, and with great spirit, not all in the same style, but under the influence of the different notions and feelings which from time to time appeared to have prevailed, as he endeavoured to explore the capabilities of a new art, in which the practice of his predecessors and contemporaries shewed him that there remained much to discover. He is like an early voyager, who sometimes warily coasts the lands which others have touched at before him, and sometimes with better hopes and bolder navigation pushes forth into unknown regions, obscurely guided by the dubious bearings of the headlands which he fancies he has descried. Watelet says his style is, in some instances, contrary to the theory of the art, though as no system of principle was then settled, or is even yet ascertained, he can only mean that in those instances it is opposite to the practice of certain engravers, whose works had obtained the praise of such reputable and established connoisseurs as Watelet himself. He continues, "but his prints always convey an idea of the softness of flesh, and the colouring of the pictures from which they are taken. He engraved in a pure style, with the same merits and faults as I have remarked in his etchings." And Strutt, with perhaps a perception somewhat clearer of Soutman's intentions, informs his readers that "Soutman seems to have aimed at giving a striking effect, by keeping all the masses of light broad and clear; but by carrying this idea too far, almost all his prints have a slight unfinished appearance, though the engraving is, in itself, sufficiently neat. There is the style (of drawing) of the master in the treatment of the heads and other extremities of his figures," &c. &c.

For the sake of not disconnecting those artists who most distinguished themselves by their attainment of that particular merit which most strongly characterises the school of the Netherlands, and who should therefore be contemplated together, we have placed Soutman a little behind his chronological rank; but it should be recollected to his credit, that Vorsterman was his fellow pupil, and that, in all probability, the enterprising prow of our artist, and the beacon he set up, at once stimulated and taught Pontius and the Boffwerts when and where to launch forth, and how to traverse, with least danger, the unfathomed ocean of their art.

Of the engravings of Soutman, it may be sufficient, in this place, to mention the following.

Portraits.—Joannes Wolferdus de Brederod, gener. Marchalcus Belgii confederati; Gerard von Honthorst pinx; the armouries of Orange Nassau, surrounded with trophies and allegorical figures; the frontispiece to the portraits of the counts of Flanders; Soutman pinx. et sculp.; the emperor Adolphus of Nassau; the empress of Ferdinand II., queen of Hungary and Bohemia, both from Van Sompel; John the Intrepid, count of Flanders; and Philip IV. king of Spain and the Indies, all in large folio.

Historical, &c.—"The Fall of the Damned," a large upright, after Rubens, the early impressions of which are known from those subsequently printed, by their having

been taken before the address of the junior Bouttats was inscribed beneath the plate; "The Defeat of the Army of Sennacherib by the exterminating Angel," also after Rubens, and in large folio; "Jesus giving the Keys to St. Peter," from Raphael; "The miraculous Draught of Fishes," from Rubens, all in large folio; "The Last Supper," a very long print, engraved on two plates, from the celebrated picture of Da Vinci, in the refectory of the Dominicans at Milan, engraved through the medium of a drawing by Rubens; "Christ on the Cross," after Rubens, of which plate it is very uncommon to find a good impression; "Christ laid in the Sepulchre." The first impressions of this plate being very faint, Widoock worked afterwards on the plate, to give it more effect. "The Creation of a Bishop," all in folio; "The Rape of Proserpine;" "The Triumph of Venus," in large folio; and "A drunken Silenus," supported by a satyr and a negress, all after Rubens; "The Grand Sultan on Horseback," attended by his principal officers at the head of his army, in folio, from a picture by Soutman himself; a set of four large hunting pieces, namely, the chase of a lion and lionsess, ditto of a wolf, ditto of a boar, and ditto of a crocodile and hippopotamus, engraved on two plates, all after Rubens; "A couchant Venus," after Titian; and "St. Francis kneeling before a Crucifix," from Michael Angelo, both of folio size.

Sneyders was flourishing at this period, and contributed to the advancement of engraving by a book of animals, which he etched with a degree of truth and animation corresponding with what we behold with so much pleasure in his pictures. His etchings consist, we believe, of sixteen plates, which are not all of the same dimensions. For the biography of this extraordinary artist, see the article SNEYDERS, FRANCIS.

John Vredisman Frisius was born at Leuwarde in the year 1527. He was an architect of some talent, as well as an engraver; and is the designer of the arch erected at Antwerp, in honour of the triumphal entry of Charles V. and his son. The principal engravings of the elder Frisius are contained in a book of sepulchral monuments, which are presumptively from his own designs. The work was published at Antwerp, A.D. 1563. His style consists of a coarse and heavy mixture of etching, with the work of the graver.

Related to the above artist were John Eillart Frisius and Simon Frisius: the former is the author of some few portraits, among which are those of Henry IV. of France, and Henry of Nassau, prince of Orange; both of which are folio dimensions.

But Simon Frisius was an artist of abilities very superior to those of his relatives. He was born at Leuwarde in Friesland, A.D. 1580, and learned the rudiments of engraving of Eillart, or of Vredisman. He handled the etching-needle with great taste and facility; and his etchings are now become rare, and are much sought after. Abram Bosse says, "Simon Frisius handled the point with great freedom, and his hatchings possess the firmness and neatness of engraving." He adds, (what we do not very well understand,) that "this artist made use of a soft kind of varnish, such as is used by refiners in the separation of metals."

He sometimes subscribed his plates with "F. fecit;" and at others, with his initials "S. F.:" and his best prints are a set of heads of the sybils and saints, in 4to., from his own designs; a set of portraits, after H. Hondius, in small folio; a large collection of folio landscapes, after Matthew Brill, entitled "Topographia variorum Regionum;" two

landscapes, from Henry Goltzius, of which the subject of one (of 4to. size) is a cottage and figures on the sea-shore, the other is an architectural landscape in folio, with figures, in the introduction and execution of which Frisius was particularly excellent; another landscape, in which is introduced the story of Tobit and the angel, after P. Laetmann; another, with the flight into Egypt; and a very rare landscape, delicately engraven, wherein are buildings and rustic figures, in large folio.

James Fonguieres and Jodocus de Momper, or Mompert, were both born at Antwerp in the year 1580. For an account of their merits as landscape painters, see their names respectively. Both occasionally practised with success the art of etching; working from their own compositions. Fonguieres' etchings are not numerous, and consist of small landscapes: Mompert's are somewhat larger, and one in particular, which is now become rare, is a large folio landscape, a rocky scene, and etched in a very bold style, quite in the extreme of boldness.

Adrian Stalbert was also of Antwerp, and contemporary with Fonguieres and Mompert. He resided for some years in England, from whence he returned rich; though it may reasonably be suspected whether, at this period, his riches could have been obtained in this country by painting and etching landscapes. He, however, continued to paint and etch in the city of Antwerp, until he attained to upwards of fourscore years of age.

Of his etchings, the best with which we are acquainted is a folio landscape of the ruins of a magnificent English abbey, with sheep on the fore-ground: it is inscribed "Adrianus van Stalbert fecit in aqua forti."

James William Delft was the son of William James, of whom we have spoken in our account of the *Origin and Progress of ENGLISH Engraving*. He was born in the year 1619, at Delft, and died in the same city in 1661. He learned the elements of painting and engraving of his father, whose style he always copied, and which, with the similarity of their names, has occasioned their works to be often confounded. He engraved a set of portraits in ovals, of folio size, of which the following are the most remarkable: Charles I. of England; queen Elizabeth; Ferdinand II. emperor of Germany; Frederick, palatine, king of Bohemia; Frederick Henry, prince of Orange, count of Nassau Katzenellenbogen; Gustavus Adolphus, king of Sweden; James, king of England; Louis XIII. of France; Axel Oxenstiern, a Swedish minister; Philip III. of Spain; Philip IV. of Spain; Anabrotius Spinola; and Vladislas IV. king of Poland.

John Savary, or Savery, was born at Courtray in the year 1580. He studied engraving under Hans Bol, resided during most part of his life at Amsterdam, and was related to John and Roland Savery, who were both painters, and to Solomon Savery the engraver, of whom we shall next proceed to speak.

The following engravings are all we can specify by the hand of this artist, who was also a landscape painter: a set of six mountainous landscapes, with figures, in 4to., after Nic. de Clerc; a stag hunt, with a landscape back-ground, in folio; the story of Sampson killing the lion, introduced in a landscape, in large folio; and a woody scene, with a waterfall, in folio.

Solomon Savery is believed to have been a native of Amsterdam: the time of his birth we have not ascertained; but as his engravings were produced from the year 1620 to 1640, he was perhaps the son and pupil of John Savery, whom we have just dismissed. He is supposed to have passed some years of his life in England; a supposition which appears to

be confirmed by the circumstance of his principal works being portraits of the public characters of this country. But be this as it may, his merits were very considerable. He handled his graver with taste, and a degree of skill which had not then been exceeded; and expressed the textures of the various objects, which he represented, with nice discrimination; of which his portrait of John Speed the historian, among several others, affords a pleasing and satisfactory proof. His portraits are probably his best performances, though his historical subjects are not without a considerable share of merit.

Among these may be distinguished king Charles I., wherein Savery appears to have engraved the face from a picture by Vandyke, and to have added the high-crowned hat, and composed the other accompaniments; Thomas, lord Fairfax, and Speed the chronicler, of which we have spoken above, have also their heads covered with hats, to which circumstance our engraver appears to have been partial, as giving effect to the faces of his portraits, and affording scope for the exercise of his manual power over his graver.

His best historical works are, "Christ expelling the Money-changers, &c. from the Temple," in large folio, from Rembrandt; seventeen plates for Ovid's *Metamorphoses*; and a series of small plates of frieze proportions, of "The Entry of Mary de Medicis into Amsterdam."

James de Bie, or de Bye, was born at Antwerp in the year 1581, and not only distinguished himself as an engraver, but also as a draftsman and an antiquary. He studied engraving in the school of the Collaerts, and successfully imitated their style; finishing his plates entirely with the graver in a neat, clear, and determined manner.

De Bye drew correctly. The heads of his figures possess considerable accuracy of character and expression, and their hands and feet are well marked; but from his lights being so much scattered, and his shadows somewhat feeble, his chiaroscuro is by no means powerful. His prints, however, may rank with those of the best early Flemish masters. He, with his contemporary Battista Barbe, assisted the Collaerts in engraving "The Life and Passion of Christ," from Martin de Vos. The work consists of fifty plates, of which N. 18, ("The healing of Peter's Mother-in-Law.") and N. 30, ("The Resurrection of Lazarus.") are fine specimens of the abilities of de Bye, especially the latter.

He also engraved the medals of the Roman emperors, from the cabinet of the duke d'Arfehott, which were originally published in the year 1617, and of which an edition was reprinted at Berlin in 1705; a medallic history of the kings, queens, and dauphins of France; another set of the portraits of the kings of France, from Clovis to Louis XIII., consisting of sixty-four plates, of which fifty-eight are portraits; the genealogy and portraits of the house of Croix, on sixty-four plates; the portrait of Francis I. of France, in folio, after M. de Vos; and a set of metaphysical personifications from his own designs, published at Paris in 1643, with explanations by J. Baudouin.

Mark and Nicholas de Bye were of the same family with our artist, but are not worthy of much notice as engravers. Mark performed some etchings, after P. Potter and M. Gerard; and Nicholas engraved portraits, among the best of which is Charles IX. king of France.

Peter Lastman was born at Haerlem in the year 1581. He was an historical painter of merit, and is reported to have been one of the instructors of Rembrandt. Lastman etched several plates after his own compositions, in a very good taste, which are at present very rare: of these we can only specify two, the subjects of which are "Judah and

Tamar," introduced into a landscape, in small folio; and a female veiled, reclining in a bower, in 4to.

Nicholas Lastman was the son of Peter, and born at Haerlem in 1619. He was instructed in the elements of painting, and the general rudiments of art, by John Pinas; and it is probable he learned engraving from Saenredam. Among other things, he engraved the portrait of Carl von Mander, after Saenredam, in 4to.; "Our Saviour in the Garden of Olives," after his father, in large folio; "St. Peter delivered from Prison by the Angel," after J. Pinas; and its companion, "The Martyrdom of St. Peter," both in small folio; "The Good Samaritan," from a picture by himself, is probably his *chef-d'œuvre*. The story is introduced in a very picturesque landscape, towards the right side of which appears a stone-bridge over a river, along which the uncharitable priest and Levite are walking. "This print is very little known, though it deserves great attention from the taste and beauty of the execution." So says Huber: but what we have not witnessed, we cannot confirm; and what we have seen from the graver of Lastman, though neat, are tasteless productions.

For the biography and extraordinary merits, as painters, of the two Teniers, see the articles TENIERS, DAVID, the elder, and the younger. They each produced several etchings from their own compositions, which go to shew that very great painters may possibly make but indifferent engravers. By this is not meant that their etchings are devoid of fire and freedom; but that they fall short of what might naturally be expected from the high reputation which is justly attached to the name of Teniers, and particularly in that pastoral elegance of touch and handling, which confers poetic charms on their painted village festivities, in spite of the caprices of fashion, and the royal French taste of Louis XIV., who, when an admirable picture of the younger Teniers was placed before him, is reported to have turned round and said to his first valet-de-chambre, "Qu'on m'ôte ces magots!" which of course was echoed in the applauses of the whole French court.

The etchings of the Teniers find, however, a very proper and indeed indispensable place in the port-folios of those connoisseurs, who collect the productions in fine art of the Netherlands. As both the father and son marked their prints with the same cypher, which will be found in *Plate III.* of the monograms, &c. used by the engravers of the Low Countries, it is not easy to distinguish them; but the following are generally ascribed to Teniers the elder: "A Pilgrim, with his Staff and Chaplet," in 12mo.; "A Peasant seated, applying a Plaster to his Hand;" "A Peasant seated at Table, with a Crutch and Glass;" another peasant with a fur hat on; and one with a pipe; "An old Woman, with a Chaplet;" and "An old Man and Dog;" "A Man with a Staff;" a set of four, of peasant, half-length; "A German Kitchen;" another set of peasants, smoking and playing at bowls, all of octavo size; and a quarto print, called "The Bowl Players."

And to the junior Teniers are ascribed, "A Peasant smoking," he is seated on a chest, and in company with another; a landscape, with cottages and peasants conversing; another landscape, with four peasants conversing; "Villagers seated round a Tree, inside a Cabin," with the effect of moon-light, all in 8vo.; two prints of peasants travelling; "Peasants smoking at a Mark;" "The Temptation of St. Antony;" "A Flemish Festival;" "A Village Entertainment;" three heads, apparently portraits, namely, an old man with an hour-glass, an old man playing on a flute, and a lady holding a flower, small upright plates; "The Inside of a Cottage," with a dead calf hanging up.

and a man and a woman standing by the side of it, a small plate lengthways.

John Baptista Barbé was born at Antwerp in the year 1585. He studied engraving in the school of the Weirixes, and after attaining a competent mastery of the graver, and successfully imitating the dry and elaborate neatness of his instructors, he travelled to Italy for improvement.

No artist of that day, with genuine professional objects in view, could travel to Italy altogether in vain. Barbé made considerable improvement in his knowledge and taste of forms, but was not able to emancipate himself from the shackles of his earlier education.

Accordingly we find that in his latter engravings, though his figures are drawn with tolerable correctness, and his extremities well marked, his chiaroscuro is flat and powerless, and his manual execution painfully neat, dry, and insipid. He worked with the graver only; sometimes designing and inventing his own subjects; and at others, working after the originals of other masters.

Of the former kind are "The Annunciation," inscribed "Spiritus Sanctus;" "The Nativity," inscribed "Peperit Filium;" "The Arrival of the holy Virgin and St. Joseph at Bethlehem;" "The holy Virgin and Child," surrounded by a garland of flowers, and inscribed "Beatus Venter" &c.; "Jesus Christ on the Mount of Olives;" "Our Saviour with the Disciples at Emmaus;" "The Crucifixion," inscribed "Prote Fili mi," &c.; "St. Ignatius kneeling before an Altar;" and a set of four emblematical subjects, entitled "The Christian Virtue," all of small dimension.

After various other Masters.—Barbé engraved "The Holy Virgin sitting at the Foot of an ancient Monument, with the Infant Christ and Joseph," in small folio, after J. B. Paggi, (one of his best prints); another "Holy Family," in 4to. after Rubens, also in the improved style of our engraver, and certainly a meritorious work; the proof impressions of which (taken before the name of Rubens was inscribed on the plate), are rare, and bear a high price. A set of twenty-four in 12mo. of the Life and Miracles of Father Gabriel Maria, founder of the Annunciades, after Ab. van Diepenbeck; and "The Holy Virgin seated on a throne with the Infant Christ," after Francisco Frank, in small folio, and esteemed one of the masterpieces of our artist.

William van Nieuwant was born at Antwerp in the year 1585. He became the disciple of Roland Savery, but after quitting his master he went to Rome, and resided three years in that city with his countryman Paul Bril. He afterwards returned to the Low Countries, and took up his residence at Amsterdam, where his pictures were held in high estimation, and where he died in the year 1635.

Nieuwant etched several plates of landscapes, both from his own designs and those of Paul Bril. They are executed in a slight free style, and often worked upon afterward with the graver, to harmonise the lights, and strengthen the masses of shadow.

Among the etchings of this artist, the following are held in most esteem, viz. a set of sixty, of views in Italy, ornamented with figures. Two landscapes with ruins, into one of which is introduced the story of the good Samaritan, and in the other Tobit and the angel, both in folio, from P. Bril. Two marine subjects, one with shepherds on the sea-shore, and the other with vessels, and a fortress on a rock, from the same painter; "The Ruins of the Temple of Juno, in the Capitol;" "The Ruins of the Temple of Venus;" "A View of the Triumphal Arch of Septimius Severus," all in folio; and the three bridges across the

Tiber, with views of the city of Rome, engraved on three large plates, from his own drawings.

William should not be confounded with Adrian van Nieuwant, a landscape painter of some eminence, who was likewise a native of Antwerp, and who died at Amsterdam in the year 1601.

Peter Holsteyn was born at Haarlem in the year 1582, and resided in Holland at the commencement of the seventeenth century. He occasionally practised the art of painting on glass; but was chiefly an engraver of portraits, among the chief of which are a set of twenty-six of the plenipotentiary ministers of Munster; John Saenredam, and Jacob vander Burchius, both in ovals; Fabius Chili, a negotiator for peace from Westphalia, afterwards pope Alexander VII.; John Ernest Picotus, a counsellor of the elector of Saxony; all of 4to. size; John Huydecoper, burgomaster of the city of Amsterdam; John Reyner, historiographer for Munster; Constantius Sohner; and Albert Vukenbrink, a sculptor of Amsterdam; all in folio.

Cornelius Holsteyn was likewise born at Haarlem in the year 1620, and was the son of the preceding artist, of whom he learned the elements of art. He painted history with a moderate degree of success. He likewise engraved some subjects from his own designs, and several of the plates for the cabinet of Gerard Reynst, a magistrate and connoisseur of Amsterdam. Yet of his engravings we are able to name only the following: a bacchanalian subject, of children at play, forming a long frieze, engraved on six plates, a very rare print; and a female seated, ornamented with jewels, supposed to be the portrait of Isabella, marchioness of Mantua, from a picture by Correggio, or Julio Romano; engraved on a large folio plate for the cabinet of Reynst.

Peter van der Borch was born at Brussels in the year 1540. The period of his life has not been recorded, but he appears to have resided in his native city, except, perhaps, occasionally in that of Antwerp, till some years after the commencement of the succeeding century.

He acquired some reputation in landscape painting, but applied himself to etching with still greater assiduity, and produced a considerable number of prints, most of which may be properly termed historical landscapes. They are etched with little care, in a rough and licentious kind of style, and the figures which are introduced are by no means correctly drawn.

Though the works of this artist manifest great fertility of invention, they evince no very profound knowledge of composition, nor perception of the susceptibilities of the engraver's art, and, therefore, but little judgment. He usually marked his prints with his initials, or a monogram, which will be found in our third plate of those used by the engravers of the Low Countries.

Of the numerous works of this artist, it may suffice to mention the following:—The History of Elias and Elijah, in ovals of 4to. size. A set of landscapes, with subjects from the New and Old Testaments, in 4to. Rural festivals, in folio; a company of archers regaling; a peasant's wedding, both in folio. A landscape with the history of Hagar and Ishmael, in large folio; a folio print, entitled "Emblemata sacra e præcipuis utriusque Testamenti historiis concinnata;" and a set of one hundred and forty plates, from Ovid's metamorphoses, in 4to.; printed and published at Antwerp by Theodore Galle.

Henry van der Borch, the elder, was born at Brussels, A.D. 1583, and died at Frankfort in 1660, where his family were obliged to seek an asylum from the political troubles which agitated their native country. His father, on discovering

ing his taste for the arts, placed him under Giles Valkenbourg, from whom he learned the rudiments of art, and whom he afterward accompanied to Italy.

Italy was at that period at once the grave and conservatory of ancient art; and sculptural wonders were every day dug from the ruins of the classical ages. The knowledge and opportunities of vander Borcht during his residence in that country, enabled him to form a collection, which the English earl of Arundel had afterward the honour of purchasing.

From Italy our artist returned to Frankenthal, where he resided some time, and afterwards migrated to England, but finally returned to the Netherlands. His portrait was engraved by Hollar, from a picture by his son, who, being of the same name as his father, is often confounded with him; but the engravings which are most generally ascribed to the former, are "The Holy Virgin and Child," after Parmegiano, engraved at London in 1637, in small folio. "A Dead Christ, before the Entrance of the Sepulchre," in 4to. after a copy by Parmegiano from Raphael's original, in the Arundelian collection. And a set of twenty-two in small folio, of which the subjects display the entrance of the elector palatine Frederic, with Elizabeth, the princess royal of England, into Frankenthal. It was accompanied with descriptions by Miroulet, and was published in the year 1613.

Henry vander Borcht, the younger, was born at Frankenthal in the year 1620, and was the son of the preceding artist. At an early period of life he appears to have discovered talents both as an artist and an antiquary. The earl of Arundel, when on his travels, found Henry at Frankfort, and sent him into Italy to Mr. Petty, who was then collecting art and antiquities for his lordship, and hence he was retained in the service of that nobleman as long as he lived.

After the death of his patron, Van der Borcht was employed by the prince of Wales, (afterwards Charles II.) and lived in esteem at London, but afterwards returned to Antwerp, where he died at an advanced age. The portrait of Vander Borcht, the younger, was engraved by Hollar, after J. Meyfens, and his monogram will be found among those of our engravers of the Low Countries.

The following engravings, which are chiefly from the Arundelian collection, are attributed to him. "Abraham entertaining the three Angels," after Louis Caracci; "The Infant Christ embracing St. John," copied from a print by Guido; "A female Figure offering a Cup to another who is kneeling," after Correggio; and "Apollo and Cupid," in an oval; all of 4to. size. This artist used a monogram, for which see our *Plate III.* of those used by the engravers of the Low Countries.

Count Henry Goudt, of whom we shall next treat, is among the rare instances that art may boast, and that Fortune in her caprice has allowed us to exhibit, the tenour of whose life and pursuits is in direct hostility to an ungenerous and immoral maxim, which, promulgated by the proud and unfeeling among lax philosophers, has obtained but too much credit and currency throughout Europe.

The maxim to which we here allude, is, that the goadings of the iron (which sophistry has misnamed the golden) spur of necessity is indispensable to the due progress of genius. Count Goudt was born in affluent circumstances, and of a noble family, and yet became a great artist, as well as an exemplary man.

Among that class of society, toward which meritorious professors of the fine arts are allowed to look for patronage and encouragement, are some—always more considerable

from their rank and infectious example, than from their numbers—that would justify the perversion of riches and of reasoning, by perverting Nature also, and who, mistaking what might possibly be applicable to the exertions of mere manual industry, for the springs of mental expansion, imagine, and inculcate with all the luxurious languor of infinite complacency, that the plants of genius thrive best in a rugged soil; that the chilling damps of poverty supply the ardours of talent; that starvation is the very pabulum of ability; and that mind soars the higher for being chained to the earth. Before these intellectual arithmeticians of exquisite feeling and refined liberality, proceed to calculate by what inverse ratio of discouragement the apotheosis of genius may be consummated in the extinction of its final spark, it might be well for them to attend to the leading traits which mark the life of this distinguished engraver.

Henry de Goudt, knight of the palatinate, and usually called (but whether by courtesy or by right we are ignorant) count Goudt, was born of a noble family at Utrecht, in the year 1585.

Among the few professions which, from the state of European manners and philosophy, are allotted to gentlemen of a certain rank, young Goudt observed, that in the army officers were, by the very nature of the tenure by which they held their commissions, obliged to resign the noblest characteristic of their nature as men,—namely, the privilege of judging for themselves; and resign it too, in cases touching the lives and liberties of others, which of all possible cases are the most interesting and important to minds of feeling. Young, and active-minded, but tender-minded, as he was, he could not but perceive, that soldiers became at once, from the essential nature of military service, that degraded rank of beings, which philosophic patriotism itself reluctantly glances at, and almost fears to call the slavish instruments of the destruction of their fellow men. A state of society, and a principle of mental and corporeal occupation, which converts the horror of philanthropy into the basis of merit; which requires that men, for the sake of being termed military officers, and the false glory that accrues from it, should abdicate their own natural rights and powers of reasoning on the justice of the causes of national quarrel in favour of hereditary rulers, however feeble-minded, or ignorant, or ill advised, was not, could not be, the voluntary choice of a mind attuned to the harmonies of art and nature.

In the church, our uncontaminated youth saw, that though religion was not denied to be an affair between individual man and his Creator, yet that no public teacher might think and act for himself, unless he voluntarily embraced the trammels of episcopacy, without incurring the reproach and the penalties of heterodoxy.

The law was repulsive, inasmuch as principle was rather overwhelmed and endangered, than recognized and refreshed, and sustained, in acts of memory and the sophisms of rhetoric.

Of the study and practice of medicine, Goudt might with justice think much more favourably: yet, to produce good, was better than to remedy evil. But in preferring and following the proper objects of imitative art, to which it may have been, that the natural bent of his genius (still more inclined him than this process of ratiocination, he anticipated the lofty, and independent, and virtuous, satisfaction of contributing the utmost of his pleasurable exertions, free from the restraints of human tyranny, to the pleasure and improvement of his countrymen: and as he could do this with dignity and delight, he hesitated not long in resolving to become an artist; and with this view, and ample means of accomplishing his object, he set forth on his travels to Italy, at that

time the great hieropolitan temple, the sanctified centre of pilgrimage, where, from all parts of the civilized world, met the devotees of art.

The wonders of Rome, the miracles of art which he there beheld, called forth all his enthusiasm; but taught him to hope humbly. He applied himself with assiduity to the practical study of art; and drew diligently in the Roman schools: but under what master he learned the rudiments of engraving is not known. Nor is it surprising that the progress of his improvements was rapid: for this will ever be the case where the mind of a student is operated upon by pleasurable stimuli alone, and is free from the restraints and pecuniary obstructions by which the advancement of a large majority of artists is sadly retarded.

In this great metropolis, surrounded and pervaded as it is by an highly salubrious atmosphere of art, every mind devoted to such pursuits, freely inspires and imbibes what is congenial to its nature. Adam Elshiemer of Franckfort, of whom we have treated in vol. xiii., had been studying there for some years when our young artist arrived, and the admiration with which he beheld the works of that great painter, gradually brought them acquainted.

Another circumstance contributed much to increase their intimacy. The misfortunes of Elshiemer had been pitied, but not relieved. Goudt had the happiness of releasing him from prison, and of becoming at once the firm friend, pupil, and generous benefactor of the man in the world, to whom, of all others, he looked up with the most heartfelt reverence.

From this period he studied under the direction of Elshiemer, and appears to have exclusively devoted himself to the task of engraving after his pictures. We know not of a single work of Goudt's that is engraved after any other master.

From this period, too, his peculiar talent for engraving began to develop itself. By comparing nature with the exquisite productions of his master, he formed an original style of engraving, in most (though we think not in all) respects perfectly homogeneous with that of Elshiemer's painting, and which discovers deep and clear insight into the recondite energies of the engraver's art. No man before Goudt had produced those bright, sudden, and powerful effects of *chiaro-scuro*, which we behold with so much gratification in his fire, moon, and torch, light, from which the engravers of the present, and of after ages, may study with advantage. No man, like Elshiemer, had dipped his pencil in the depth of night, and in the dawn of morning. And no man before Goudt, and scarcely any since, has been able to suggest, in his engravings, the shades between dubious and positive colour which then prevail.

His "Aurora" is, in this respect, a perfect master-piece. The scene is a bird's-eye view, or rather a view from an eminence, over a hilly and extensive country: but the freshness of a summer's morning, at the early hour of day-break, is rendered with poetic felicity. It is, in the words of Gray, an

———"incense-breathing morn."

And the charmed spectator sees the mill: exhaling, and listens with a poet's ear to the hymn of inanimate nature.

All had hitherto been enjoyment with count Goudt. As Virtue beckoned him forward, Pleasure attended his steps, and strewn his path with flowers. But earth is not heaven, and sublunary happiness is rarely of long continuance. It was the ill fortune of our artist to live during the Aurora of rational philosophy, when sir Francis Bacon had not shone forth, and mystery and credulity were not dis-

sipated. He remained at Rome as long as Elshiemer lived; but on his return to Utrecht, a superstitious female, by whom he was beloved, the Medea of the town, believing in the occult virtues of herbs and minerals, when combined with judicial astrology, to controul or inflame the passions, administered, at an entertainment, what was termed a love potion, which she fatally believed would have the effect of fixing his affections on herself; and thus literally poisoned his cup of delight. He was from this time afflicted with a species of delirium, or idiotism, of the most melancholy character, under which he languished for some considerable time, and at length died in his native city, at the age of forty-five.

It has been remarked as extraordinary, but is probably only an ordinary denotation, and result of the master-passion, that though the mind of Goudt was lost to every other interest; yet, when fine art became the subject of conversation, he would discourse upon it in a very rational manner.

By those who do not narrowly examine his prints, it will scarcely be credited that the graver was the sole instrument of his art, so remarkably loose and free is his delineation of the forms of uncultivated objects. A striking instance of this, may be seen in the vine-leaves, and other foliage, near the door of the cottage where Ceres is drinking from a picher. His effects are always powerful, and his shadows produced by near and numerous cross-hatchings; so that in very dark recesses he sometimes has not fewer than five courses of lines. In commenting on the above print, Strutt observes, that, "considering the precision with which he executed his engravings, the freedom of handling the graver, which may be discovered in them, is very astonishing. The weeds, and other parts of the fore-ground in that admirable print of Ceres, are very finely expressed. The heads of the figures are correctly drawn, and the other extremities are managed in a judicious manner. The powerful and striking effect of this engraving cannot be properly described. The very deep shadows are perhaps rather too sudden upon the strong lights in some few instances; but in the fine impressions this is by no means so conspicuous as in those after the plate had been re-touched."

His engravings, from the elaborate neatness and care bestowed on them, could have been but slowly produced; when we reflect, too, that his object was to excel other men in the merit, not the number of his prints; that he followed this art only for the pleasure it afforded, and did not engrave when his mind was not attuned to the pursuit, it will not appear surprising that the number of his performances should be so small.

The following seven are generally enumerated as being the whole of his works; they are all after the paintings of his friend Elshiemer; but the collection of Mariette contained nine, which, at a public auction at Paris, were sold for two hundred and seventy livres.

1. The Ceres mentioned above, in small upright folio, which is by some distinguished by the title of "The Sorcery;"
2. The Flight into Egypt, in folio; and a landscape (with small figures) in which the effects of fire-light and moon-light are contrasted with great skill: the stars also shine forth, and the *via lactea* is faintly discernible.
3. Another landscape, in small folio, in which the angel and Tobit are introduced. The weeds on the fore-ground of this engraving, and the branches of the trees in front, as well as the foliage and weeds hanging from them, are beautifully expressed. On this print an observation has been made which is applicable also to several passages in the other engravings of Goudt; namely, that he fails in the distant woods, which graduate one from

from another, and require that freedom of determination which etching alone can give.

Of the subject of "Tobit and the Angel," there are two prints by this master. In the first, Tobit is dragging the fish along; in the second, which is of 4to. size, he holds the fish under his arm, whilst, with Raphael, he is crossing a stream of water by means of stepping-stones. 5. Baucis and Philemon entertaining Jupiter and Mercury, in 4to. dated 1612.

6. The Aurora, upon which we have commented above, and 7. A very small oval print of "The Decollation of St. John the Baptist," are all the engravings, by this master, with which we are acquainted, and the last, which is of the least intrinsic value, is by far the feeblest. Perhaps the additional two that were in the collection of Mariette were nothing more than juvenile attempts of our artist.

Of Robert Vander Voerst, the meritorious rival of Vorsterman, we have already treated at some length. (See *ENGLISH ENGRAVING, Origin and Progress of.*) He was a native of Arnheim, and born in the year 1596.

Michael Natalis was born at Liege in the year 1589. He was instructed in drawing by Joachim Sandrart, but learned the rudiments of engraving at Antwerp of Charles Mallery. From Antwerp he travelled to Rome, where he joined Cornelius Bloemart, Theodore Matham, and Regnier Persyn, (all artists from the Low Countries), and assisted them in completing the statues and busts of the Justinian gallery, consisting of one hundred and fifty prints. Stimulated by emulation, and assisted in his studies by Bloemart, Natalis now made considerable progress in his art. He engraved many other plates from the pictures of the great masters of Italy; and after his return to Flanders, was invited to Paris, where he resided a considerable time. Natalis engraved somewhat in the style of Bloemart: his prints have merit; yet the square-grained mode of execution, to which he was partial, does not happily express flesh or drapery, but is rather adapted to the representation of stone.

When he quitted this open square manner, which was very seldom, his prints were mellow and soft; but the heads of his figures want character, and the other extremities are but indifferently drawn. He frequently combined his initials in a monogram, for which, see *Plate III.* of those used by the engravers of the Netherlands. His portraits are the most esteemed productions of his graver, from which we shall select the following as being most worthy of the reader's attention.

Portraits.—Josephus Justinianus Benedicti Filius; Jacob Catz, a Dutch poet; Eugenius d'Alamond, bishop of Ghent, in large folio; Maximilian Emanuel, elector of Bavaria, after his first master; Joach. Sandrart; and Frederic, count of Merode, both in large folio; Gabriel Maria, theologian, from Abr. van Diepenbeck; Ernestine, princess of Ligne, and countess of Nassau, from Ant. Vandyke; and the marquis del Guast as Mars, with his mistress, in the character of Venus, after Titian, all in folio.

Historical, after various Masters.—"The Holy Family," from Raphael, in large folio; "The Virgin and Child, with Joseph seated behind, leaning his Head on his Hand," after Andrea del Sarto, in folio; "The Holy Family," a grand composition, from Poussin, in large folio: the first impressions are before the nudity of the infant was covered with linen. "The Extacy of St. Paul," from a picture by the same painter, belonging to the cabinet of the kings of France; "The Holy Family, with Angels scattering Flowers over the Head of the Infant Christ," from Seb. Bourdon; "The Marriage of St. Catherine," from the same painter, all in large folio; "St. Bruno at his Devo-

tion," after Bertholet Flemel; "The Assembly of illustrious Ecclesiastics," a large print, lengthways, engraved on four plates, from the same painter; "Mary washing the Feet of Our Saviour," from Rubens, a large folio plate; "The last Supper," in folio, from Diepenbeck; "St. Francis," in large folio; "St. Henry," and "St. Cunegonde," in folio; and an allegorical Thesis, dedicated to the emperor Ferdinand III., on two large plates, all from the same master.

John Valder was born at Liege in the year 1590, and resided during the greater part of his life at Paris. He does not appear to have been a man of any genius, or of much talent: he wanted that animation which is necessary to form a great artist; instead of which, in him was substituted a painful laborious attention to the neatness and precision of the mechanical part of his plates, and in this respect he has succeeded, so as in some instances to excite our surprise. In France he engraved part of the plates for a book, entitled "The Triumphs of Louis the Just," a work which consists of forty-nine engravings, and which was printed at Paris A. D. 1637, in one folio volume; the few following are likewise by his hand, all small upright plates; "Jesus filius Dei;" "Ecce Ancilla Domini;" "St. Catharine;" "Regnum Mundi;" "Jesu Christi;" "Virgo Gratia Valentina Miraculis Clara;" "The Head of St. Ignatius of Loyola," the face of which is so neatly executed, that the dots which blend the lights with the shadows, are hardly perceptible to the naked eye; and "A Holy Family reposing," in folio, from Herm. Swanvelt.

Cornelius Schut was born at Antwerp, A. D. 1590, and died in the same city in 1660. He was the disciple of Rubens, and painted historical and poetical subjects with much success. Schut likewise handled the point in a very free spirited style, resembling that of Castiglione, but bolder and more determined. The drawing of the naked parts of his human figures is often incorrect, but the characters of his heads are generally expressed in a masterly manner. From his numerous etchings we select the following:—A set of one hundred and thirty-three prints of various subjects and dimensions, from his own designs; four Virgin Marias, half-length figures, in 12mo.; "The Holy Family, accompanied by St. John;" "The Virgin and Holy Infant;" "Christ on the Mount of Olives;" "The Virgin surrounded with Rays of Glory, and worshipped by the Saints of Paradise," all in folio; "Mars, Venus, and Flora," a small upright oval; and its companion, "Bacchus, Ceres, and Pomona;" "A Sacrifice to Venus;" "The Triumph of Peace," and "The Triumph of Neptune," all of folio size; and "The seven Liberal Arts," a set of eight middling-sized plates, lengthways.

This artist is sometimes confounded with his nephew Cornelius Schut, who was director of the Academy at Seville, and a portrait painter of some reputation; but the latter is not known to have engraved at all.

Cornelius de Wael, or Waal, was born at Antwerp in the year 1594, and died at Genoa in 1662. His father was a painter, and he learned the elements of art under his paternal roof; but afterwards travelled to Italy, and studied under various masters. He painted battles, landscapes, and historical subjects, with great success; and was patronised both by Philip III. and the duke of Arschot.

De Wael engraved several of his own compositions in a very spirited style; his figures have much expression and are very correctly drawn, and his chiaroscuro is better than that of the majority of his contemporaries. Among his best etchings are, a set of seven, intitled "Ilbri. D. D. Gaielmo Vander Stradan, venustas hache imagines, C. de Wael"

Wael amoris dicat." 1. Represents a fountain playing on some figures who are running to avoid it. 2. Hunters halting at an inn door. 3. Peasants beating an overladen ass. 4. A quack doctor shewing specimens of his skill at the door of a tavern. 5. Peasants before an alehouse door. 6. A man on an ass, and spectators laughing at him. 7. An assembly of people of rank of both sexes; and a tennis-court with peasants fighting; a small plate lengthways.

Cornelius had a nephew, John Baptista de Wael, who engraved several of the pictures of his uncle, and among them "The Life of the Prodigal Son," in eight small upright plates.

Lucas Van Uden was born at Antwerp in the year 1595, and became a very distinguished painter and engraver of landscape. He was instructed by his father, who was also an artist, but, by his accurate observation of nature, Lucas soon surpassed him in merit. He particularly studied, and was happy in representing, the various effects of sun-shine, from the first dawn of morning till his light feebly glimmers in the evening horizon. Rubens saw his landscapes with admiration, and sometimes peopled them with figures, while Van Uden returned the favour by occasionally painting the landscape back-grounds of that great master. His skies and distances are beautifully clear and finely toned, while of his trees it has been said that their foliage was so loosely pendant, that it seemed swayed by the motion of the air.

Van Uden etched many of his own compositions, and some few plates from those of other painters, with great delicacy, spirit, and freedom. Huber thinks that his prints merit not less praise than his pictures. Among them may be distinguished three pairs of small, but beautiful, landscapes, consisting of village scenery adorned with trees and figures. A landscape of pastoral character, on the foreground of which is a piping shepherd with his flock. A landscape with a wooden bridge and two windmills. A landscape adorned with travellers, with a woody foreground, and the city of Antwerp in the back-ground. A landscape with figures carrying a litter, in folio. Four fine landscapes after Rubens, in small folio, the earliest impressions of which are without the name of the painter. 1. A landscape, and figures conversing. 2. Cows in a river, and a man bringing horses to drink. 3. A landscape, with water, cows, and figures. And 4. A landscape, in which are two women with baskets. A landscape, into which a holy family is introduced; and another with the good Samaritan, both in folio, after Titian.

Of that well-known and very distinguished artist, Jacques Jordaens, we have already treated as a painter in our nineteenth volume. (See JORDAENS.) His biographers have stated, that his early marriage prevented that journey to Italy, which was at the time esteemed an almost indispensable part of the education of an artist. Whatever cause kept him at home, taught him to depend less upon other men, and more upon nature and himself, and to this it is probable, that if we owe his low choice of subjects, we owe also the vigour by which his productions are characterized.

His etchings are hastily performed, but glow with the fire, and teem with the intelligence of a master. According to Hecquet, who has favoured the public with a catalogue raisonnée of the works of Jordaens, they are thirty-three in number, and Huber has justly regretted "that they are not more numerous, as they rank with the finest productions of the Flemish school."

In collecting these etchings, which are all from compositions by Jordaens himself, the connoisseur will bear in

mind, that the earliest and best impressions are inscribed with the words "cum privilegio."

Of the thirty-three prints mentioned by Hecquet, we are only able to enumerate "The Flight into Egypt," dated 1652; "Jesus Christ expelling the Money-Changers from the Temple;" "The Descent from the Cross;" "Mercury beheading Argus;" "Jupiter and Io;" "The Infant Jupiter suckled by the Goat Amalthea;" "A Peasant arresting an Ox by the Tail, amidst a great Concourse of Spectators." These are all in small folio, and engraved in the course of the same year, namely 1652. "Saturn devouring his Children;" a very rare 4to. plate, without any name or cypher, is also attributed by most connoisseurs to the hand of Jordaens.

John Percelles, the pupil of H. Cornelius de Vrooms, was born at Leyden in the year 1597. His son Julius was a native of the same city, and both excelled in painting and engraving shipwrecks, and other marine subjects. From the circumstance of the works of the father and son being marked with the same initial letters, some confusion has arisen; nor is it known whether to attribute the twelve small sea views which bear these initials, to John or Julius.

Another set of twelve in folio, of which the subjects are the Dutch navy, are etched in a somewhat broader style, and are most likely the performance of the elder Percelles, being inscribed "Notatæ a famosissimo Navium Pictore Johannes Percelles," without any separate mention of the engraver's name.

Roland Rogman, or Roghman, was also born at Leyden in the year 1597, and died there in 1685, or 1686. He was an original artist; he studied under no master, but formed his style, both of painting and etching, from the studious contemplation of nature only. His pictures are spoken of with great commendation, and he etched several landscapes, which consist chiefly of views in Holland and the Low Countries, in a sketchy, but masterly style.

Among them may be distinguished "A View of the Castle of Zuylen," in folio; a pair of ditto with bridges and canals, &c. in 4to. A set of four mountainous landscapes and figures, in 4to.; and another pair of town views, in folio.

Gertrude Rogman is believed to have been of the same family with Roland, after whose pictures she executed several engravings, among which is a set of four in small folio, of the domestic occupations of the fair sex.

The family of Van de Velde are of great celebrity in the annals of fine art. Esaus, or Isaiah, was born at Leyden, A.D. 1597. He became the disciple of Peter Deneyn. With what talent he painted landscapes and battles will be spoken of in our biography of VAN DE VELDE, as a painter. His etchings, which are executed with considerable firmness and intelligence, are rare, and, what is much better, are of intrinsic value. A landscape, with peasants drinking on the foreground, in folio. Another of quarto size, with a bridge and round-tower, in which is introduced a shepherd and shepherdess tending their flocks. Another, with cottages among ruined architecture; and another of pastoral character, with a shepherd's hut near the foreground, of folio dimensions, are all we are able to enumerate of the engravings of Isaiah Van de Velde. He sometimes combined his initials in a monogram, which will be found in *Plate III.* of those used by the artists of the Low Countries.

John Van de Velde, brother of Isaiah, was born in the same city, and in the following year; and though a painter of great merit, is, perhaps, better known by his excellent engravings;

engravings; which are numerous, and are executed in two distinct and very different styles.

The etchings he produced are very bold and determined. The lights are kept broad and clear; but perhaps the shadows may, in some instances, want strength: however, the hand of the skilful master is evident in all of them; and the small figures which are occasionally introduced, prove the goodness of his taste, by the spirited manner in which they are executed.

His other style of working was with the graver, assisted occasionally with the dry point; these prints are excessively neat and laboured, and resemble those of count Goudt in the vigour of their general effects; they consist chiefly of scenes by candlelight, and such subjects as require great depth of shadow; yet, with all the merits which they possess, they are not, on the whole, equal to his etchings; for whatever advantages may appear to be gained in neatness and toning, are lost in their want of that spirit, lightness, and freedom by which his etchings are characterised.

The following will probably be found most worthy of the attention of the connoisseur: beginning with his portraits: John Van de Velde, himself, in large quarto; Jacob Matham, from P. Soutmaus; John Torrentinus, a very fine and rare print, in large quarto; John Crucius, a clergyman of Haerlem, of the same size; Michael Middelhoven, F. Hals, pinx. in quarto; John Acronius, theologian, in folio; Jacob Zaffius, archdeacon of Haerlem, in folio, both from the same painter; John Oven, (engraved in mezzotinto); John Haccius Pontanus, historian, both in 4to.; Charles, duke of Troppau and Jaegerndorf, in folio; Oliver Cromwell, a very rare portrait, in large folio; and Lawrence Colter, of Haerlem, with a long Latin inscription, in 4to.

Historical Landscapes.—"The Adoration of the Kings," after P. Molyn. In this engraving the effect of night is well managed. "The Magic Lanthorn," after the same painter; "The good Samaritan;" "An Old Woman frying Pancakes, and Boys eating them," all in small 4to.; "A Peasant and his Wife going to Market, at Day break, with Cows and Goats," in folio; a landscape with ruins, and a cow-herd tending cows, in octavo; "The Mountebank exposing his Medicines," a capital print; "The Gamesters," with a striking candle-light effect, both in folio; "A village Festival," a very rich composition; two landscapes, one representing buildings and travellers by moonlight, the other sun rise, and travellers; two landscapes, one with figures fishing by moonlight, and villagers warming themselves by a large fire, the other travellers by sun-rise, in folio; four subjects from the History of Tobit, in 4to.; the four parts of the day, very beautifully finished plates; the four elements, after W. Bugtenwegh, in folio, with very fine effects; the four seasons, in large folio; a different composition of the same subjects, in large folio; the twelve months of the year, in quarto; another set of the same subjects, engraved in a broader style; a champaign country in Holland, with robbers attacking a coach at the entrance of a wood; a champaign in Italy, with buildings and water, after P. Molyn the younger, or the chevalier Tempesta, both in large folio; an open country, with ruins and travellers, in folio; the bridge of St. Mary at Rome, in large folio; a view of the cattle of Bruxelles, a very large and rare print; and a set of landscapes, intitled "Playfante Landshappen," all of folio dimensions.

Adrian Van de Velde was born at Amsterdam, A.D. 1639, and died in the same city in 1672. He was the nephew of John, whom we have just dismissed, and the disciple of Wynants. As a painter he will be treated of in a future volume.

To speak of him as an engraver, we have, by this master, a set of twenty etchings, executed in a very free and spirited style, of cattle and peasantry. Another set of ten plates of groups of cows and other domestic animals, with a bull for the title page; three plates of sheep; the return from hunting, in quarto; a large landscape, lengthways, and a smaller one of the same form, enriched with historical figures, both rare prints, but the latter by much the rarest.

John Miel was born in a village, near Antwerp, in the year 1599, and died at Turin in 1664. He learned the rudiments of art of Gerard Seghers, and afterwards travelled to Italy for improvement, where he studied in the school of Andrea Sacchi.

By contemplating the best works of the Italian masters, he by degrees emancipated himself from the trammels of his earlier education, and formed a style of art for himself, in which the general characteristics of those of Flanders and Italy, were happily blended.

The talents of Miel, and the reputation which followed and brightened their exercise, induced Charles Emanuel, duke of Savoy, to invite him to Turin. Under the patronage of this nobleman he remained five years, and the duke was so fond of our artist, that he invested him with the order of St. Maurice, and presented him with a diamond cross of great value; notwithstanding which favours, he languished in vain to return to Rome. Rome was the place where he had beheld those objects that first expanded his mind with the pleasures of art. Hence his wishes to return thither, and hence the regret which is by some supposed to have shortened his days. If he gained honours, he had sacrificed liberty and independence at their shrine, and did not, therefore, enjoy them.

Miel etched several plates from his own compositions in a very masterly style: and the figures which he occasionally introduced are drawn with great spirit and freedom.

Among these are "The Assumption of the Virgin Mary;" "The Holy Family;" four pastoral subjects, with shepherds and cattle, beautifully executed, in quarto, and an unknown number of battles and skirmishes for Strada's Wars of Flanders.

Philip Verbeck, or Verbecq, a Dutch engraver of slender talent, was born some time about the close of the sixteenth century. He is chiefly remarkable for having etched some plates in a scratchy manner, which bears inferior resemblance to the style of Rembrandt.

Inferior, as is this resemblance, it has led some collectors into the error of purchasing his works and placing them in their Rembrandt portfolios. Gerfaint first informed them of their mistake, and by comparing Verbecq's etchings with those of Rembrandt, not only the name or cypher of the former artist may be observed, but the dates also of his engravings, which shew that he was anterior to Rembrandt, and therefore, at least, not a copyist.

The following are all we are able to specify from the hand of this artist, and which are much sought after. "Esau selling his Birth-right;" "An eastern King, seated on his Throne, with a Suppliant kneeling before him," both in 4to; "A Shepherd, seated at the Foot of a Tree;" a bust of a young lady in a bonnet and pelisse; and a three-quarter portrait of a nobleman in a tartan and feathers, (companion to the above,) all in small ovals.

Rodermond, Rottermond, or Rottermans, with whose Christian name we are unacquainted, was also of Holland, and born in the year 1650. He etched several portraits and some other plates much in the manner of the preceding artist, and with at least equal freedom and spirit. Among these are sir William Waller, major-general of the parliamentary army, with a battle in the back-ground, after C. Janfen; John the fe-

cond, a celebrated Latin poet, a very rare print, inscribed "Johannes secundus Hagienfis Poeta. Rodermont fecit," in large 4to.; a three-quarter view of a man with a curly beard, (this print, which is not above mediocrity, is in the style of Rembrandt: by Gerfaint it is attributed to Verbecq, and by Bartsch to Rodermont); and "David praying," with his harp and turban beside him, in 4to.

Peter van Sompel, or van Sompelin, was born at Antwerp in the year 1600; and became the pupil of Soutman, whose style he always copied. He drew correctly, and treated the naked parts, and especially the extremities of the human figure, with intelligence. He engraved in a neat laboured style, especially his portraits after Vandyke and Rubens, among which the following will be found most worthy of notice.

Portraits.—Paracelsus, the celebrated physician, in folio; the emperor Adolphus of Nassau, in large folio; Marianna de Ravaria, wife of the emperor Ferdinand; Henry, count of Nassau, and Philip of Nassau, prince of Orange, both in large folio; and all from Soutman. The emperor Charles V., from Rubens; cardinal Ferdinand, brother of Philip IV. governor of the Low Countries, from Vandyke; Isabella Clara Eugenia, infanta of Spain; Gallon John Baptist, duke of Orleans, brother of Louis XIII. and Margaret his wife, all from Vandyke. Philip the Hardy, duke of Burgundy, from Van Eyk; Frederic Henry, of Nassau, from G. Honthorst; all of large folio dimensions.

Historical Subjects.—"Christ on the Cross," a large upright plate, arched at the top; "Christ coming with the Pilgrims at Emmaus," in folio, nearly square; "Erich-tonius in the Basket, discovered by Aglauros and his Sisters," all from Rubens, and "Ixion deceived by Juno," from the same painter; all in large folio.

William de Leeuw was born at Antwerp, A.D. 1600, and flourished in the Netherlands in 1650. He was a pupil of Soutmans, but did not engrave in his style; instead of which he employed short playful strokes, which produced a picturesque effect, united with a tolerably good chiaroscuro. Most of his engravings are from Rubens or Rembrandt, but in a set of large landscapes after Nieulandt he has quite altered his manner of execution, and engraved the ground and sky in a manner so delicate, that it requires good eyes to distinguish it from a tint of Indian ink.

De Leeuw commonly marked his prints with his initials, or a monogram, which will be found in *Plate III.* of these used by the engravers of the Low Countries. The following are a selection of his best works: "Lot and his Daughters," in folio (the best impressions of this plate are before the name of C. Dankerts was inserted); "Daniel in the Lion's Den," in large folio; the Holy Virgin kneeling, supported by angels, commonly called "The Virgin of Grief," a very rare print, in folio; "The Martyrdom of St. Catherine," a very fine and rare print, all after Rubens, and a set of four chases, from the same painter, namely, the chase of a lion and hounds; ditto of a wolf; ditto of a wild boar; ditto of a crocodile and hippopotamus; all in very large folio. "Tobit and his Wife," in folio, from Rembrandt. This print is executed in a very good taste, and has a fine effect. "David playing the Harp before King Saul;" a half-length profile of Rembrandt's wife, both in large folio: the portrait of a female veiled, at the bottom of the print "Marianne" is inscribed in capital letters; all after Rembrandt. A young man habited in a cloak, and a hat and feathers, in small folio; "St Francis meditating," a half-length profile, from Livens, in folio. And the following set in large folio, from Nieulandt, which are very rare and

beautifully executed. A view in the Tyrol, with water, cascades, and travellers. Another scene in the mountains of Tyrol, with travellers on horseback; to the right a high mountain is crowned with the ruins of a temple, and on the plain below is a hermitage and two figures. A landscape of the same character as the former, with wood and water; cows feeding on a plain and the effect of sun-set. And another with fishers, and men on horseback: on an eminence towards the right is a church, and on the plain below a village and sheep feeding.

John Louys, or Loys, was born at Antwerp, A.D. 1600, he was the disciple of Soutman, and engraved chiefly after the pictures of Rubens and Vandyke. There is a very fine engraving by him, with a powerful chiaroscuro, of "The Resurrection of Lazarus," from J. Livens, which is generally and justly regarded as his masterpiece. From among the works of this artist, the following are most worthy of selection.

Portraits.—Philip the Good, duke of Burgundy, from Soutman; Louis XIII. of France, from Rubens, and its companion, Ann of Austria; Philip IV. king of Spain, from Rubens, and its companion, Elizabeth of Bourbon, his queen; and Francis Thomas of Savoy, prince of Carignano, from Ant. Vandyke; all of large folio dimensions.

Historical, &c.—"The Resurrection of Lazarus," which is mentioned above; "The Repose of Diana, or the Return from the Chase," from Rubens; "The Inside of a Flemish Cottage, with a Woman scouring a Cauldron," after Ostade; "Peasants regaling," and "The Chestnut Seller," after the same master, all in quarto; and "The Interior of a Dutch Kitchen," in which the principal object is a dead pig hanging up; in folio, after W. Kalf.

Jonas Snyderhoef, of Leyden, was another of the disciples of Soutman, born in the same year with the preceding artist, but of very superior abilities.

Snyderhoef pursued the style of engraving which had been invented or adopted by his master, but, by degrees, far surpassed him in the softness and beauty of his finishing. He had the art of uniting great force, as well as harmony of chiaroscuro, with considerable neatness of execution, and, where his subject required it, with great exactitude of detail. His engravings are justly held in esteem by the experienced collector, and by all men of taste. His portraits, of which he executed a considerable number, are exceedingly beautiful, and probab'y, on the whole, superior to his historical works. His practice was, to bring them very forward in the etching, and afterwards strengthen them, where deeper shadows were required, with the graver; imparting to them, at the same time, amenity of tone, and greater accuracy of resemblance. Perhaps we ought to except from this general preference, his "Treaty of Munster," after Gerard Terburgh, which is truly an historical engraving, though it consists of an assemblage of the portraits of the most celebrated statesmen of Europe, and of the age when that important treaty was concluded. The exquisite picture, from which this plate was engraven, which form its rare merits, and its importance as a diplomatic and historical event, ought always to adorn a royal or a national gallery, was lately brought to this country, by Mr. de la Hante, and is probably still in his possession. Not only the person and dress of every plenipotentiary who was present on that memorable occasion, are here portrayed with the utmost delicacy of finish, but the place of meeting also, with every minutiae of costume.

The professional diligence of Snyderhoef was scarcely inferior to his extraordinary merit: this merit has, to a certain

LOW COUNTRIES, ENGRAVERS OF THE.

certain extent, been appreciated through Europe, and fine impressions of his best works are, in consequence, become extremely rare. Mariette's collection of his works amounted to one hundred and eleven: nor are we certain that Mariette had collected the whole. From among these, it may be useful to distinguish the following, as those which are more eminently worthy of the reader's notice.

Portraits.—Maximilian, archduke of Austria, in large folio; Philip III. of Spain, in smaller folio; Albert, archduke of Austria, and governor of the Netherlands; and his duchess, Isabella Clara Eugenia, infanta of Spain, in large folio, all after sir P. P. Rubens; Charles I. of England, and his queen Henrietta Maria; and Francis de Moncada, count of Orsonna, all in large folio, and after Vandyke; the emperor Maximilian I. and his empress Maria, both in folio, and after Lucas of Leyden; duke John, and duke Charles of Burgundy, after Soutman, of large folio dimensions; Aldus Swalmius, an old man with a long beard, from Rembrandt; René Descartes, the celebrated philosopher, from F. Hals; Van Bloemaerts, a half-length, seated at a table, with books and a crucifix; beneath is a long Latin inscription, after Van Spronck; Mark Zucius Boxhornius, of Bergenopzoom, professor at Leyden, from Dabor-dieu; Adrian Heerebond, professor of philosophy, from the same painter; Jacob Maestrius, juris consulte at Leyden, from Van Negre; Andreas Rivetus, professor of theology at Leyden; Claude Saumaize, a famous critic, both from the same master; Noah Smaltius, a celebrated surgeon of Haerlem, after Th. Pas; Albert Kuperus, doctor of medicine at Leyden, after D. Bailly; John Coccejus, professor of theology at Leyden, from De Vos; Constantine, tutor of prince Maurice of Nassau, after Bandrighen; Abraham Heydanus, a shepherd of Leyden, from Schooten; Daniel Heinius, a Dutch historian, from Marek; Anna Maria Schurman, celebrated for her taste and knowledge of the arts and sciences, from J. Livens; John Beenius, theologian, from J. Vliet; Julius de Beyme, professor of law at Leyden; and Pierius Winsemius, professor of history, both without the painter's names, and all of folio dimensions.

Historical, &c. after various Masters.—"The Fall of the Damned," a large upright print, engraved on two plates, from Rubens; "The Virgin Mary, with the Infant Jesus embracing her," in quarto; "A Bacchanal," a small plate, lengthways; "A drunken Bacchus, supported by a Satyr and a Moor," a small upright plate, half figures; "The Chase of the Lions," in large folio, very fine and rare, all after Rubens; a composition of "Satyrs playing with Tygers," the best impressions of which have a forcible and true effect, after De Laer, in large folio; "The Return from a Country Excursion," in large folio, after Berghem; "The Conclusion of the Peace at Munster," containing the portraits of all the plenipotentiaries who were there assembled, a large folio plate, after Terburgh, very fine and rare; "A Quarrel of Dutch Peasants," in large folio, after the same painter; another "Quarrel of Peasants," after Van Oltade, containing many figures; "The four Burgomasters of Amsterdam," a folio plate after Th. Keyser; "Three Old Women regaling," from the same master, in an oval of folio size; "Three Peasants seated, one of whom plays the Violin," a fine and rare print in folio; "Peasants gaming," in folio; "Peasants regaling at the Door of an Alehouse," in folio, all from Van Oltade; "The enraged Drinkers," in large folio, from De Witt; "Peasants quarrelling," in folio; and "Peasants dancing at an Alehouse," commonly called "The Ball," in large folio, all after De Wit.

William de Buytenweg, or Van Buytenweck, was born

at Rotterdam in the year 1605, and always resided in that city. He painted conversational subjects and landscapes. He likewise etched, in a good style, some few subjects from his own designs, of which we are able to mention only the following.

A pair, representing "Young Villagers carrying Poultry to Market;" a set of seven, of "The Costume of Noblemen;" a set of six, of "The Costume of Ladies," all in octavo; and a set of ten landscapes with ruins, trees, and figures, entitled, "Verscheide Landfchapjes." Buytenweg marked his plates either with a monogram, which will be found among those of the engravers of the Low Countries, or with his name at length.

George Henry Scheyndel, or Van Schiendel, was a native of Holland, the contemporary of Buytenweg, and we presume was, like him, established at Rotterdam. He engraved in a very neat, spirited style, very nearly resembling that of Callot. His landscapes possess great merit, and are ornamented with excellent little figures.

Scheyndel marked his prints with his initials G. V. S. We have, by him, "A Company of Peasants, seated before a House Door;" another "Company of Peasants, with a young Pig and Chickens;" "A Dentist, at a Fair;" "The Execution of a Criminal," all in 12mo.; "A Village Fair," in octavo; another "Village Fair, with a Conjuror," of the same size; a winter landscape, with skaters; a landscape, with a water-fall; another landscape, with a bridge, figures, and animals; a set of four views of a cattle, one of which has also a windmill; a set of eleven landscapes, with Dutch inscriptions, all in quarto; a set of the costume of the Grecians and Turks, in octavo; and a set of the habits of the countrywomen of the several cantons of Holland, twelve small upright plates, from Buytenweg.

Peter de Molyn was born at Haerlem in the year 1600. For an account of his merits as a painter, as well as those of his more celebrated son, see the article MOLYN, &c.

Molyn etched some few plates from his own compositions, in a good taste, which are chiefly remarkable for their striking effects of chiaroscuro, and are very much sought after by connoisseurs. A set of four landscapes ornamented with very good figures, in folio; another set of four fine landscapes, with cattle and figures, in large quarto; the star of Bethlehem, with a very fine night effect, and the same subject otherwise treated (though not less successfully,) both in folio; comprise perhaps the whole of his etchings. All, except the last, are marked P. Molyn fecit.; but by some writers the two latter are said to be by J. van de Velde.

This artist marked his engravings with his initials, in the form of a monogram, which will be found in our *Plate III.* of those used by the engravers of the Netherlands.

The works of this artist have been confounded by Strutt with those of his son Peter Molyn the younger, who is better known by his cognomen *Tempesta*.

The younger Molyn was also a native of Haerlem, born in the year 1637, and, according to some of his biographers, was the pupil of Snyders, whose manner of painting he at first imitated.

Either the whirlwind of his violent passions, or, as some have expressed it, his genius, which led him to the study of storms at sea and other dismal scenes, obtained for him the distinctive addition of *Tempesta*: he was otherwise nicknamed *Pieter Mulier*, for a much worse reason, but which still has reference to the ungovernable and tempestuous character of his mind. He caused his wife to be assassinated, in order that he might be at liberty to marry a young lady of Geneva, with whom he was passionately in love.

However villainous this crime, and however incompatible

with the pursuits of art, Molyn stands convicted of the full amount of its enormity. He was discovered, seized, imprisoned, tried, and capitally condemned. The greatness of his merit, however, as an artist, caused his sentence to be mitigated. He ransomed his life with the loss of his liberty, endured an imprisonment of sixteen years, and in all probability would have ended his days in captivity, but that the bombardment of Genoa by Louis XIV. afforded him an opportunity, which he failed not to embrace, of escaping to Placentia.

During his confinement, he consoled himself with his professional pursuits, and probably executed some of the engravings which have been ascribed to him. Of these we are only able to particularise one which is in a style resembling that of the elder Molyn and John van de Velde, the subject is a masquerade by candle-light, with a sort of mock procession in the back-ground. *Tempesta* died in the year 1710.

Albert Flamen was born in the year 1600, but in what part of Flanders we are unable to say. He acquired some reputation as a painter of landscape and still-life, but from the number of excellent prints he produced, is better known as an engraver. At one period of his life he resided at Paris.

His prints are for the most part etchings, performed in a masterly and spirited style, and finished with small assistance from the graver. They are marked with the monogram which may be seen in our *Plate III.* of those used by the engravers of the Low Countries, and consist principally of four sets of various fish, with landscape back-grounds, of sea-ports, &c. engraved on forty-eight plates; a set of seven landscapes and figures; a set of four views of Conflans, Pernay, Marcoussis, and the Port à l'Anglois, all in large quarto; and a folio print of the encampment at the Faubourg de St. Victor.

Claas, or Nicholas, Wieringen, was born at Haerlem some time about the commencement of the seventeenth century. He was sent to sea in his youth; employed much of his time in studying marine objects; and after making a few voyages, settled on shore, and became a painter and engraver of shipping and other marine subjects.

His prints consist of etchings which display much talent and feeling for art, and the subjects of which are sea views and landscapes, either drawn from nature or engraved from his own compositions; a set of six landscapes of village scenery, with rustic figures, &c. in quarto, are very excellent plates, and are all we are able to specify of the works on copper of this master.

Contemporary with Wieringen was Claas, or Nicholas, Moojaert, or Moeyaert of Holland, the happy imitator of Elshiemer, and the instructor of Berghem. Vander Does, Koningh, and Weenix. The name of this artist has been variously spelled, and his history is obscure; Bassan first calls him Nicolas Moojaert of Amsterdam, and afterward Claas Moyard, a Dutch painter.

He etched several plates in a style bearing some resemblance to that of Rembrandt, and as far as is known, worked entirely from his own compositions. Among his best prints are a set of six plates of animals, etched in apparent imitation of Swaneveldt; "Lot and his Daughters," in that of Elshiemer, and a landscape with cows and sheep, of various quarto dimensions.

Christian Louis Moyart was a native of the Netherlands, the time and place of whose birth are not known, but who was residing and practising engraving in the city of Amsterdam in the year 1630.

Among a few other works of no very extraordinary

merit, he produced a set of monstrous allegorical compliments, of folio dimensions, wherein Hercules and Minerva appear quite out of their element, and which is entitled "An emblematical History of Queen Mary de Medicis." Moyart marked his plates with a monogram which will be found in our *Plate III.* of those used by the engravers of the Low Countries.

Mathew Montagne, otherwise Plattenberg, was born at Antwerp in the year 1600, and died at Paris in 1666. He went at an early age to Italy, and made a long stay at Florence, where he engraved in concert with his countryman John Affelin. From thence he journeyed to Paris, where, for reasons which we are unable to state, he changed his name from Plattenberg, to Platemontagne, and afterwards to Montagne. He painted shipping, sea-views, and landscapes, in a very good style, and acquired great reputation.

Montagne likewise etched some few plates of landscapes and sea-views, from his own pictures, in a style resembling that of Fouquieres; of which the principal are as follow; a landscape with buildings and figures; a sea-port, with vessels and figures, both of folio size; a pair of circular prints, one representing vessels on the sea, and a light-house on a mountain; the other a landscape with wood and water; a pair of landscapes, one of which is ornamented with figures cutting wood; the other a canal with watermen, and a village, all in folio; and another pair, one of which has a village, trees, and three small figures on the fore-ground; the other consists of ruins and trees, without figures, in quarto; they are all marked M. Montagne in. et fec.

Nicolas Montagne, the son of Mathew, was born in the year 1631, and died at Paris in 1706. He studied painting under Philip Champagne, to whom he was related; and engraving under Morin, whose style he improved upon. He painted portraits and history with success, and in 1681 he was chosen professor of painting of the Royal Academy at Paris. The most considerable work he engraved was a set of portraits, on which we find his name inscribed, Nicolas de Platemontagne. He drew the human figure very correctly, and his plates possess a very agreeable effect; we shall mention the following only, "Oliver de Castella," a lieutenant-general, killed at the siege of Tarragone in 1644, in large folio; "St. Genevieve," a whole length figure, after Ph. de Champagne, in folio; and "A dead Christ," after the same painter; the figure is finely drawn, and the flesh executed with dots only, but the back-ground and drapery are finished with strokes in a bold and free style, and is altogether a print of considerable merit.

William Akersloot was born at Haerlem soon after the commencement of the seventeenth century. Under whom he studied is not known, nor are his works entitled to rank above mediocrity.

He engraved portraits and historical subjects, and among others the following; Frederic Henry, prince of Orange, in folio; Amelia, princess of Orange, between her daughters, with a castle and figures in the back-ground, both after A. van der Venne; "Christ in the Garden of Olives," after H. Hondius; "Christ loaded with Chains," after P. Molyn; "The Denial of St. Peter," after the same painter; and a large cartouche, with vessels on the sea, all in folio.

Moses Uytendroock, surnamed Little Moses, was born at the Hague in the year 1600. It is presumed he was the disciple of C. Poelenbourg, in whose style he composed, and sometimes so exactly imitated him, that his pictures have been fold for the works of that artist. He painted landscapes, which he usually embellished with subjects taken from the Greek and Roman poets. We have by this master many

many engravings of landscapes from his own compositions, they are executed in a tasteful spirited style, but the figures which he sometimes introduced are incorrectly drawn. We shall mention the following as being most worthy the notice of the collector: "Diana discovering the Incontinence of Calisto," in 4to.; and its companion, "A Female showing to her Child Tobit blind, seated at the Door of his House," very beautiful engravings; "Hagar in the Desert comforted by an Angel;" "Mercury and Argus," both in 4to.; a set of "The History of Tobit," in four landscapes; a set of six landscapes with historical figures; a set of six landscapes ornamented with buildings, figures, and animals, in the style of Poelenbourg; a set of four with ruins and figures, all of quarto dimensions; three landscapes with various animals, in quarto, nearly square; "The Flight into Egypt," a pastoral and poetic subject, of a shepherd and his flock entertained by a muse; a shepherd and shepherdess taking refuge in a cave, from a violent storm; another pastoral subject, with a shepherd in the antique dress seated, surrounded by animals, all in large quarto; and a folio print of Hercules preventing Cacus from stealing his cows and horses, the figures in which are in the antique style; these two last prints are very rare.

J. G. Bleeker, or Bleker, was born at Haerlem some time about the year 1626. He engraved a considerable number of prints, both from his own compositions and those of other masters, in an intelligent and spirited style.

Bleeker marked his plates in various ways, which has given rise to mistakes, for Heinneken calls him John Gaspar, and Florent le comte, Cornelius; which has led our countryman Strutt into the error of making two artists of the name of Bleeker, one of whom he calls Cornelius, and gives him the monogram, for which see our third plate of those used by the artists of the Netherlands. The following are among the best of his works.

From his own Compositions—A landscape with the meeting of Jacob and Rachael; a landscape, into which is introduced the meeting of Abraham's servant with Rebecca. He has, in this instance, worked upon the etching to harmonize it (especially upon the heads of his figures) with the point of the graver, scratching upon the copper, in a style something like that which Worlidge afterwards adopted; but he has by no means succeeded. "Two Peasants travelling in a Cart;" another engraving of the same subject; "A Carriage stopping before an Inn door, with Horses feeding;" "A Peasant seated, observing a Girl, who is milking a Cow," all of folio size; a landscape with animals; another landscape, with a woman on horseback, both in 4to.; and two others, in which animals and a piping shepherd are introduced, both in folio.

The following are after Poelenbourg.—"Jacob and Laban parting their Flocks;" "The Lyttians attempting to sacrifice to Sts. Paul and Barnabas" both in large folio; and "Christ on the Cross," at the foot of which appears the Virgin and disciples, in folio. three very capital engravings.

The Visschers, whom we now approach, were a very distinguished family of artists, and who, by the number and extraordinary merits of their engravings, have conferred much honour, and no small advantage, on their country.

Cornelius Visscher was born in Holland, A.D. 1610, he was the disciple of Soutman, but soon surpassed him in merit. M. W. let truly says, (in his Dictionary of Engravers,) that very few artists combined etching and engraving with so much taste, or so well imitated with the graver alone, all the playful picturesqueness of the point, as Cornelius Visscher. He drew with great taste, and the compositions which he made for many of his engravings, suffi-

ciently prove the extensiveness of his genius, and his powers of combination. His etchings are free and delicate; but his works with the graver must excite the admiration of every tasteful beholder. His mode of performance with that instrument was as singular, as the effect he produced was picturesque and beautiful. Among the engravings from his own compositions that of "The Rat-Catcher," "The Bohemian Woman," "Gellius de Bouma," and "The Cat," deserve the preference; in the Bohemian, the rough freeness of the etching needle is finely contrasted with the shaving smoothness of the lines produced with the graver. The portrait of Bouma is yet more exquisite and surprising, his old and wrinkled skin being engraved in a manner which is peculiarly characteristic of the laxity and feebleness of the decaying muscles and shrivelling integuments of old age, particularly about the cheeks and temples; the nose (says Huber) appears like flesh itself, and the mouth, which is partly concealed by the beard, seems to be alive, as do also the eyes, the execution of which is beautifully clear, and expressive of the dimmed brightness of a mind which time is eclipsing. The same nice feeling, accuracy of discrimination, and power over the instruments of his art, marks the execution of his celebrated Rat-catcher, in which the shining face as well as negro features and complexion of the young African, are admirably depicted, and the master rat-catcher with his furred cap, and highly characteristic habiliments, rat cage, &c. and, above all, his animated physiognomical countenance, which together mark the profoundest of adepts in the mysteries of his craft, are expressed with that broad and general, and therefore strong, resemblance to nature, which all eyes must have seen, and is finished with the utmost vivacity of touch.

Cornelius was an engraver of truly original powers; he was a man of a self-willed character of mind, and perhaps should not have endeavoured to copy the feelings, and transmute the forms, which had originated in the minds of other artists. It is acknowledged that his engravings after the Italian painters, are of inferior merit to those which are after nature and his own compositions; the plates which were executed for "the cabinet of Reyna," are among his earlier performances, nor did he succeed so well as Vorsterman, Pontius, and the Bollwerts, in engraving after Rubens; yet he claims to be ranked among the first artists of his country, for genius always should be estimated, not by its freedom from defects, but by the dimension of its merits.

Among his best works, the collector may reckon the following; those who would see a more copious catalogue, may consult Baffan's Dictionary of Engravers.

Portraits.—Cornelius Visscher, in a sugar-loaf hat; another portrait of Visscher, with the same kind of hat, and a cloak, both in 4to.; Andrea Deonyfzoon, called among print dealers, "the man with the pistol," because a small carbine or pistol with several gun locks appears in the background; this print is one of the finest, and the most rare, of the engravings of this master, but perhaps the very rarest of all, and certainly the most intrinsically valuable of his portraits, is that of Gellius de Bouma, minister of Zutphen, aged seventy-seven years; William de Ryck, an oculist of Amsterdam; this portrait, and the preceding, are sometimes called "The great Beards," and are uncommonly fine, all of folio size; a bishop seated at a table, with a crucifix, &c. half length; John Merius, the pastor of Spanbroeck, both in large folio; Cornelius Vosberg, the pastor of Spaerwouw, in folio, a very fine and rare print; John Wachtelaer, an ecclesiastic of Utrecht, in large folio; William van-den Zande, theologian, in an oval border; Adrian Motman,

Motman, accompanied by cherubs, a skull, and a censer; John Boelenfz, in an oval border, with "Sanctitate et Doctrina" inscribed on a streamer; Adrian Pauw, knight of the order of St. Michael; David Peiterz de Vries, chief master of the artillery in the Dutch States, very rare; Joshua Vondel, a Dutch poet, half length, all of folio size; Jacob Weiterbaen, lord of Brandwick, &c. half length, in an oval border, octavo size, very rare; Alexander VII. sovereign pontiff, with the motto "Iustitia et Veritate" on a cartouch supported by children; Coppenol, commonly called the writer, because he holds a pen; Peter Scriverius, a philosopher of Haerlem, (of this engraving it is uncommon to meet with a good impression); John de Paefs, holding a purse, and a cartouch, on which is written his occupation of an exchange broker, all in folio; an etching of an old woman, commonly supposed to be the mother of Visscher; another portrait of the same person, with a bonnet on, both of quarto size; Robert Junius of Rotterdam, a clergyman, in an oval border, "Palmidas pinx." in folio; Constantine Huygens, nobleman of Zuylichem, father to the celebrated mathematician of that name, a fine and rare print; a bust of Peter Gassendi, in an octagon border, with Latin verses; both in 4to.; William of Nassau, son of Frederic Henry, prince of Orange; Mary, eldest daughter of Charles I. wife of the former, both in large folio, from Hondthorst; Christiana, daughter of Gustavus Adolphus, and queen of Sweden; Frederic William, elector of Brandenburg; Charles Louis, palatine of the Rhine, and elector of Bavaria; Charles II. of England, all after Hondthorst; Janus Douza, lord of Northwick, and of some celebrity as a philosopher, all of large folio dimensions. And two very rare portraits, which we do not find specified in the catalogue of Heequet, viz. Francis William, bishop of Osnabruck; and Louis Cutz, theologian, both in ovals, of 4to. size.

Historical, &c. from his own Compositions.—"The Four Evangelists," half lengths, with attributes, in folio; "The Pancake Woman," a large folio plate, the best impressions of which are before the name of Clement de Jonghe was affixed to it; the second best, before that of John Visscher. It was afterwards retouched by Bassan, and the name of John Visscher erased; but the last impressions are easily distinguished from the first by their palpable inferiority. "The Rat-Catcher," the first impressions of which were taken before the name of Clement de Jonghe was affixed to it; "The Bohemian or Gypsie Woman," with three children, to one of whom she gives the breast, all in large folio; the name of Visscher, in the earliest impressions of the latter plate, is upon the margin at the bottom. It was afterwards obliterated to make room for the inscription, and affixed to the upper part of the plate; "The Interior of a Cabaret," with a party of five men smoking and drinking, in folio; "The Antiquary," representing an amateur, in his cabinet, looking over his curiosities, in large folio. By some this is mistakenly said to be from a picture by Reynil, and others attribute it to Correggio. Charles Gustavus, king of Sweden, and his queen, accompanied by a great crowd of persons, and an old man reading a paper; "The Coronation of the Queen of Sweden," inscribed "Carolus Gustavus:—Hedwig Eleonora;" all of large folio size; a boy holding a candle, and a girl with a mouse trap, in which is a mouse; this print is usually called "The Mouse Trap," in 4to. A figure lying on a tomb, above which Christ appears with cherubs, beneath is a bas-relief with two genii placing a serpent on a skull crowned with laurel; above is inscribed "Fortiter, fed suaviter," in large folio. A cat sleeping, with a rat before her, in 4to; a cat sleeping upon a napkin, a very small plate lengthways. This print is exceedingly rare, and at the auction

of Mariette's collection, it sold for the sum of three hundred and sixty-one livres.

Historical, &c. after various Italian Masters.—"The Angel commanding Abraham to quit his Country, and sojourn in the Land towards which he points," from Bassan; "Abraham at Sichem, and God appearing to him in a Dream," from the same painter; "Sufannah and the Elders," from Guido. The bust of a woman with her hand upon her breast, a very fine print, thought to be from Parmegiano, all in folio; "Christ carried to the Tomb;" "The Resurrection," after P. Veronese, inscribed "Ego et Pater meus sumus," in large folio; "The Holy Family," where the infant Christ is on the lap of the Virgin, and St. John presents fruit; thought to be from Palma; "The Holy Family," in which the infant Christ is playing with flowers on the lap of his mother, and in the back-ground is Tobit brought by an angel; and another "Holy Family," where St. John presents a pear to the infant Christ, both without the painters names, and all of folio dimensions.

Subjects from Flemish Masters.—"The Last Judgment," after Rubens, a fine engraving, on two large folio plates; "The Holy Virgin and Infant Christ surrounded by Angels," after the same painter, in large folio; "St. Francis d'Assise receiving the Infant Christ from the Virgin," in large folio; "Achilles discovered by Ulysses at the Court of Lycomedes," in large folio. At the time Visscher engraved this plate he was under the direction of Soutman. A boy lighting his candle from that of a woman with a basket, in large quarto; all from Rubens. A man playing the violin, accompanied by five children, from Van Oltade, a very fine engraving, of which it is very difficult to find a good impression. An etching of the same subject, marked "A. Van Oltade pinx. C. Visscher fecit. aq. a. forti." The interior of a smoking-room, with six men, a woman, and two children; all in large folio. The best impressions of this plate are before the names of Visscher and Oltade were inserted. A smoking-room, with two men and a woman drinking; a man and woman in a public house, on whose faces drunkenness and vulgarity are depicted most admirably; both from Oltade. A party of five men in an alehouse, one of whom plays the violin, whilst the others sing, from Ad. Brouwer, both in folio. A surgeon performing an operation on a man's foot, in folio; from the same master. Three very fine prints, after P. van Laer; viz. 1. The pistol-shot, or the coach robbed; in folio. 2. An attack on a convoy. 3. The lime-kiln; both the last in large folio. A party of hunters on horseback, with hounds, &c. from P. de Laer; and its companion, a man seated on the banks of a river, in which women are washing. A landscape with a moonlight effect, which exposes two robbers making off with their booty, after having knocked down a man; and its companion, a rural subject of a man and woman tending sheep, both in large folio, from de Laer; and two sets of four folio plates, each after Berghem, of which the subjects are landscapes, adorned with ruins and rustic figures.

The merits of John Visscher, as an engraver of landscape, cattle, and rustic figures, were not less original and extraordinary than those of his brother Cornelius. He was born at Amsterdam in the year 1636, and has been spoken of as a painter as well as an engraver. His pictures we have not seen, and his engravings alone are sufficient to entitle him to the fame he so justly enjoys.

With artist-like regard to the demands of the class of subjects which chiefly engaged his abilities, a much larger portion of his engravings is performed with the etching-point than in those of Cornelius, which instrument he handled

with the utmost freedom and picturesque playfulness. Berghem, of whom we shall presently speak, and of whom we have treated in vol. iv. was a pastoral painter, and no man to this hour has translated the poetry of Berghem's painting, with more success than John Visscher, unless Laurent, an English engraver, who died young at Paris, might be excepted.

Trees, especially those of thorny-charactered foliage, such as Berghem painted; broken ground; the rough sides of cattle, in all their wild varieties; mossy rocks, and the crumbling surfaces of ruined edifices, he treated with singular feeling and felicity, blending a painter's and almost a naturalist's knowledge of the details of the forms of such objects, with an engraver's taste and manual power of execution. Shallow brooks, in which, disturbed by fording cattle, the sunshine glitters, as long as prints can be preserved, will continue to sparkle with the merits of Visscher, while his deeper streams and lakes reflect the meridian glow of his reputation.

Middiman, as well as many other modern engravers, appear to have formed their styles of etching grassy ground, and rocks patched with lichens, from contemplating the prints of this master, and no man better than he imparted truth of character and animal expression to cows, horses, asses, goats, sheep, and all the various tribes of domestic animals which his great master Berghem delighted to paint, and therefore painted so well; or displayed on paper with a reader hand the rusticities of Ostade.

The portraits of John Visscher, which we shall commence our list of his superior performances, shew that he occasionally handled the graver with scarcely less freedom and taste than the etching-needle.

Portraits.—John de Witenbogaert, from a drawing by Visscher himself, in quarto; Peter Proclius, a minister of Amsterdam, after Van Noort; Thadeus Lautman, pastor of La Haye, after J. de Bane, both in folio; Abraham vonder Huilt, vice-admiral of Holland, in large folio; Petrus Paulus Rubens, an etching from Vanduyke; Michael de Ruyter, admiral of Holland, H. Berckmans pinx.; both in folio; a man with his hair dressed, after C. Visscher, in quarto; and a negro shooting an arrow from a bow, after the same master, in folio.

After Ostade.—A company of peasants under a trellis-work, gaming; "Rustic Economy," where a man is winding off cotton, and his wife spinning it; "A rustic Party," composed of two smokers, and an old woman and child; "Peasants rejoicing;" "A Skirmish before the Door of a Tavern;" "A Peasant's Wedding," inside of an alehouse; and a drunken peasant putting his hand on the bosom of a woman, all of folio dimensions.

After Berghem.—Several peasants dancing in a cottage, commonly called "The Ball," in large folio; a beautiful landscape, ornamented with figures and animals, and its companion, a mountainous landscape, with a man and horse travelling; "Summer," in large folio; a landscape, with a man clad in goat's-skin, on horseback, in folio; and its companion, a girl milking a goat, in a landscape; and a pair of pastoral subjects, in one of which is a shepherd meditating, in the other a woman milking a goat, and a piping shepherd. The four parts of the day, Aurora, Meridies, Vesper, and Nox, beautiful landscapes, in large folio. A set of four large folio etchings of landscapes, in which the figures introduced are; 1. A man on a mule. 2. A woman. 3. A shepherd guiding his flock. And 4. A mule loaded with pease-hens. A set of six landscapes; 1. Men shoeing an ass. 2. Two women and a dog, one of whom is carrying a flock. 3. A shepherd on an ass, driving his sheep.

4. A woman carrying faggots, and a peasant on horseback. 5. A peasant on an ass leading a cow. 6. An old man with a beard, sitting against a wall, in folio. A set of four, the title-page of which is a monument or tomb. 2. A shepherd playing the bag-pipes. 3. A shepherd and his dog fording a brook. And, 4. A boy carrying faggots; in folio. Another set of landscapes, of which the title-page is a fountain or watering-place for cattle, with a woman milking a goat. 2. A shepherd wrapped in his cloak, with a sick. 3. A shepherd seated on a lullock, and another in pastoral conversation. 4. A woman on an ass, and a girl standing beside her; all in folio. Four other sets, of various number, of landscapes, with similar rustic figures introduced; all of folio dimensions. And the ornamental decorations of various geographical charts, for which Berghem supplied the designs.

From other painters of cottage scenery, he engraved a set of eight prints of figures and animals, after H. du Jardin; a set of four large folio prints, after P. de Laer, which have been attributed by some to Cornelius Visscher, though with better foundation, by others to John. They consist of 1. A party of beggars playing at cards, surrounded by a crowd of spectators. 2. A woman on horseback guiding cows, near whom is a man who has dismounted to drink out of his hat. 3. An hostler busied at an inn-door; near which is a stable with horses feeding. 4. A forge, with a man shoeing a horse, and others conversing.

After P. Wouwermans.—A victualling tent, and horsemen stopping to drink; another victualling-tent, with men carousing; horsemen diverting themselves before their tents, and, as usual in the compositions of Wouwermans, a white horse with trappings; all in large folio. A set of four in folio, of 1. The marshalling of an army, with a horse on the fore-ground. 2. A victualling tent. 3. A party of travellers. 4. A riding-school.

A set of twelve after G. van Goyen, of landscapes and sea-pieces, enriched with various buildings and figures, in quarto; and another set of twelve wild landscapes, and marine subjects in Italy, after Herman Swaneveldt, which are very interesting, and adorned with figures; must conclude our list of the works of this meritorious artist.

Lambert Visscher, the brother of Cornelius and John, was born at Amsterdam in the year 1634, and died at Rome, whither he had travelled for improvement or employ, and where he engraved in conjunction with Bloemaert, Spierre, and others, from the pictures of Pietro da Cortona, in the palace of Pitti, at Florence. He engraved both portrait and history, working with the graver alone, but did not possess any very great share of merit. The following are a selection of the best of his productions.

Portraits.—Stanislaus Lubienitz, M. Scheitz pinx.; J. In Rutgerlius, counsellor of Guittayus Adolphus, both of quarto size; Christopher de Kannenberg, privy counsellor to the elector Frederic William of Brandenburg; Maria Theresa of Austria, queen of France, from Van Loo; all in folio. Charles Rabenhaupt, baron of Sucha, and lieutenant-general of Holland; John de Witt, the distinguished pensionary and patriot of Holland; and Cornelius Tromp, vice-admiral of Holland, F. Bol pinx.; all of large folio dimensions.

Historical, &c.—"The Generosity of Silienus to Antiochus," from P. da Cortona; and "Virtue delivering a young Man from the Embraces of Voluptuousness," in large folio, from the same painter.

Nicholas John Visscher was of the same family as the preceding artists, and born at Amsterdam some time about the year 1580. We have by him a considerable number of etchings, executed in a free agreeable style; he particularly

succeeded in small landscapes, with figures and animals. He likewise engraved a few portraits, which he marked with his name at length, or sometimes with a monogram, composed of C. and V. for Claus or Claas, being the Dutch abbreviation of Nicholas, and which will be found in *Plate III.* of those used by the engravers of the Low Countries.

The following of his engravings are most worthy the attention of the collector. William Laud, Archbishop of Canterbury; Charles I. of England, in a large round hat, both in 4to.; John Calvin, in folio; Didier Erasmus of Rotterdam, from Hans Holbein; James II. of England, and James, duke of Monmouth and Buccleugh, both in large folio.

Etchings.—"The Table of Cebes," an allegorical subject on human life, in large folio; "The Execution of the State Criminals, of the Sect of Arminians, at the Hague," in folio; two landscapes with Dutch castles, in large folio; and a view of the castle and environs of Lovensleyn, which was used as a prison. At the bottom of the print is a perspective view of the castle in the form of a frieze; and on each side a medallion. This is a folio print, very rare, and beautifully executed.

Peter Nolpe was born at the Hague, A. D. 1601. The circumstances of his life are rather obscure, but his works prove him to have been a man of talent. He is spoken of as a painter; but apparently his engravings are far more numerous than his pictures. He worked with the point and graver, and generally united them; but some of his plates are executed with the graver only, which instrument he handled with much more facility than taste. He engraved portrait, history, and landscape, but excelled most in the latter, for he was but imperfectly master of the human form, whereas his landscapes possess a certain air of boldness and freedom, which manifest a practised hand, though not a mind of profound information.

The most valuable of his works are the portraits of John Adler Salvius, a minister plenipotentiary to the court of Sweden, in 4to. A set of eight horsemen, in 8vo.; very rare etchings. A set of eighteen etchings of beggars, in 4to. after Quast, of whom we shall speak anon, and treated in his manner. "The Angel delivering St. Peter from Prison," after J. V. Vucht, in folio; "Judah and Tamar," in a landscape of large folio size. The same figures he afterwards introduced into a landscape of a much smaller scale. "An Inundation," occasioned by the bursting of a water-bank. This is a very scarce print, executed with much force. "Daniel in the Lion's Den," after Blanchard; "The Voyage of his Majesty, the King of Great Britain, to the Coasts of Holland." An emblematical print on the marriage of the prince of Orange, with the princess Mary of England. A set of six landscapes, after Van Nieulant. Six ditto, which are esteemed beautiful, after Rogman, all in folio. The remainder are of larger folio dimensions. A view of the guard-house at Amstel, near Amsterdam; eight of the months of the year, which are very beautiful, with fine effects. A set of the four seasons; another of the four elements, from Peter Potter; "The Prophet Elias, with the Widow of Sarepta;" "St. Paul the Hermit fed in the Wilderness by an Eagle," both in large folio; and a very capital print, engraved on five plates, after C. Molyn the younger, of "The Cavalcade made by the Citizens of Amsterdam, on the Entrance of Mary of Medicis;" some of which he marked with a monogram which is copied in *Plate III.* of those used by the artists of the Netherlands.

Peter Quast. There is a certain fanciful quaintness about this artist, of a diverting kind. The grotesque quirks of his morrice-dancing beggars are perfectly homogeneous with

the twirling Q's in his various monograms, and makes us anticipate something entertaining in the history of his private life, of which alas! we know nothing, but that he was born at the Hague in the year 1602, and was the intimate friend of Nolpe, whom we have just dismissed.

He designed and engraved groups of peasants, battles, beggars, and barbers' shops, and even in his battles there is something allied to drollery. His talents, in many respects, were but little inferior to those of Callot, with whom he was contemporary, and to whom, in the management of his tools and style of engraving, he bore a remarkable resemblance.

The monograms of Quast may be seen in *Plate III.* of those of the engravers of the Netherlands, and his principal works, are, "Fyf limen te Koop," (or the five senses) in octavo, dated 1638; the four seasons, personified by grotesque figures, in quarto. A set of twelve plates of Capriccio and grotesque figures, in 8vo. Another set of Capriccio, of which the subjects are beggars, old women, and oddities, supercribed on the title page "Tis all ver-vart Gaeren;" this set consists of twenty-six plates in 4to. Another set of ten quarto plates of beggars, with quizzical names and corresponding landscape back-grounds; and a set of twelve plates in 4to. of whimsical modes and fashions, in the taste of the noblest of Callot.

Francis Vander Steen was born at Antwerp, A. D. 1604, and having in his youth lost the use of one of his legs by an accident, his parents thought of fine art as a profitable or pleasant occupation; and if a correct judgment may be formed by his success, most probably the former; for he obtained high patronage, though he possessed not much merit. The archduke Leopold assigned him a pension, which was continued by Ferdinand III.

His engravings, however, of which the following are the chief, find their way into the portfolios of those who collect the productions of this school, either on account of their subjects or supposed merits.

Portraits.—Cornelius Cort, in 8vo.; Theodore Coornaert, in 4to., both celebrated engravers; Andrea del Vaux, or Vallenis, professor at the academy of Louvain, in 4to.; and George Sebastian Lubomirski, count of Wisnietz, Herdt, del.; in folio.

Historical, &c. after various Masters.—"The Holy Family," where the infant John presents flowers to Christ, from Titian; "The Holy Family," with St. Joseph seated on a sack. This subject is called in Italy "La Madonna del Sacco," from Andrea del Sarto, and has since been engraved by Bartolozzi and by Raphael Morghen. "The Dream of Michael Angelo," from Michael Angelo; "Soldiers playing at Cards," from Manfredi, all in folio; "A Man holding a Flaggon and a Cup, in company with another Man," in 4to.; "A Peasant seated, reading the Newspaper, whilst an old Woman caresses him with one Hand and holds a Pot of Beer in the other;" "A Village Party," of quarto size; "The Miser and his Wife counting their Gold," in folio, all after Teniers; "A drunken Silenus supported by Satyrs and Bacchanals," from Vandyke; "A Cupid forming a Bow from the Club of Hercules," after Correggio, in folio. At the bottom of the print are two children, one of whom cries and the other laughs. "Jupiter and Io;" "The Rape of Ganymede." These three engravings are very rare, from the pictures of Correggio in the gallery of Vienna, and at the sale of Mariette's collection were sold for two hundred and fifty livres. "The Martyrdom of eleven thousand Virgins," engraved on four plates from the drawings of Van Hoo, after the original pictures by Albert Durer; "St. Pepin and St. Begue," half-length figures on the same plate,

plate, from drawings by Rubens, after the pictures by Van Eyck; and the portico of the picture gallery at Brussels, commonly called "The Gallery of Teniers," from Van Hoy, all of folio size.

Hans or John Witdoeck, Withouck, or Witdouck, was born at Antwerp, A. D. 1604. He was among the number of artists who enjoyed the friendship and instructions of Rubens, and seems to have entirely devoted himself to engraving the pictures of that great master. Witdoeck did not well understand the human figure, for the naked parts are but indifferently expressed, the extremities are heavy, and the markings of the joints are not properly determined. Neither is the mechanical part of his engraving less exceptionable. It proves that he had very little command of the graver, or did not sufficiently study that part of the art to produce a clear and agreeable effect. Notwithstanding these faults, Bassan has praised him, and the prints which he executed under the eye of Rubens in chiaroscuro, possess a tolerable effect.

The following engravings from the hand of this master, are those which are most worthy the notice of the collector. A pair of bulls of "Cicero" and "Demosthenes," in folio; "Melchizedeck presenting Bread and Wine to Abraham and his Followers;" "A Nativity," both in large folio, from Rubens. This latter plate underwent several alterations, chiefly to add to the effect. The first impressions are without the address of Corn. Coeberch, the second have the address; after which the plate came into the hands of S. Bolwert, who engraved on, and improved it very much. He effaced the name of Coeberch, and inserted his own. "The Adoration of the Kings," in large folio, from Rubens. This print likewise underwent several alterations in the effect. "The Elevation of the Cross," a large print lengthways, from Rubens, on three plates; "Christ at Table with his two Disciples at Emmaus," a large folio plate, nearly square. There are some few impressions of this plate, with the addition of a tint from a wooden block; but these are very rare. "The Assumption of the Virgin," a very fine and rare print, in large folio, of which those impressions that are marked C. Van Molen are retouched. "The Virgin and Infant Christ," in an oval border; "The Holy Family," where the Virgin is represented suckling the Infant Jesus. The best impressions of this engraving have the address of Moermans. Another "Holy Family," here the Holy Infant is represented asleep on the bosom of his mother, all of folio size; "St. Ildefonso receiving a Chasuble from the Holy Virgin," a very fine and rare print, in large folio; "The beheading of St. Justus;" and "St. Cecilia," both in large folio, and all after Rubens.

After *Cornelius Schut*.—"Judith and Holofernes;" "The Holy Family;" "The Virgin on a Crescent;" "The Virgin seated in a Landscape, surrounded by Angels;" "The Virgin and Christ, accompanied by St. John and Angels," all in folio; and "St. Nicholas appearing to the Emperor Constantine, and delivering three Tribunes from Prison," in large folio.

Remoldus, or Rombaut Eynhouedts, was born at Antwerp in the year 1605, in which city he always resided. His plates are executed with a firm dark point, and in a style which he had the art of varying and adapting to those of the several painters after whom he engraved. His drawing, though not always equally correct, is very spirited, and his masses of light and shade very well preserved. His principal engravings are after Rubens and Schut, but he likewise engraved some subjects for "The Cabinet of Teniers."

We shall specify the following from the hand of this artist:

VOL. XXI.

"A dead Christ," after Palma the younger; "Christ rising from the Tomb," after the elder Palma; "The Adoration of the Kings," after Rubens, very rare; "The Resurrection of Christ," from the same painter; "The Fathers of the Church," and "St. Clare holding the Holy Sacrament;" all of folio size. "The Virgin seated, surrounded by Saints;" "The Chapel where Rubens was entombed," in 4to.; "St. Gregory, between Prudence and Courage, leaning on a Staff;" above is a picture of the Virgin and Christ, and angels holding wreaths of fruit, after Rubens, in large folio. "St. Christopher," in folio, after the same painter; "St. Peter" and "St. Paul," in folio; "Cambyfes, King of Persia," who having ordered an evil judge to be slayed alive, caused his skin to be spread upon the seat of justice, and placed the soul of the culprit upon it, making him judge in his father's stead: a small square plate. "Peace and Happiness," Peace is crowned by Victory, and is supported by Power and Justice, accompanied by other allegorical figures, all after Rubens; "St. Ann," in folio; "The Assumption of the Virgin;" and "The Martyrdom of St. George;" both in large folio, after Schut.

Peter Clouet, Clowet, or Clouvet, was born at Antwerp, A. D. 1606; he learned the elements of art in his native country, and afterwards went to Italy for improvement, where he studied under Spierre and Bloemaert. He returned by way of Paris, where he remained and exercised his profession for some time, but finally settled at Antwerp.

He worked entirely with the graver in a clear firm style, not a little resembling that of P. Pontius. His prints are generally deficient in middle tints, and therefore in harmony, and though full of colour, and boldly engraven, from too equal a distribution of the shadows, and the lights being too much scattered, they lose a great part of their effect. However, his prints, especially those after Rubens, are much sought after. He exercised his art both on portraits and history; and the following is a selection of his most meritorious engravings:

Portraits.—Peter Aretin; Nicolas Coffin; Thomas à Kempis; Ferdinand Cortez; Amerigo Vespucci; and Francis de Malherbe; all of quarto size, and without the names of the painters. Michael Boudwys, a physician of Antwerp; William Cavendish, duke of Newcastle, on horseback, both in folio, from Diepenbeck; Christopher Vander Lamen, a painter of Antwerp; Theodore Rogiers, a goldsmith of Antwerp; Charles Scribanus, a Jesuit of Antwerp; Ann Wacke, holding a plume of feathers; and Henry Rich, count of Holland; all after Vandyke, in folio.

Historical, &c. after various Masters.—"The Descent from the Cross," from Rubens, in large folio; "The Epitaph of Rubens," in folio; "The Death of St. Antony," a fine and rare print, in large folio; "St. Michael vanquishing the Devil," in folio; "A Conversation between several Lovers in a Garden:" the best impressions have Flemish verses beneath, but those with French are likewise much sought after. This conversation piece is a very fine and rare print, in large folio. A standing female figure, in folio; a winter scene, with a cottage, and the snow falling, belonging to a set of six, the other five of which were engraved by S. Bolwert, all after Rubens. "The Virgin suckling the Infant Christ," after Vandyke, in large folio; and "A Party at Table," where the master and mistresses are crowned with laurel; "The Family of the Duke of Newcastle," after Diepenbeck, in folio.

Albert Clowet, or Clouet, was born at Antwerp in the year 1624. He was nephew to the preceding artist, and went to Italy to study under C. Bloemaert. During his residence at Rome he engraved a considerable number of

LOW COUNTRIES, ENGRAVERS OF THE.

plates, and among them several of the portraits for the *Lives of the Painters*, by Bellori, which were printed in that city, A.D. 1672. He always worked with the graver in a neat style, imitating, in his historical works, with tolerable success, that of C. Bloemaert. His portraits are sometimes in the style of Mellan, at others in that of F. de Poilly, and sometimes in that of Nanteuil; though by no means equal in merit to the works of those great masters, either in drawing, effect, or mechanical execution.

Among various other *Portraits*, he has executed a collection entitled "*Effigies Cardinalium viventium*," which were published at Rome by J. Rossi. The following are likewise by him.

Nicolas Poussin; Antony Vandyke; the cardinal Azzolinus, from Vouet; cardinal Jacob Rospigliosi, from J. M. Morandi; cardinal Charles Rosetti; cardinal Francis William de Wartenberg; Maximilian, count of Wolfegg; and the medallion of pope Alexander VII. supported by the cardinal virtues; all of quarto dimensions.

Historical, &c.—"St. John de la Croix," the first instructor of the order of Carmelites; Lazaro Baldi, *prix.* in large folio; "The Statue of the Happy Umiliana," after a drawing by Baldinucci; "The Sepulchral Monument of Pope Paul III." from Dom. Barriere, both in folio; "The Obelisk placed on an Elephant, erected on the Place of Minerva," after G. L. Bernini, in large folio; "The Mysterious Conception of the Virgin," after P. Cortona, engraved on two plates, very fine and rare; "A Combat of Horse-Soldiers," after Jac. Courtois; and a large print, engraven on four plates, of "The Battle of Joshua," after William Courtois, brother to the preceding artist.

A much more extraordinary artist is now to be introduced to the reader's notice. Of wild, vigorous, and original powers, both as painter and engraver, Paul Rembrandt Gerretz, or Van Rhyn, gave a new impetus to art, and effected a revolution in taste, of which the effects will long continue to be felt.

The professor Fuseli, by a grand metaphor, which speaks whole pages in praise of the talents, powers, and influence of our artist, says, that the frantic pilgrimage of painters to Italy ceased at the apparition of the two meteors of art, Peter Paul Rubens and Rembrandt Van Rhyn. Both Fuseli and the professor Opie (who was too soon, alas! lost to his country) have justly estimated and deservedly praised the merits of Rembrandt as a *painter*, and they will doubtless be not less faithfully reported in this work, when the writer, to whose pen is confided our biography of painters, shall arrive at his name. In this place he will be treated as an engraver; yet if the present writer should any where be thought to trench on the province of painting, let it be recollected, that of two arts so intimately connected as painting and engraving, and which call forth and exercise the same energies of mind, how difficult, how almost impossible it is, to write separately and to write well.

Rembrandt was the son of Herman Gerretz, a miller of the neighbourhood of Leyden, and was born A.D. 1606, in his father's mill, which stood on the banks of the Rhine, between the villages of Leyerdorp and Koukerk. A spot which became interesting from being the birth-place of so great an artist as Rembrandt, became doubly interesting when brought to our view by the magic of his pencil. A picture of this mill, which was once in the Choiseul Collection, is now in the gallery of William Smith, esq. M.P. for Norwich. It represents a very early hour of morning, and perhaps the figures which are introduced may have other local allusions, of which the meaning is now lost, to the time and circumstance of his birth.

Finding that he possessed an enquiring and capacious mind, Herman sent young Rembrandt to the college at Leyden, where his reigning passion for fine art, and his disinclination for all other studies, were soon manifest. Other masters were accordingly provided to instruct him in the elementary principles of art; and Rembrandt studied successively under Van Scootens, Peter Lallmann (an engraver of whom we have already treated), James Penas, and James Van Zwannenburg.

How a man of so great genius came to seek instruction from so many masters, it were difficult to say, and still more difficult to think that they did not encumber his progress: but, perhaps, to the variety of their advice, we may in part owe the originality of Rembrandt. He did not, probably, remain long enough under the direction of any one of them, to trammel his habits, or overwhelm or stultify those feelings and perceptions of nature, which are the genuine and free inlets to lofty and original attainments in art.

Hence Rembrandt has been compared to Shakespeare; and hence, like another wild poet whom "*Leyden aids no more, with many-linguaged lore*," and who voluntarily

"——— leaves the lofty Latian strain,
Her stately prose, her verse's charms,
To hear the clash of rusty arms;"

he allowed that the ancients were "pretty fellows in their day," but would point with sarcastic air to the walls of his study, which were hung round with suits of armour, rich stuffs, and the picturesque dresses of various ages and nations, and say "these are *my* antiques."

Both Rembrandt and his wife have been accused of an over-weening fondness for money. She sold his engravings that he might not be interrupted in his professional pursuits; and understanding the "tricks" of print-sellers, was too much of a "traveller" to allow herself to be imposed upon by them. It is said that a considerable fortune was thus acquired, which devolved to an only son, Titus, to whom nature was as niggardly in her gifts, as she had been prodigal to the father. The mean propensities of Titus have been mentioned, and his inability to avail himself of his father's instructions in art; but the amount of his fortune has never been stated, and has probably, by unreflecting readers, been much over-estimated.

One of the most valuable paragraphs in Strutt's Dictionary of Engravers, is that which he has written on the prints of Rembrandt; because while it describes their merits with the fellow feeling of an engraver, it marks the difference, which cannot be too strongly marked, or too often repeated in the public ear, between mere rarity and intrinsic worth; the want of which discrimination, more, perhaps, than any other cause, has been the bane of engraving; retarding its progress, by keeping us too intent upon nominal and extrinsic value, and too regardless of those intrinsic qualities, which, as men of taste, should alone engage our attention.

He says, "His prints, which are partly etchings, and partly engravings, performed with the graver in a singular manner, have all that freedom of touch, spirit, and greatness of effect, discoverable in his paintings, supposing them to be assisted by the variety of colours. Considering the great quantity of etchings he made, we cannot suppose they should be all equally well executed, or equal in value. However, (according to the common course of things, on which an imaginary value may be raised by accidental causes,) they are not always his best prints which produce the greatest prices; but those that are the scarcest. Thus we frequently see a print of great intrinsic worth in itself, if considered

considered as a beautiful specimen of the abilities of an artist, thrown aside for no other fault than that of being too easily obtained; whilst another, which perhaps is rather a disgrace than an honour to him, is purchased at an extravagant price, and anxiously preserved because it is unique. It is merely owing to this caprice, that so many trifling alterations in the prints of Rembrandt, rather than a proper examination of their real merit, increase or diminish the worth of the same print. I myself, commissioned by an eminent collector, gave six-and-forty guineas for the great Coppenol, with the white back-ground, that is, before it was finished; when, the same evening, at the same sale, I bought a most beautiful impression of the same print finished, distinguished by having a black back-ground, &c. which had an address to Rembrandt at the bottom, written by Coppenol himself (for he was a writing-master of Amsterdam, and this print is his portrait,) for fourteen guineas and a half. In the second instance, I exceeded my commission by the half guinea; in the first, I did not reach it by nearly twice ten guineas. It cannot be reasonably supposed, that such a difference could exist between two good impressions of the same plate; and, speaking as an artist, I should certainly have taken the last in preference to the first."

The "singular" manner of which Strutt speaks, appears to have been shrewdly guessed at by Watelet and Barthelemy, who say, that "it would be difficult to discover the way in which Rembrandt worked: he certainly made great use of the dry point, which he sometimes scraped but slightly, and the burr partially stopping up, or blending with the lines, resembled a wash," yet possessed more warmth and richness. The dry point which Rembrandt used was either, as Strutt has supposed, the point of a graver, or it was such a dry point, as has since, in our own country, been much used by Worlidge, namely, cylindrical steel wire, whetted to a triangular point.

But the great wonder of his art, as an engraver, is his chiaroscuro. He seems to have been born to shew us how much interest could be excited in a print without drawing, or any attempt at rendering local colour in the abstract, by mere dint of composition and chiaroscuro, and chiefly of the latter. Or, more strictly speaking, to shew us with how little drawing, and how entirely without the refinement of selection, in regard to forms, a powerful chiaroscuro may be kept together, and brought to operate on our imagination and judgment.

In the disposition of his lines, he seems to have been guided by no principle, but the spontaneous feeling of the moment; yet a certain tact of mind always attended him, and imparted style to his works.

It was probably from this spontaneousness of feeling, which in his prints stands instead of study, that we see so many variations in some of his plates; which appear to have been suddenly thought of, and promptly executed from time to time, just as his muse inspired. At least, this is a more artist-like, as well as natural supposition, than that his own avarice, or that of his wife, prompted these alterations (which have become so great objects of connoisseurship) with the sole view of obtaining the money which the additional sale produced. What man who maintains the contrary opinion, has proved that Rembrandt altered his plates for the worse? Yet this is absolutely necessary to the support of the mercenary side of the argument.

The genius of Rembrandt was universal, and whatever the subject of his engravings, whether history, landscape, or portrait, are marked by the same energetic truth; the same wild graces; the same forceful chiaro-

scuro. He painted and engraved what he saw, and did not attempt to generalise his objects by any process of abstraction, or accommodate or qualify them, by what he might suppose others had imagined. The learned precepts of his predecessors, such as that art should render men as they ought to be, not as they are, were disregarded or despised by Rembrandt, and so strong is the internal evidence of his works, or so persuasive his powers, that no spectator can entertain a doubt that his portraits, whether of persons or places, are transcripts of Nature, executed under a firm conviction that where she was picturesque, according to his view of the capabilities of art, she was as she ought to be.

The prints of this master are dated from the year 1628 to 1659: their number, when added to that of his pictures, is surprising, and attests at once his professional diligence, and the rapidity of his powers. Mariette possessed three hundred and seventy-five subjects: Yever, of Amsterdam, and Germain of Paris, in a descriptive catalogue which he formed, have enumerated more, and Mr. Daulby, of Liverpool, as the present writer has been informed, more still: so that their precise number is probably not known. It is scarcely necessary to add that no engravings, in their rare stages, or fine impressions, have been sought after with more avidity.

Of himself, Rembrandt has engraved no fewer than twenty-seven portraits, to distinguish which from each other, by means of words alone, might not be easy. One holds a pencil, and is more carefully finished than the rest: another is in a sort of Persian habit, with an oval border; in another, his wife also is introduced, and most of them are of quarto dimensions.

From the rest of his works, the following may be selected with advantage.

Subjects from the Old Testament.—"Adam and Eve in the terrestrial Paradise," rare; "Abraham sending away Hagar and Ishmael;" "Abraham and Isaac," arched at the top, all in quarto; "Joseph recounting his Dreams to his Father, in the Presence of his Brethren;" "Jacob mourning for the Loss of Joseph;" "Joseph solicited by the Wife of Potiphar;" in octavo; "Mordecai conducted in Triumph by Haman;" and "The Angel Raphael disappearing before Tobit and his Family," both in large quarto.

Subjects from the New Testament.—"The Annunciation of the Shepherds," with a very mysterious sentiment and powerful chiaroscuro, in folio; "The Adoration of the Shepherds," in large quarto; "The Circumcision of Christ," with an extraordinary good effect; "The Presentation in the Temple;" "The Flight into Egypt," both in 12mo.; another "Flight into Egypt," executed in his more scratchy style, in quarto; another "Flight into Egypt," in the style of Elsheimer, in folio, a very much esteemed print; "The Holy Family," where the Virgin is represented seated in an easy chair, and she and the Infant appear asleep; "Jesus preaching to the Multitude," all in quarto; "Cesar's Tribute Money," in 12mo.; "Christ turning the Money-Changers out of the Temple;" "Christ and the Woman of Samaria," a circular print; another of "Christ and the Woman of Samaria," in quarto, a very fine brilliant-toned engraving; "The Resurrection of Lazarus," a circular print, with a powerful effect, in large folio; "The Resurrection of Lazarus," a smaller print than the former; "Christ healing the Sick," a famous print, known by the name of "The hundred Florins;" an "Ecce Homo," a very grand composition, and a very capital engraving; "Christ taken from the Cross," attended by the Magdalen and the Holy Virgin. (4

companion to the former print;) "Jesus Christ presented to the People by the High Priest;" and its companion, "The Crucifixion of our Saviour," all of large folio size; (there are many impressions of this engraving, with various alterations;) "The Entombing of Christ," in quarto; "Christ with his two Disciples at Emmaus," in folio; engraved with broader strokes than is common in his prints; "The Good Samaritan arriving at the Inn with the wounded Man;" a very fine engraving, in folio; "Saints Peter and John healing the paralytic Man;" "St. Philip baptizing the Eunuch of Queen Candace;" and "The Death of the Virgin," a very fine forcible engraving, both of folio size.

Pious Subjects.—"St. Stephen stoned;" "St. Jerome," engraved when Rembrandt was in his meridian; "St. Jerome at Devotion," all in octavo; "St. Jerome writing," with spectacles on, in quarto; "St. Jerome," an unfinished plate, the composition of which is rich, and the finished part admirable; "St. Francis at Devotion;" great part of this plate is unfinished, and the prints are very rare.

Historical and Allegorical Subjects.—"The Hour of Death," an allegory on the vanities of the world; "Youth surprised by the Arrival of Death," represented by a young man and girl walking together, and a figure of death starting on them; "Medea, or the Marriage of Jason and Creusa," representing the interior of a temple and the statue of Juno, a very careful engraving, in folio; "The Star of the Kings," a ceremony used in Holland on certain nights, during which a lantern is fastened to the end of a long stick. The print is in quarto, and has a striking effect of night. A pair of "Lion Hunting." A chase of lions, in one of which a Turk is combating a lion, and another hunter is overthrown; "The Wandering Musicians," commonly called "The Blind;" it represents an old man and boy playing the bagpipes. "The little Spanish Gipsy," representing an old woman in a wood, conversing with a young person of distinction; "The Rat-Catcher," representing an old man with a stick, accompanied by a boy with rats in a trap, all in quarto; "The little Goldsmith," a man occupied in forming a small figure of Charity, in 12mo. with a very fine tone; "The Pancake Maker," an old woman frying pancakes, surrounded with children, one of whom is crying at a dog, in octavo, engraved in a very delicate style; "The Jew's Synagogue," representing two doctors of the law conversing; in the back-ground is a synagogue. "The Nail Cutter," a young woman seated, and an old woman on the ground cutting her toe-nails, a very rare print; "The Schoolmaster," in octavo; "The Quack Doctor," taking drugs from a basket, in 12mo., a very sparkling engraving; "The Peasant, with his Wife and Child," an unfinished print; "The Jew with the Large Hat," leaning on a stick, engraved in a free, but decisive manner; "The Onion Woman," representing a miserable old woman, with her feet on a chaffing-dish, anxious to sell a rope of onions, all in octavo; "The Astrologer," an old man in a profound sleep, sitting at a table with a candle, a globe, and books; in his right-hand he holds a pen, and his spectacles in the other; a quarto plate, with a very fine effect. "The Philosopher" in his apartment, contemplating a globe by candle light, has a very brilliant effect, in 12mo.; "A Man meditating," seated at a table, above which a lamp is fixed against the wall, which throws a glimmering light on all around, in quarto; "The Persian," a man in a hat and feathers, with a cloak on, in octavo, engraved in a very delicate style; "The Skater," a man skating with a bundle across his shoulder, in octavo, a very free, delicate engraving, rare.

Beggars.—A beggar in rags, leaning on a stick; the profile of a beggar, in the style of those of Callot; another in the same style; an old beggar woman soliciting charity. Lazarus Klap, a dumb beggar, seated on the ground, with his stick between his legs, in 8vo.; this is engraved in a broad style, and is very rare; a beggar seated on the ground, covered with rags, in his countenance is pictured extreme misery; beggars at the door of a house receiving charity: the group is composed of an old man, a young woman with an infant at her back, and another child, in 4to. This print is the most interesting, and the best executed of the whole set.

Furious Figures, academical, &c.—A young man and female in bed, surrounded with curtains, very rare; a shepherdess seated at the foot of a rock, making a garland of flowers, and a young shepherd lying near her, playing the flute, in 4to., a very rare engraving; "The Draughtsman," representing a man drawing from a cast of a female, surrounded with other models: this print in Holland is known by the name of "The Statue of Pygmalion;" and if it had been finished as well as it was begun, would have been very fine, in folio; "The Bath," representing figures bathing, in 4to.; "The Woman and the frying Pan," in folio; "Venus at the Bath." It has been remarked, that Rembrandt was not very happy in drawing naked figures; but here he has given his Venus the character of a goddess, in large 4to.

Landscapes.—A small landscape, engraved with great freedom, of trees and a house; "The Bridge of Six," with figures on it, in folio; a view of Amsterdam, a very good engraving; a landscape, with a village and spire, on the fore-ground of which is introduced a hunter with two hounds, very rare, in folio; a very rich and celebrated landscape, known by the name of "The three Trees," with the effect of rain, in folio; a very highly finished landscape, into which is introduced a girl with pails, and a dog; a landscape, with wood, water, and buildings: this engraving is very rare and singular, being washed with Indian ink, which gives it the appearance of a drawing. A pair of landscapes, one with a coach in it, with a view of a city and two windmills; the other is a mountain scene, with wood and water, in 4to., in the form of friezes, both washed with Indian ink; a landscape, arched at the top, of a village, with peasants before a cottage in the fore-ground: it has a very grand effect. Another village scene, arched at the top, with a square tower introduced, and two small figures seated on the ground; a landscape, with two cottages, and animals feeding on a meadow; on the fore-ground a figure is introduced drawing: this engraving is known by the name of "The Landscape Painter." A landscape, executed with the dry-point, called "The Cluster of Trees," among which is introduced a soldier's hut; a landscape, arched at the top, known by the name of "The Hay Stack," towards the right is a village and wood, and a flock of sheep guided by a shepherd, all in 4to.; a large landscape of an oblong form, representing a cottage with a stream running before it, over which is a wooden bridge, and a country girl crossing it: in the back-ground is a town, and a river, which winds to the fore-ground, where a man is introduced angling, with a child beside him; its companion is a landscape of the same size and form, of a canal and a large tree, by the side of which a cottage is represented with two children at the door: in the back-ground is a village and a windmill. "The Obelisk," a very well finished landscape, of a circular form, of an obelisk and a village, with water, in 4to.; "The Windmill, or Birth-place of Rembrandt," with his father's house; a view of the champaign of the re-

ceiver Utenbogaerd: towards the right hand of the print is a canal, with buildings, and two villages in the back-ground, both in large 4to.

Portraits of Men.—An old man, with a long grey beard, a very fine portrait, though left unfinished at the death of Rembrandt. G. F. Schmidt purchased the plate and finished it. A man with a chain and cross, in the act of writing; John Antonides vander Linden, professor and doctor of medicine at the university of Leyden, in his robes of ceremony, a very fine portrait; James Silvius, clergyman of Amsterdam, in robes trimmed with fur, seated at a table, all in 4to.: a young man seated, meditating: he has on a robe trimmed with fur, in 8vo.: the Jew Manassch Ben Israel, a commentator on many of the visions of the prophets: he is represented with a pointed beard, and a hat with a large round border. Doctor Faustus, (whom Gerfaint calls Fautricus,) a profile, down to the waist, is dressed in a robe, and wears a white hat: he is in the act of examining magical characters, a very rare portrait. Renier Anslou, an anabaptist, seated before a table, writing, with a hat on: his gown is bordered with fur. This is the most finished and the finest portrait we have from the point of Rembrandt. Clement de Jonge, a print-seller, seated in an easy chair, with a hat on, and his hair plaited: this plate is arched at the top. Abraham France, an amateur of engravings, seated at a table, examining a print; the elder Haring, with a leathern cap on; the younger Haring, son of the preceding, seated; John Lutma, a famous goldsmith of Groningen, one of the finest portraits of Rembrandt: he holds in his hand a little figure of metal, all in 4to. John Affelin, a painter of Antwerp, known in Holland by the name of "Crabbetje," or little John: it is a half-length portrait, with long hair, and a hat on: before him is a table, with a palette and books, in folio. Ephraim Bonus, a Jewish physician, with a hat on, in the act of descending a stair-case. This is one of the best of Rembrandt's portraits, all in 4to. Utenbogaerdus, a minister of Holland, in an oval, on an octagon plate: he is seated at a table, with an open book before him, and has on his head a leathern cap, in folio. John Cornelius Silvius, in an oval, around which is inscribed "Spes mea Christus. Johannes Cornely Sylvius. Amstelodamo bat. functus S. S. Minib. aos 45 et 6 menses. In Frisia, in Tyemarum et Phirugum aos 4." &c. Utenbogaerd, the banker and receiver of the states of Holland, commonly called "the gold-weigher;" the little Coppenol, the Dutch writing-master; the great Coppenol, both very rare prints, all in folio; the lawyer Tolling, a very fine and rare portrait: he is represented seated at a table with books, in large 4to. The burgomaster, John Six: this celebrated portrait is very rare, and sold at Mr. Grosse's sale, some years since, for five-and-thirty guineas. It is said, there is an impression of this plate without the names of the burgomaster or Rembrandt, in folio.

Ideal Heads of Men.—An eastern figure, with a little cap on, and short hair, covered with a fur gown; a profile, with a turban on; an eastern figure, with a long beard, in a turban, very rare. These are all marked "Rembrandt Venetiis, 1635:" and it is said that he so marked them, to make the amateurs believe that he had been at Venice. Bust of a man with a short curly beard, in a black gown: bust of an old man, with a long beard, whose head is reclining as if he slept; an old man, with a long grey beard, and very little hair on his head, habited in a long robe, in 8vo.: a young man, half-length, in profile; bust of an old man, with a square cut beard, with a velvet cap on; a man, with mustachios, half-length, with a hat on, and a gown trimmed with fur; a half-length portrait of a man seated, at an easel

painting, inscribed "W. Droft," most probably the portrait of Rembrandt's pupil, Droft, very rare; the bust of a young man, with long hair, engraved on a white ground, supposed to be Titus, the son of Rembrandt, in 4to., rare; a half-length profile of a man, with the physiognomy of a negroe, with a turban on, in 4to.; a philosopher, with a fable, a long square bearded head, with a fur cap on.

Female Portraits.—A three-quarter view of a young Jewess, seated, in folio; the little Jewess, newly married, three-quarter, with long hair hanging on her shoulders; two portraits of old women, in black veils, very highly finished, in 4to.: "The Reader," a young woman seated at a table, reading, a very good engraving; and its companion, an old woman, reading, in 4to.; a half-length profile of a lady with her hair dressed with beads, in 8vo.; an old woman, with her hair dressed in the eastern style, seated. It is engraved in so delicate a style, that a clear impression is seldom met with. A bust of the mother of Rembrandt, with her hair dressed, in a black veil; an old woman asleep, resting her head on her hand, dressed in a turban; bust of an old woman, three-quarters, in a black veil, engraved in a broad style, in 12mo., very rare; the profile of a young girl in a hat: she holds a basket across one arm, and a purse in the other hand. A nearly profile head, in a veil turned up, and a feather, in 8vo.; an old woman with spectacles, a half-length profile, reading, a very spirited engraving, and very rare.

Studies and Sketches, &c.—Several studies engraved on the same plate, among others we discover a head of Rembrandt himself; a clump of bushes, surrounded with a wall, a horse, and several heads, very rare; study of six heads, among which is the wife of Rembrandt; ditto of five heads of men; ditto of three female heads, a very spirited engraving; a plate of studies of various heads and figures; set of ditto, among which we distinguish the head of Rembrandt, with other figures: this is very freely engraven, and is one of the rarest of the studies of Rembrandt. A very tasteful unfinished engraving of various objects, and a tree, very indefinite, in 12mo.; profiles of three old men's heads, in 8vo. All the preceding are of quarto size.

Doubtful Subjects.—"King David kneeling, at Devotion, crowned;" "A Repose during the Flight into Egypt," with the effect of night; the Holy Family are seated on a bank at the foot of a tree, to which is fastened a lantern, which casts a glimmering light over the whole scene, in octavo. "Jesus Christ taken to Calvary," a very rich composition; "A Skirmish, or Village Fair," a very fine engraving, in a slight style; on the fore-ground is a ratcatcher holding a basket on the end of a long stick, with rats in it. A bust of a man, with a bandolier on his shoulder, with a double clasp of precious stones; "The Pen maker," an old man seated at a desk, with spectacles on, mending his pen: "The young Scholar," seated on a stone at the foot of a tree writing, very rare; bust of an old man laughing, with a little hat on: this is executed entirely with the dry point, and finished in a very good style, all in 4to. Klaas van Ryn seated, with a long beard, inscribed on the margin with his name, in 12mo.; and three dromedaries, followed by two camels, with eastern trappings, engraved in a free spirited style.

John Lievens, Livens, or Lyvyas, was born at Leyden in the year 1607. He became the pupil of George van Schooten, and afterwards of Peter Laitman. He excelled principally in painting portraits, but likewise executed some historical pictures with great success. In the year 1630, he came into England, where he resided three years, and painted the portraits of Charles I., the queen, the prince

prince of Wales, and several of the nobility. Lievens made a considerable number of engravings and etchings, somewhat in the style of Rembrandt, scarcely less picturesque, but coarser, and in general less finished; but he always managed his chisello to as to produce a very good effect.

Adam Bartsch informs us, that Lievens drew more correctly than Rembrandt, (which he might easily do,) but did not engrave in so picturesque a style; those plates which he meant to finish highly he executed with a very delicate touch, and sometimes he used to hatch so close, that the aquafortis bit his lines nearly into a blot; for instance, those which are on the fore-ground of "The Resurrection of Lazarus." It does not appear that this artist made much use of the dry point, but frequently used the graver to strengthen the strokes. His print of St. Jerome is strongly retouched with that tool, and two of his finest portraits, those of Daniel Heinsius, and Jacques Gouter, are wholly executed with the graver; they are in a very picturesque style, and bear some resemblance to etching. He marked his prints either with his initials, or his name, which he sometimes spelled *Lyvyns*. The following are a selection of those engravings by this master, which are most worthy the notice of the collector.

Portraits and Heads.—Doctor Ephraim Bonnus, a half figure seated; Joost, or Justus Vondel, a Dutch poet; Daniel Heinsius, professor of history and politics at Leyden; Jacobus Gouter, the English musician, a half figure, with a lute, all in folio; an old man with his head shaved and a long beard, taken for the portrait of Conrad Leonard, an early preacher of the gospel in Greece; the profile of an old man, with a long beard; bust of a man with a turban on, very fine, after Rembrandt; ditto of a man, with long hair; half-length figure of a woman, with long hair; bust of a young man, with an open robe, in the style of Rembrandt, all in quarto; ditto of a man, with a bonnet on, in the taste of Rembrandt, in 12mo; profile of an old man, with a short beard; profile of an old man, with a long and pointed beard; a half-length portrait of an old man seated, all in quarto; bust of an old man, with a short beard and bald head, in octavo; ditto of a Persian, with a cap and robe; ditto of a man, with curly hair; profile of a man, with a hat on; ditto of an old man, with a little cap on; ditto of an old woman, with a veil on, in the style of Rembrandt; ditto of a young woman, with a pearl ornament on her head; profile of a woman, with her hair falling on her shoulders; head of a young woman, with the character of a negro, all in 12mo.; bust of a Capuchin, with a long pointed beard, and a hat and mantle, in folio.

Historical, &c.—"The Virgin and Infant Christ," with St. Joseph, and various other figures, in octavo; "The Virgin and Infant Christ," to whom she presents a pear; "The Resurrection of Lazarus," a grand composition, in folio; "St. John the Evangelist seated at the Foot of a Tree, with a Book," in quarto; "St. Jerom seated in his Cell, holding a Crucifix and a Skull," in folio; "St. Francis in his Cell, meditating," in large quarto; "The Anchorite," or St. Francis, differing very little from the preceding engraving, in quarto; "St. Anthony seated, with a long beard, and a Capuchin Cowl," in folio, very rare; "Mercury and Argus," in large quarto; "Jacob performing a Sacrifice," an eastern figure in a cloak; bust of a man in eastern attire, with a chain round his neck, in folio, both on shadowed grounds; bust of a man with long curly hair falling on his shoulders, in large 4to.; an engraving of three trees, without any back-ground, in folio: both these engravings are executed on wood, but do not possess

any great share of merit. "Death striking two Peasants," who are represented gaming and quarrelling, of folio size.

Erasmus Quellinus was born at Antwerp in the year 1627, and died in the same city, in the cloister to which he had retired in 1678. He shewed an inclination early in life for the arts, and studied under Rubens: he became an historical painter of considerable merit, and likewise executed some landscapes in a very masterly style. Quellinus etched some plates from his own compositions and those of Rubens, of which it may be sufficient to specify the following: Erasmus Quellinus, which was published with an account of his life in the French language, in quarto; a folio landscape, with a dance of satyrs and children, rare; "Samson killing the Lion," in quarto, from Rubens; and "The Holy Virgin and Child," in folio, after Rubens.

Hubert Quellinus was born at Antwerp in 1608; he was of the same family as the preceding artist, and brother to Artus Quellinus the sculptor. Hubert engraved somewhat in the style of Soutman, bringing his plates very forward in the etching, and finishing them with the graver in a very neat pleasing style.

He usually marked those plates which he engraved from the sculpture of his brother with the initials of Artus, as well as his own. The following are selected from the works of this artist as being most worthy of attention.

A set of the statues which his brother Artus executed in marble, for the Stadthouse of Amsterdam, after the drawings of John Bannokel, in a folio volume. The portrait of Artus Quellinus, also in folio; a handsome piece of adulation offered to Philip IV. of Spain, who is represented on his throne, surrounded by allegorical virtues, &c.; "The Judgment of Solomon;" "The Legislator Zaleucus redeeming the Penalty of his Son;" "The Province of Holland," personified and surrounded with emblematical figures; and a set of twelve plates of naval and military triumphs, and other decorative ornaments of the Stadthouse at Amsterdam, all of folio dimensions.

Theodore van Thulden, of Dutch ancestry, was born at Bois-le-Duc in the year 1607; but became the disciple of Rubens, whom he accompanied to Paris, and assisted in his grand undertaking of the Luxembourg gallery.

He painted a few other pictures which are deservedly held in esteem, and etched a considerable number of plates in a firm, clear, and determined, but slight style.

In his praise as an engraver, much cannot be said. His chisello is but feeble; to expression of the textures of substances, he gave little heed, and his drawing is so mannered, that the spectator of observation easily traces in his prints the same hand, though working after very different masters.

He engraved the principal events in the life of St. John of Matha, in a set of twenty-four small folio plates, from pictures with which he adorned the church of the Mathurins at Paris; "The History of Ulysses," on fifty-eight small plates, from the pictures of Primaticcio at Fontainebleau; "The triumphal Entry of the Infanta Ferdinand into the City of Antwerp," on eight folio plates, after Rubens; a set of six smaller plates, from the parable of "The Prodigal Son," after the same master, beside other works of inferior importance.

Janus, or John Lutma, was a goldsmith of Amsterdam, who distinguished himself by the invention of a new mode of art, which had its day of novelty, and was for a time popular among superficial connoisseurs; it was termed *Opus Mallei*, being performed with a hammer, and small pointed punches, which made an impression upon the copper, and by being repeated as occasion required, the shadows were

formed either darker or fainter, at pleasure. The burr, which was necessarily raised upon the surface of the copper by such an operation, was not entirely removed by the scraper; and in the early impressions, is the means of producing a soft and agreeable effect. He engraved four plates in this style, which are as follows: Janus Lutma; John Lutma, his father; the poet Vondel; and P. C. Hooff, the historian, all of them in folio, and apparently from his own drawings.

John Lutma, the son of the preceding artist, was born at Amsterdam, A.D. 1609. He was likewise a goldsmith, and executed some few plates; among others the following: the portrait of John Lutma the father, habited in a robe bordered with ermin, holding spectacles and a pencil; portrait of himself, seated at a table, drawing; he has on a broad brimmed hat, which overthrows his face: this print is very rare, both in folio; and a view of a large fountain with statues, and the Antonine column, with some other ruins at Rome. It is first etched in a coarse, bold style, and the shadows are worked upon with a fine mezzotinto tool. The effect produced by this mixture is confused and heavy, but not altogether disagreeable to the eye.

James Lutma was of the same family, and also resided at Amsterdam; by this artist we have a set of twelve middling-sized upright plates of ornamental shields and foliage, etched in a neat style and finished with the graver; likewise the portraits of the three Lutmas, marked "John Lutma of Oude inv. James Lutma fecit, aqua forti."

Adrian Brouwer, celebrated for his attainments in art, and his wild and immoral habits, executed a few plates about this period, of such subjects as he usually painted. (For his biography, see the article BROUWER.) His principal etchings, which are executed with much spirit, freedom, and taste, and are generally subscribed with his initials, are, a party of four peasants inscribed "T'fa orienden," &c.; a rustic dance, where a female is playing the flute, inscribed "Luttig spel," &c. both in folio. Three peasants smoking, inscribed "Wer aent smoken," in small folio; a drunken party of four rustics; two peasants in conversation; a droll smoking party, consisting of a man, a woman, and an ape, inscribed "Wats dit voor en gedoocht," &c.; a rustic baker making cakes, a circular print; a peasant lighting his pipe, and a set of six of male and female peasantry; all of quarto dimensions.

Solomon Koninck was born at Amsterdam in the year 1600, and was the son of Peter Koninck, a celebrated connoisseur and jeweller of that city, who at the age of twelve placed his son under David Colyn, to learn the rudiments of drawing; he afterwards studied successively under Francis Vermeulen and Nicholas Moyart, and became a painter and engraver of some eminence. He etched several subjects in the style of Rembrandt, after his own designs; of which the following constitute the more estimable part. A head in profile, of an old man with a long beard; ditto of an old man, in eastern attire, with mustachios; a companion to the preceding, but engraved in a much more delicate manner; a three-quarter bust of an old man with a furred hat; an old man seated in an easy chair, at devotion, a very fine engraving; bust of a venerable looking old man, with a beard; and a landscape with cottages, all of quarto size.

Nicholas Berghem also performed some etchings about this time, which consist chiefly of what may be termed Italian and Dutch pastorals, and beam with taste and intelligence. It is believed that all his prints are solely the result of aquafortis and the etching-point, and that his plates were never touched with the graver. They are all from his own com-

positions, and for the most part appear like transcripts from the sketch-book, wherein he drew as in all from nature.

The etchings of Berghem, like his pictures, delight by the found and intimate knowledge of drawing and chiaro-scuro, which they display or imply; and the exquisite feeling which every where attends his touch, and which seems almost, speaking without figure or hyperbole, like actual contact between mind and its object.

These are the qualities which impart such truth of texture and character to his various domestic animals, whether rough or smooth-coated; such picturefqueness to his grassy grounds and earthy and rocky banks, and such importance to his trifles.

For the biography of this artist, see BERGHEM, NICHOLAS. In conformity with our general plan, we shall here add some account of his principal engravings, referring those who may wish for more particular information, to the catalogue of Henry de Winter, which was published in Holland in the year 1767.

Six sets in small quarto, of six prints each. These are performed with all the fire and fervour of Berghem, and each set consists of five plates of animals, and an appropriate title page, by which the set is known, *e. gr.* there is "The Milk-man" set, "The Shepherdess" set, "The Goatherd" set, &c. &c. The title-pages are all inscribed with the following words, which shew that they are as we have before furnished, the probable contents of the sketch-book in which our artist was accustomed to draw from nature; *viz.* "Animalia ad vivum delineata et aquaforti ceri impressa studio et arte Nicolai Berchemi." A set of five folio landscapes, which are distinguished from each other by the figures and cattle which are introduced, and which are as follow: 1. A Peasant seated playing on the Flute. 2. A Group of Cattle, with a Woman and Child crossing a Rivulet. 3. A Shepherd, with Sheep and various Cattle. 4. A rustic Girl on an Ass, stopping for Refreshment at an Ale-house Door. 5. A Shepherd on horseback, reading to a Woman on an Ass, as they slowly travel. A set of four, in quarto, *viz.* 1. A Landscape, with Oxen, and a Woman milking a Cow. 2. Another with three Horses and two Cows, with a Shepherd in the Back-ground. 3. Another with two Cows, and some Goats. 4. Another with an Ass, Goats, and a Shepherd; and a set of six small plates, which are very rare, and uncommonly fine, of heads of rams and goats.

Detached Subjects of Berghem.—A cow, in folio, the earliest impressions of which have the name of Berghem in italics; a famous print of a cow watering, in folio; a landscape with two cows lying down, and another standing on the foreground; a landscape with cows, and a man on an ass; a landscape, with a shepherd on an ass, driving goats, in the back-ground a woman is introduced with a basket on her head, all in folio; a woman washing her feet in a brook, and a man behind her leaning on a stick, with other rustic figures and animals, in large folio; a landscape, with a man standing playing the flute, and a woman seated on the ground near him, a rare print, in folio; and its companion, a shepherd, and his wife seated suckling her child, a very rare print; and a boy seated on an ass, speaking to another boy, who holds a pair of bagpipes.

The beauty and value of the works of this master depend much upon the impressions, and early, good, and well preserved impressions are now become very scarce.

The author of the Abecedario, misled by the cypher of Berghem, which the reader will find in our *Plate III.* of the monograms of the engravers of the Netherlands, has

fallen into the error of calling him Cornelius Berchem. Florent le Comte has also supposed that there were two artists of this surname, one of whom he calls Cornelius; whereas the letter C in Berghem's cypher stands for Claus, the common abbreviation of Nicholas among the nations of the continent.

Herman Zacht-Leeven, or Sachtleeven, was born at Rotterdam, A.D. 1609, and died at Utrecht in 1685. He was the disciple of John van Goyen, and became a landscape-painter of great celebrity. He etched some few plates in a free and intelligent style from his own compositions, of which the following are the best; a landscape and cattle; a mountainous landscape, with figures and water; both in quarto. A set of six landscapes, the first of which is executed by Ag. Winter, and the remainder by Sachtleeven, in quarto; and a landscape, with two elephants, in folio.

Cornelius Sachtleeven was the younger brother of Herman, mentioned in the preceding article, and was born at Rotterdam in the year 1612. He painted in the style of Brouwer and Teniers, commonly selecting such subjects as village parties, soldiers regaling, &c.

This artist likewise etched several plates from his own compositions in a slight spirited style; amongst which the following are those which are held in most esteem. "The Five Senses," intitled "De vyf Sinen, wt ghebelt door Cor. Sachtleeven." A set of twelve small plates of animals; and a landscape, with animals and a goatherd, of quarto size; executed in a broad and picturesque style.

John George van Vliet was born at Delft in the year 1610; and was one of the most successful of the disciples and imitators of Rembrandt. He executed a considerable number of etchings, some of which possess great merit, particularly those from the drawings and pictures of his great master. They are exceedingly powerful in effect; the shadows being dark, and the lights broad and clear; but his figures in general are very incorrect, the extremities badly marked, and the draperies heavy.

Van Vliet usually etched his plates with a very delicate point, afterwards strengthening them with aqua-fortis and the graver. His plates are well worthy the observation of such artists as wish to make a proper distribution of light and shade an essential part of their study. At the sale of Mariette, a complete set of his works was sold for one thousand and seventy-five livres. He commonly marked them with his name, or a monogram, which will be found amongst those of the engravers of the Netherlands. The following are the most worthy the attention of the connoisseur.

Portraits and ideal Heads.—Bust of a man, from Rembrandt; an Oriental head, dressed in a turban, and diamond ornament; head of a warrior; profile of an old man, with his hands clasped, looking upwards; ditto of an old man with a grey beard and a leathern cap; ditto of a man with mustachios, and a fur bonnet and mantle; all in folio. Bust of an old man with mustachios, habited in a mantle; Profile of an officer, with a hat and feathers, both in quarto; and a beautifully finished plate of an old woman reading, her head is covered with drapery which falls on her shoulders, in folio; all from the pictures of Rembrandt.

Historical, &c.—"Lot and his Daughters," a folio print, in which the chiaroscuro is remarkably well managed. "The Baptism of the Eunuch of Queen Candace," a grand composition, of which good impressions are very rare, in large folio; "St. Jerom kneeling, at Devotion," a very fine print; all from Rembrandt, and in folio. "St. Jerom reading," from a picture by Van Vliet himself; "Isaac discovering his Mistake in having given his Blessing to Jacob;"

"Sufanna surprised by the Elders," both from Livens, in large folio; "The Resurrection of Lazarus," from his own composition, in large folio. John Louys copied this print, and his copy is superior to the original. "The Ballad-finger," who is represented in a village street, surrounded with rustics, in folio; "The Rat Seller," in quarto; four figures in Spanish attire, playing at trictrac; a woman and child listening to a man who is seated on a basket turned upside down; "The Philosopher reading," with a remarkably fine effect; "The Mathematician writing by Candle-light," all in quarto; "An Orgie of Peasants," a very good composition, of six figures, in folio; all from his own designs.

Ferdinand Bol was born at Dordrecht in the year 1610, but lived and died at Amsterdam, where his parents came to reside when he was but three years old. He studied in the school of Rembrandt, and attained great celebrity as a painter of history and portraits. He executed a considerable number of plates in a bold free style; the lights and shadows are broad and powerful, which renders the chiaroscuro of Bol particularly striking; but his prints want that lightness of touch and admirable taste which those of Rembrandt possess in such high perfection. The following are a selection of the best engravings of Bol, and are nearly, if not quite, as much sought after as those of Rembrandt.

Portraits and Heads.—Half-length portrait of a young man, with a hat on; portrait of an officer, both in 4to. Half-length portrait of a man, with a hat and feathers; a young woman with a cap and feathers, in an oval; both in 8vo. The woman and the pear, being a portrait of a young female in a veil, presenting a pear, a very fine print, in 4to. An old man seated, habited in a fur robe, in large 4to., a rare print. A very spirited half-length engraving of an old man, with a cap on. And a bust of an old man habited in a fur robe, in an oval of quarto size, very rare.

Historical, &c.—"A Philosopher in his Study," with globes, books, &c. and a very fine effect; "A Philosopher reading." An old man seated before a table, on which are placed globes and books. This print is commonly known by the name of "The Astrologer," all in 4to. A family in a room, consisting of a man, woman, and child sucking, known by the name of "The Chamber of the Accoucheur" in folio; "Abraham's Sacrifice," arched at the top, in large folio; "Hagar and Ishmael in the Desert," in folio; "The Sacrifice of Gideon," represented at the moment when the angel lights the sacrifice, in the back-ground is the altar of Baal, in 4to.; and "St. Jerom contemplating a Crucifix," in a circle of folio size.

The events of the life of Dirick or Theodore Stoop are very obscure. He was born somewhere in Holland in the year 1610, or thereabouts, but how he acquired his great ability in painting and etching is not known. His etchings are from his own compositions, are performed in a very neat and picturesque style, and are much and deservedly celebrated, and highly valued.

His principal work is a set of twelve plates in small folio, of which the subjects are horses, dogs, and peasantry, engaged in various rural occupations, and marked D. Stoop, fec.

Rodrigo Stoop was the younger brother of Theodore, and was born in Holland, A.D. 1612. According to the author of "An Essay towards an English School of Painters," the baptismal name of this artist was Peter, but he always placed the initial R before his family name, and is called Rodrigo by the continental writers. He came into England

England with queen Catherine, and resided here till the time of his death, which happened in 1686.

This artist engraved several plates, after his own compositions and those of Barlow. They are executed with great spirit, in a style which does him much credit, but we can only specify the following: A set of eight, views of Lisbon, dedicated to queen Catherine; another set of eight, representing the procession of queen Catherine from Portsmouth to Hampton Court, dated 1662; and several of the plates for Ogilby's edition of *Æsop's Fables*, published in 1678, after Barlow. These are slight hasty performances.

Anthony van der Does was born at the Hague in the year 1610. He chiefly engraved portraits; if he was not the disciple of Paul Pontius, he imitated his style; and although he never equalled that great master, yet his best engravings possess a considerable share of merit. He engraved most of the plates for a collection of portraits of the illustrious men of the seventeenth century, published at Amsterdam, many of which are dated 1649. Among his best portraits are those of Gerard Cock, a plenipotentiary to the court of Osnabruck; George Wagner, plenipotentiary to the court of Osnabruck, both in folio, after Anselm Van Hull; Ferdinand, cardinal infant of Spain, and governor of the Low Countries, after Diepenbeck, in large folio; the marquis of Castile-Rodrigo, after Rubens, in large 4to.; Francis de Mello, small folio; Francis de Mello, on horseback, in folio, from J. Boffart.

And of his *Historical Prints*, the most esteemed are "A Magdalen," half figure, in 4to., from Vandyke; "A Miracle performed by St. Francis," after Diepenbeck; "A Madonna and Child," after Erasmus Quellinus; and "A Holy Family," from the same painter, both in folio. The Holy Family is accompanied by two angels, one of whom is strangely employed in warming linen for the child, whilst the other makes its bed. Of the remainder of this family of artists, we have already treated in vol. xii. See DOES, JACOB and SIMON. VANDER.

An account of the lives and works of CORNELIUS BEGA, and LEONARD COOGHEN, (which should else have been introduced in this place,) will also be found under those heads respectively. The plates of the former, impressions from which are much sought after by connoisseurs, have recently been purchased and republished by a foreign print merchant, with descriptions in the French and Dutch languages. They amount to thirty-four plates of humorous and vulgar rusticity.

Edward Eckman, or Eeman, was born at Mechlin in the year 1610. He was a most excellent engraver on wood, and copied many of Callot's prints, even imitating the free style of that master with great success. The distant parts of his engravings are very neatly executed; and the perfect forms of the smallest figures exceedingly well preserved. Among other engravings by him, is the representation of the fire-work upon the river Arno, from Callot, which Papillon, who has certainly judged well in this instance, calls an admirable print, adding, that it is impossible to find a more delicate engraving on wood.

Eckman engraved also from Louis Buisinck, Abraham Bosse, and others. The number of his prints is said to be one hundred and five.

John Thomas was a native of Aspres, and born in the year 1610. He was a successful pupil of Rubens, and afterwards, in company with his fellow student Diepenbeck, went to Italy, where he met with great encouragement from the bishop of Merz. In 1662 he was entitled first painter

to the emperor Leopold, and had a considerable pension allowed him by that prince.

Thomas etched several plates, in a bold, free, and spirited style, which are much sought after by collectors, among which the following may be reckoned the best. "Mercury conducting a Ghost before Hecate;" "A Lady at her Toilette;" "A Shepherd caressing a Shepherdess;" "A Satyr offering Violence to a Shepherdess;" all of 4to. size, from his own designs; and a pastoral subject, composed of six figures, three men and three women, one of the former is playing upon the bagpipes, in folio; likewise from his own invention. The two latter are composed so much in the style of Rubens, that some authors have attributed their invention to him, but without foundation.

John Troyen, or Van Troyen, was a native of the Low Countries, and born A.D. 1610. He produced several etchings from the pictures of Italian masters, collected by D. Teniers, for the gallery at Brussels. They are executed in a slight, coarse, incorrect style, but his prevailing tones of light and shade are tolerably good.

The following are the best part of them. "Salome presenting the Head of St. John to the Daughter of Herod," after L. da Vinci; "The penitent Magdalen;" after Correggio; "The Adoration of the Kings," after P. Veronese; "Jesus Christ healing the Sick," from the same painter; four subjects of "The Seasons," after Bassan, all in folio; and a grand composition, in large folio, after L. Pordonna, of "The Entombing of Christ."

Peter Leybetius, or Van Leybetten, was the contemporary of Van Troyen, and, like him, was employed in engraving part of the gallery of Teniers. His plates are executed in a coarse and incorrect style; among them are a portrait of David Teniers, senior, in 4to., from Van Mol; "Diana reposing," attended by an old woman, after Titian; "The Marriage of St. Catherine," after P. Veronese; "The Visitation of Elizabeth," after Palma the elder; "The Virgin at Prayers, and St. John caressed by the Infant Saviour," after the younger Palma; "Cupid presenting Venus with Fruit;" and "Diana and Endymion," after Paris Bordonna, all of folio size. The two last are remarkably ill drawn, and the rest reach not above mediocrity.

John Meyssens, or Mytens, was born at Brussels in the year 1612. He learned the principles of painting from Anthony Van Obstal, and afterwards became the disciple of Nicholas vander Horst. He painted both historical subjects and portraits, but was most successful in the latter. He resided at Amsterdam, where he published several collections of engraved portraits, not only from his own paintings but those of Vandyke, and a variety of other masters. Meyssens engraved and etched, and we have by him a collection of portraits which he published in 1649. Prosper Merchand, in his historical dictionary, mentions a book of portraits by this artist, (likewise published by himself,) which is become very rare, on the frontispiece of which is the name of "Speckkraemer." They are in general greatly inferior to what might have been expected from his hand, and do not do him much credit as an artist. Of these mediocre performances, it may be sufficient to specify the following, which are rather valued on account of the pictures from whence they are engraven, than on account of the merits of the engraver.

Portrait of himself; Henry de Kyser, architect and sculptor; Guido Rheni; Daniel Seghers, Jesuit, and flower painter, from Livens; Cornelius de Bie, from Erasmus Quellinus; William de Nieulandt, painter, from the same master; Mary Ruten, the wife of Vandyke, "The Virgin and Child," half figures, from Titian, all in 4to. A A

"Meleager presenting the Boar's Head to Atalanta," from Rubens, in folio.

Cornelius Meyfless was the son of John, and born at Antwerp, A. D. 1646. He learned the elements of art under his paternal roof, but removed from thence to Vienna, where he remained some years. He seems chiefly to have been employed by his father in engraving portraits, which he executed entirely with the graver in a stiff, tasteless style. His best prints have no great merit to recommend them, and the rest are mere slovenly performances, evidently executed in a hurry. The most considerable work we have by this artist is a set of portraits of the emperors of the house of Austria, in folio, entitled "*Effigies Imperatorum domus Austriacae, delineatae per Joannem Meyfless, et aeri incisae per Filium suum, Cornelium Meyfless.*" This proves, beyond contradiction, that he was the son of John, and not the nephew, as Baffan affirms. His work of next importance is in folio, and entitled, "*Les Effigies des Souverains Princes et Ducs de Brabant.*" In these he was assisted by Peter de Jode, Waumans, Van Schupen, and other artists. Octavius, duke of Aresburgh; Antonius Barbermus, Cardinalis Camerius, both in 4to; Rinaldo Principe Estense, cardinale protettore della Corona di Francia, in folio; Giovanni de Witt, Signor di Linschoten, &c. Pensionario di Olandia; Casparus Keitwerdus, Pastor Ecclesiæ Vefala, from B. D. Meys; and David Conte di Weissenwolff, Signor di son et Eusegg; S. B. Van Dryweghen delt. all of folio dimensions, may also be admitted into collections of the school of the Netherlands.

Marc de Bye was born at the Hague in 1612, of a noble family: he passed some of the years of his youth in the army of the Dutch republic, and became a member of the Academy of Arts in 1664.

He learned the principles of painting of James vander Does, painted animals with all the truth and taste of that master, and etched several sets of plates, of which the subjects were wild and domestic animals, in a very neat spirited style, after Paul Potter and Marc Gerard.

The following may be selected with advantage from the rest of his works: Two sets of eight quarto plates, each of horned cattle, after P. Potter; another set in quarto, from the same painter; a set of eight, of goats and sheep; a set of sixteen, of goats; a set of sixteen, of lions, bears, wolves, leopards, &c. after the same painter; and a set of sixteen, of "*The Natural History of the Bear*," in different countries, after Marc Gerard, very rare prints, in quarto.

Francis vanden Wyngaerde was born at Antwerp in the year 1612, and established himself in that city as an engraver and print-merchant. His works prove him to have been a man of ability; his etchings are executed in a slight and free, but masterly style, and are much sought after by connoisseurs. Among those which are the most worthy of attention, are the following:

"Sampson killing the Lion," from Rubens, in 4to.; "Jesus Christ appearing to Mary Magdalen in the Garden," in folio; "The Marriage of Thetis and Peleus," in large folio; a bacchanalian subject, where Bacchus is represented drinking from a cup, into which a bacchante is squeezing grapes, a fine and rare print, in large folio; "Soldiers regaling in an Alehouse," all after Rubens. "The Entombing of Christ," after A. Vandyke, both in folio; "Achilles discovered at the Court of Lycomedes," after the same painter, in folio; "The Return from Egypt," in which the Holy Virgin appears in a straw hat, from J. Thomas, a fine engraving, in large folio; "Peasants smoking and drinking before an Alehouse Door," from Teniers; "The

Temptation of St. Anthony," from his own composition, a very rare print; two women, one of whom is contemplating a sleeping infant by candlelight, after Callot; and its companion, a female leaning on a skull before a looking-glass, after the same master, all of folio dimensions.

Reynier, or Remigius Nooms, better known by his cognomen Zeeman, was born at Amsterdam in the year 1612. He was originally a tailor, but having an innate love and natural talent for fine art, he accustomed himself to imitate on paper what he saw, and by pursuing this mode of study in the school of nature alone, gradually became a marine painter and engraver of considerable rank and ability.

It should be known that the Dutch word *zeeman* is synonymous with seaman, or mariner. As the imitative powers of the sailor discolored themselves, his countrymen could not but behold his productions with some degree of pleasing wonder, nor was due encouragement withheld. At one period of his life he accepted an invitation to Berlin, and if we may judge from twelve of his engravings of shipping, &c. which were published here by Tooker, he resided for a time in London, but finally returned to Amsterdam, where he executed a considerable number of plates from his own designs, in a bold and intelligent style. They consist of shipping and marine views, ornamented with good figures, and closed by back-grounds, which are often beautifully executed and appropriately introduced.

Of these, the most important are, a set of eight naval subjects, entitled "*Quelques Navires*," &c. dated 1632, in 4to.; another set of six, of views of public edifices on the sea-shore, and the yacht which travels between Haarlem and Amsterdam, in folio; a set of twelve, of shipping, naval arsenals, &c. in folio, published in London by A. Tooker; four Dutch sea-ports, in folio, entitled "*Raan Poortie*;" "St. Antoni's Poort;" "Regiers Poort;" "Saagameulins Poortie;" dated 1636. Another set of four, of Dutch sea-ports, also in folio; "The Four Elements," in 8vo.; a pair of "The Faubourg of St. Marcan;" and "The Porch of St. Bernard," at Paris; a sea-fight with ships on fire, and another marine subject, with two ships engaging, all of folio dimensions, and from compositions by the engraver himself.

Henry Snayers, or Sneyos, was born at Antwerp in the year 1612, and always resided in his native city. Of whom he learned engraving is uncertain, but he evidently imitated the styles of P. Pontius and the Boffwerts. His prints, as is believed, are the sole production of the graving tool; he drew correctly, and much of the character, expression, and spirit of the original pictures after which he worked, are infused into his translations.

When engraving after Rubens, his prints, of which the following are the best, bear strong resemblance to those of Scheltius a Boffwert.

The portraits of Adam Van Oort, after Jordaens, and prince Robert, count palatine of the Rhine, after Vandyke; "The Holy Virgin and Infant Saviour appearing to St. Alanus of Rupe," a rare print, in large folio, and presumptively after a composition by Snayers himself; "The Holy Virgin seated and surrounded by Saints," in large folio; "The Fathers of the Church debating the Question of Transubstantiation," of very large folio dimensions; "St. Francis d'Assise receiving the Sacrament of Extreme Unction," all after Rubens; and "Sampson delivered to the Philistines," after Vandyke, also in large folio.

Alexander Voet, or Voert, the younger, was a native of Antwerp, and born in the year 1613. He was probably the disciple of Paul Pontius, whose style he frequently imitated, but not with any very great success. There is a want of

of effect, and an incorrectness of outline, even in his best works, though engraved very neatly. He executed a considerable number of plates, after Flemish masters, but more particularly after Rubens; the best of which are as follows: "Judith and Holofernes," in large folio (the earliest impressions of which are before the name of C. Galle was inserted); "The Return from Egypt," in folio; "The Virgin and Child," to whom angels present a basket of fruit, in folio; "The Martyrdom of St. Andrew," a fine print, in large folio; "St. Augustin," rare, in large folio; "St. Agnes with a Lamb," in folio; "Seneca in the Bath, bidding Farewell to his Friends," "Roman Charity," both in folio; "A Satyr with Fruit," accompanied by a bacchante, in large folio, all after Rubens; "Folly," after Jac. Jordans; "The Card-Players," after Corn. de Vos, both in large folio; and "Christ bearing the Cross," a capital print after Vandyke, engraved on three plates.

Peter Baillu, or Balliu, was born at Antwerp in the year 1614. He learned the rudiments of painting in his native country, after which he went to Italy for improvement, where, in conjunction with other artists, he was employed in engraving the Justinian Gallery. On his return to Antwerp, in the year 1635, he was much patronized, and his engravings are, by many collectors, held in no small esteem. Huber classes him among the first engravers of his age. His works exhibit some talent in the art of expressing the textures of various surfaces, and his chiaroscuro possesses considerable force; yet his heads are seldom expressive or beautiful; and the extremities are heavy and not well marked. He engraved both portrait and history, and executed his plates entirely with the graver. Among his most esteemed works are the following:

Portraits.—Louis Pereira, and Claude de Chabot, envoys to Munster, both in 4to. without the name of the painter; John Leuber, confessor of Dresden, from A. van Woelbergen; pope Urban VIII. giving his benediction; the four heads of the church—St. Jerom, St. Augustin, St. Ambrose, and St. Gregory, all in folio; Jacob Backer, a painter of Holland, in 4to.; and John Bylert, a painter of Utrecht, both from his own pictures; Albert, prince and count of Arenberghe, in large folio, from Vandyke; Lucy Peraye, countess of Carlisle; Anthony of Bourbon, count of Morel, son of Henry IV.; and Honorus Urphée, count of Novi Castellie, &c. all in folio, from Vandyke.

Historical Subjects after various Italian Masters.—"Heliodorus chased from the Temple by Angels," a very large upright print, engraved on two plates, after a drawing by Van Lint, from Raphael's picture in the Vatican; "A dead Christ lying on the Knees of the Virgin Mary;" a large upright plate from An. Carracci; "The Archangel Michael overcoming the Demon," after Guido; "The Reconciliation between Jacob and his Brother," after Rubens, all in large folio; "Christ in the Garden of Olives;" "The expiring Magdalen," supported by angels, both in folio; "The Rape of Hippodamia, or the Combat of the Centaurs and Lapithæ," in large folio, all after Rubens; "A Holy Family," after Theodore Rombout, in folio; "Mary Magdalen and St. Francis at the Feet of Christ;" "The Virgin in the Clouds," both in large folio, from Vandyke; "Rinaldo and Armida," in large folio, after the same painter (the companion was engraved by P. de Jode); "Suzannah at the Bath," after Martyn Pepyn; "The Flagellation," after Diepenbeck; "Christ crowned with Thorns," after the same painter; "The Invention of the Cross, before St. Helena," after Van Lint; "The Emperor Theodosius holding the Cross before St. Ambrose," after the same painter, all in large folio; "Jesus

Christ fastened to a Column," attended by angels, with the instruments of the passion, after John Thomas, in folio; and "St. Anastasius seated in a vaulted Apartment reading," after Rembrandt, a folio print, with a fine effect of light and shadow.

John van Aken was born in Holland, A.D. 1614, and was the fellow-student of Bamboccio. He has frequently been mistaken for John van Aachen, of Cologne, the latter of whom did not engrave.

The following etchings, from the hand of Van Aken, are free and masterly, and in a style much resembling that of J. Both.

A set of six horses, with landscape back-grounds, in 8vo. marked J. V. Aken, fecit. M. de Heineken likewise cuts the two following: a landscape, where a horse appears in the fore-ground saddled, and a man seated on the ground behind it, with only his back seen, and towards the left, another man with his hat on. This is very scarce; and four fine mountainous landscapes, ornamented with figures, wood, and buildings, in folio, both marked with his name, to which is added fecit; and in the latter H. L. inventore.

John Almeloven was born in Holland in the year 1614. He was a painter as well as an engraver; the latter profession he exercised chiefly for the bookellers, but with great credit to himself. His etchings, of which the subjects are principally landscapes, abound with freedom and intelligence. Of these it may be sufficient to mention, in this place,

The *Portrait* of Gisbert Voetius, marked J. Almeloven, inv. et fec.; a set of twelve views of towns and villages, ornamented with figures; a set of six mountainous landscapes, with figures, and the four seasons, from Herman Saftleven, all in quarto.

Matthew Borrekens, or Borekens, was the contemporary and friend of the preceding artist, and resided at Antwerp. He worked chiefly with the graver, in a neat style, resembling in manual execution that of P. Pontius, but his drawing is far less correct.

The principal parts of his works are the copies he made from Bollwert, and other eminent engravers, for Vanden Eaden, of which the best are as follows:

Portraits of Augustus Carpzon, plenipotentiary of Frederic William, duke of Saxony, Anselme van Hulle pinxit, in folio; Gerard Schepeler, plenipotentiary of the peace of Osnabruck, from the same painter; the prelate Christopher Butkens, after Diepenbeck, all in folio.

Historical Subjects, &c.—"Mary Magdalen embracing the Crucifix," accompanied by the Virgin and St. John, after Vandyke, in very large folio; "The Virgin standing upon a Globe, treading on a Serpent," in folio, after Rubens; "St. Francis Xavier," and "St. Ignatius of Loyola," all in folio; "St. Barbara," in large folio, a very rare print; all from Rubens. "Jesus Christ bound," surrounded with angels bearing the instruments of the passions; "The good Shepherd," "The Mystery of the Mats," both in large folio; and the frontispiece to "Butkins's Trophies of the Duchy of Brabant," in folio; all after Diepenbeck.

Andrea Stock was born in Holland, A.D. 1616, and resided the greater part of his life at Antwerp. He was the pupil of Jacques de Gheyn, and imitated his style with tolerable success. His professional talent was of a general nature. He engraved portrait, landscape, and historical subjects, but can scarcely be said to have risen above mediocrity.

His best prints are, the *Portraits* of Albert Durer, in 4to. after Thomas Vinidor de Bologne; Hans Holbein, from a picture by that master, in 4to.; Lucas of Leyden, from a picture

picture by himself, in 4to.; Peter Snayers, after Vandyke, in folio; "Abraham sacrificing Isaac," a large upright, after Rubens; "The twelve Months of the Year," after John Wildens; and a set of eight landscapes, after Paul Bril, all of quarto dimensions. These, with the "Académie de l'Épée" of Thibault, which was published at Antwerp, will probably afford sufficient specimens of the various talents of this engraver.

Antonio Waterloo was born among the scenes which he so admirably represented, in the suburbs of Utrecht, in the year 1618. The events of his life are very little known, but none who have taste and sensibility to appreciate his merits, can read and reflect on that little, without wonder and regret. Though born to a comfortable patrimony, and blessed with an excellent genius, he died in a miserable state, as is reported, in one of the hospitals of Utrecht, at the age of forty!

This seems reproachful either to society or to Waterloo himself: but reproaches may well be allowed to sink in silence, when we know not where they ought to attach. Great talent is often eccentric, and, to all but the eye of philosophy, will seem to shoot madly from the social orbit: that the undeviating sons of Commerce should turn from a bright prodigy to a barometer or a weather-cock, is perfectly natural; meanwhile the meteor glares and expires. Earth is illumined, but are the merchants enriched?

Hundreds of dealers have amassed fortunes, and others will for centuries continue to amass fortunes by selling the works of an artist of our own country, who kept school in Bunhill row, and disposed of his Paradise Lost for almost nothing. Hundreds have in like manner enriched themselves by dealing in the works of Waterloo, who languished and died in an hospital.

"Father forgive them, for they know not what they do," is a divine prayer, which intelligent Christians, in pity to ignorance, cannot too often repeat. Neither know they whom, nor what, they neglect.

Availing our attention, then, from the private life—the frail and mortal part—of this great artist, to works that will live and be admired as long as engraving shall endure, we have to observe, that he was rather an engraver who occasionally painted, than a painter who occasionally engraved; for while his plates are numerous, his pictures are very few. For an account of his merits in the latter art, the reader is referred to the article WATERLOO.

If he had any tutor in engraving, it has escaped record. The woods, the winding roads, and villages in the environs of Utrecht, appear to have been his study, and of many of these his etchings are faithful portraits, rendered with a master's hand and poet's sensibility. The frankness and beauty of his style, shew that he read the book of nature with intuitive readiness; and that the character which was occult to others, was to him easy and familiar.

Gilpin says, that "Waterloo is a name beyond any other in landscape. His subjects are perfectly rural. Simplicity is their characteristic. He selects a few humble objects. A coppice, a corner of a forest, a winding road, or a straggling village: nor does he always introduce an obelisk. His composition is generally good, and his light often well distributed; but his chief merit lies in execution, in which he is a consummate master. Every object that he touches has the character of nature; but he particularly excels in the foliage of trees."

But Waterloo sometimes composes ideal landscapes of a grand and impressive character, though still under the influence of the same presiding simplicity. The scenes to which classic romance, or the solemnities of holy writ have stimu-

lated his imagination, appear to have been produced with a little effort, as the forest glades, or rushy and secluded pools, overhung with alders, or picturesque knolls, which he doubtless drew and etched, just as he saw them in nature.

Of this, his "Tobias and the Angel" may serve as an instance, of which the reverend writer above quoted has, in another place, written as follows. "The landscape I mean is an upright, near twelve inches by ten. On the near ground stands an oak, which forms a diagonal through the print. The second distance is composed of a rising ground, connected with a rock which is covered with shrubs. The oak and the shrubs make a vista, through which appears an extensive view into the country. The figures, which consist of an angel, Tobias, and a dog, are descending a hill, which forms the second distance. The print, with this description, cannot be mistaken. The composition is very pleasing. The trees on the fore-ground, spreading over the top of the print, and sloping to a point at the bottom, give the beautiful form of an inverted pyramid, which, in trees especially, has often a fine effect. To this form, the inclined plane on which the figures stand, and which is beautifully broken, is a good contrast. The rock approaches to a perpendicular, and the distance to an horizontal line. All together make such a combination of beautiful and contrasting lines, that the whole is very pleasing. The keeping is well preserved. The second and third distances are both judiciously managed. The light is well disposed. To prevent heaviness it is introduced upon the tree, both at the top and at the bottom; but it is properly kept down. A mass of shade succeeds over the second distance, and the water. The light breaks in a blaze, on the bottom of the rock, and masses the whole. The trees, shrubs, and upper part of the rock are happily thrown into a middle tint.

"Perhaps the effect of the distant country might have been better, if the light had been kept down; leaving only one easy catching, light upon the town and the rising ground on which it stands.

"The execution is exceedingly beautiful. No artist had a happier manner of expressing trees than Waterloo; and the tree before us is one of his capital works. The shape of it we have already criticised: the bole and ramifications are as beautiful as the shape. The foliage is a matter-piece. Such a union of strength and lightness is rarely found. The extremities are touched with great tenderness; the strong, masses of light are relieved into shadows equally strong; and yet ease and softness are preserved. The fore-ground is highly enriched; and indeed the whole print, and every part of it, is full of art and full of nature."

These remarks from the pen of Mr. Gilpin, on the Tobias of Waterloo, are so pertinent, and so applicable to the generality of his works, that it is only necessary to add that the mode in which these extraordinary prints were produced, is simply *etching*, which he is supposed to have worked up to so powerful an effect of chiaroscuro with his etching needle, by mere dint of drawing and the various pressure of his hand, as to render all *flossing out* (as it is termed) of his lighter tints, unnecessary. His plates are believed to have been *bit in* (or corroded) at one operation of the aquafortis, and not to have been touched afterward with either graver or point.

Some of the foreign writers on art, to whom we are indebted for descriptive catalogues of the works of Waterloo, are, however, of a different opinion, and assert, that after the process of corrosion, he strengthened and enriched his tones, and especially the boles and branches of his trees, with the graver.

The present writer, from the comparisons which he has been

been able to make between various impressions, and his knowledge of the manner in which engraved plates wear under the hand of the printer, is inclined to believe, that the darkest parts of Waterloo's plates, which are generally the overshadowed boles and branches of his trees, would of course begin to wear first, (from the ridges of copper in such parts being either exceedingly minute, or entirely corroded away) and would consequently want retouching before any other parts began perceptibly to wear, which retouching was at that time always performed with the graver, the art of *rebiting* being unknown.

Hence, in collecting the works of this master, it is of the utmost importance to attend to the goodness of the impressions; for the demand for them has been so great, and the plates have in consequence been so frequently retouched, that the latter prints are altogether unworthy of the name of Waterloo. You see in them, indeed, the general forms of the objects, but every trace of the elegant freedom and spontaneous grace of the master, is irrecoverably gone: back-grounds and fore-grounds are jumbled together, and in some instances nothing is left but a few strong, stiff, unmeaning lines on a faint and unintelligible ground.

The high estimation in which the works of this justly celebrated landscape engraver has ever been held, have occasioned frequent republications of his plates, and Huber, Rodt, and Adam Bartsch, of the imperial library at Vienna, have written descriptive catalogues of them, of which the following list is an abridgment. The cypher which Waterloo sometimes affixed to his etchings, may be seen in *Plat. I.* of the monograms, &c. of the engravers of the Netherlands.

Views and Compositions.—A pair, of a ruined building, and a woody recess with two peasants. A set of four, *viz.* the hermitage; the passage of the rocks; the little waterfall; and the mountain bridge, all in octavo. A set of twelve, in quarto; *viz.* the fisherman's return; the arrival of travellers at a country inn; the rustic well; the village mill; the village church; the cattle on the bank of a river; the little bridge, with three anglers; the four peasants; view on the road to Schevelingen; the fisherman, (a river scene); the two towers, (another river scene); and a pastoral landscape, on the fore-ground of which are a goat, ram, and ewe, which Bartsch has attributed to Marc de Bye. The mill dam, and the entrance to a forest, a pair in quarto, are two of Waterloo's early performances, coarsely executed, and evidently done before his powers had attained to maturity. Another set of twelve, of which the subjects are, 1. The fruit trees. 2. The church-yard. 3. The cottage. 4. A view on the sea-shore, on the middle ground of which is a village spire. 5. Another view, with two fishermen. 6. Another view, with cattle and figures in a boat. 7. The traveller and two trees. 8. A pastoral scene, with sheep and a shepherd crossing a bridge. 9. The deserted village. 10. The inhabited village; three peasants are here reposing on a fore-ground hillock. 11. The sentry box. And 12. The stone bridge. Another set of six, in quarto; *viz.* 1. A forest scene, with travellers. 2. A river scene, called "the little bridge." 3. Sheep fording a stream. 4. The boys and a dog, drinking at a brook. 5 and 6. Pastoral landscapes, with shepherds reposing under trees, &c. A pair of cottage scenery, in quarto, with the effects of moonlight and twilight, of the upright form. A set of six, in quarto; *viz.* 1. The rock bridge, over a mountain torrent. 2. The travellers converging. 3. A cottage surrounded with trees. 4. The oak, (under which a male and female peasant are conversing.) 5 and 6. Views from nature, with travellers and their dogs. Another set of six, of the same dimensions; *viz.* 1. The hermit's chapel. 2. The

loaded ass. 3. The sleeping peasant. 4. The streamlet. 5. The mountains. And 6. The wooden bridge. Another set of six, denoted as follows: 1. The forest traveller. 2. The cottage, overshadowed with trees. 3. The entrance of a wood. 4. The gate. 5. The knotty tree. And 6. The forest river. Two other sets, in quarto, of six subjects, each consisting chiefly of rural and forest scenery. [It is to be remarked of these, and of Waterloo's works in general, that while their real merits and beauties reside in the landscape, collectors have, with little justification or reflection, denominated them from the figures which they contain, (which are the worst parts of Waterloo:) so that a grand mountain scene with rocks and cataracts, is sometimes known by the silly title of the *Loy and dog*, or the *milk-maid*.] A set of six grand landscapes of larger dimensions, entitled, 1. The double cascade. 2. The castle and cataract, or triple cascade. 3. Rocks and mountains, with three figures on the fore-ground. 4. A wild mountain scene. 5. The grand waterfall. And 6. C stagers at the foot of a mountain. Another set of six, *viz.* the temple, with a cupola and waterfall in the middle ground. 2. The rock bridge. 3. The large tree, with four figures. 4. Huntsmen in a forest. 5. A pastoral scene, with a shepherd and his flock. 6. A watermill, with a cowherd and cattle. Another set of six, in large quarto; *viz.* 1. A plain, with clumps of trees. 2. The wildfowl hunter. 3. The return from the chase. 4. The traveller by twilight, a forest scene. 5. A river scene, with boys bathing. 6. A forest glade, with figures reposing. Another set of six, in large quarto, all of which are views from nature, chiefly of villagers, but the names of the places have not yet been mentioned. A set of twelve beautiful landscapes in small folio; *viz.* 1. A garden scene. 2. Ruins of a city, with figures and cattle on the fore-ground. 3. The two bridges, (one of which is of stone, and the other of wood.) 4. The castle and rock. 5. The two travellers. 6. The city gate. 7. A river scene, with two stone bridges. 8. A shepherd conducting his flock across a stone bridge. 9. A water-mill in a wood. 10. The skirts of a forest, with a falconer and greyhounds. 11. The pointed tower, a forest scene, with sportsmen reposing. 12. Another forest scene, with three large trees on the fore-ground. Another set of six, in large folio, of forest scenery, with rivolets and rustic bridges, all of which are believed to be views from nature, of places not named. Another set of six, in large folio, and of great beauty, which are numbered and named as follows: 1. A country-inn, with peacocks reclining. 2. A champaign country, with figures in conversation. 3. A woodland scene, with two very small figures. 4. Two trees on the bank of a stream, with an open gate. 5. Another woodland scene, viewed from a corn-field. 6. A plantation of young trees, with a sleeping shepherd on the fore-ground. A set of six large upright landscapes; *viz.* 1. The large windmill, so called, but the mill itself is at a distance, and the near objects are an old house surrounded with trees, and on the left a wooden chapel. 2. A woodland scene, with two peasants and a dog. 3. A mountain scene, with a road winding over a wooden bridge, towards a forest. 4. A village scene, with a woman and children reposing on the fore-ground. 5. The entrance of a wood, with two travellers reposing, and a horseman advancing from among the trees. 6. Another woody scene, with a church spire in the distance. A set of six compositions, in large folio, and of the upright form, with poetical subjects introduced from the heathen mythology; *viz.* 1. Alpheus and Arethusa. 2. Apollo pursuing Daphne. 3. Mercury charming Argus. 4. Pan pursuing Syrinx. 5. Venus and Adonis. And 6. The death.

LOW COUNTRIES, ENGRAVERS OF THE.

of Adonis. Another set of six historical landscapes, in large folio, with subjects from the Old Testament; viz. 1. Abraham dismissing Hagar and Ishmael. 2. Ishmael languishing in the desert, is comforted by an angel. 3. The death of the disobedient prophet. 4. Tobias and the angel, upon which we have commented at length. 5. Zipporah kneeling, executing the divine commands on the son of Moses. And 6. The prophet Elijah fed by ravens in the wilderness; all of which are very grand compositions, and executed in the highest taste of Waterloo.

Egbert van Panderen was born A.D. 1606. He resided, during great part of his life, at Antwerp, but he often added the word *Haerlemensis* to his name, from which we may infer that he was a native of Haerlem. He worked entirely with the graver, in a stiff formal style; and his prints have neither harmony of effect, nor correctness of drawing to recommend them. The following are selected from those most worthy of notice: God, an angel, a man, and the Devil, or "The History of Sickness and Medicine," from Henry Goltzius, in quarto, very rare; "The Virgin Mary interceding with Christ for the Salvation of Mankind," after Rubens, in folio; "The Four Evangelists," half figures, after P. de Jode; "St. Louis, Bishop of Thoulouse," after the same painter. Part of the plates for a large folio volume published at Antwerp, 1628, entitled "*Academie de l'Epee*," by G. Thibault, all of folio size; six engravings of quarto size, of horses, from Ant. Tempesta; "Maurice, prince of Orange, on horseback," after the same painter, in large folio; and "Pallas," "Juno," and "Venus," after Spranger, in circles of folio size.

Theodore van Kessel was born in Holland, A.D. 1620, and, it is probable, was related to the Kessels, who were painters of no small repute in that country. His works, which are rather numerous, consist chiefly of etchings; and (when he did not attempt to draw the human figure,) are by no means devoid of merit, but frequently are executed in a firm and free style. He etched a small folio volume of vases and ornamental compartments, consisting of eight parts, from the designs of Sir Adam de Viane, with his portrait at the beginning. They were published at Utrecht by his son, Christopher de Viane; and almost all the plates are marked with the monogram of the inventor, formed by an A and V joined together, and the initials of the engraver's names, T. V. K. to which F. or fec. is sometimes added: these initials are commonly joined together in a manner represented in *Plate III.* of those used by the engravers of the Low Countries. Several of the plates for the gallery of Teniers, and also the following, were executed by Van Kessel; viz. an etching of the portrait of the emperor Charles V. after Titian, in quarto; "St. Gregory meditating," a half-length figure, executed with the graver, T. Wilbortius inv.; "A Repose during the Flight into Egypt," after Giorgione; "Christ and the Woman of Samaria;" "The Woman taken in Adultery," both from Caracci; "Susannah and the Elders," after Guido; "The Holy Virgin worshipped by Angels," after Van dyke, all of folio dimensions; an allegorical subject, representing "Abundance," in large folio; the companion to which was engraven by P. de Jode, both after Rubens. A set of four bas-reliefs, after the same painter, representing 1. The triumph of Galatea. 2. A Triton embracing a sea nymph. 3. A nymph in the arms of a sea god. And 4. A faun seated near a rock, with two children and a goat. "The Hunting of the Caledonian Boar," a large plate lengthways, is from the same master: a man wheeling a barrow of peas and beans, with a man and woman driving cows, in the back-ground. A landscape, the companion

to the preceding, into which is introduced a girl with milk-pails, both in large folio, are also from Rubens. A set of battles and skirmishes of banditti, after P. Snayers, in folio, dated 1656, must conclude our selection from the works of this engraver.

Abraham Conrad, or Conradus, was a native of Holland, and born in the year 1620. Under what master he studied is not known. He engraved history and portraits, but chiefly the latter; many of which are from his own drawings, and prove him to have been an artist of considerable ability.

His mode of engraving is various, and free from bigotry to any particular style: sometimes he imitated that of Lucas Vorsterman with great success, and at others, a style somewhat resembling some of the heads by Rembrandt, but still more resembling that which has since been adopted by our countryman Worlidge; employing etching, or the work of the graver, or dry needle, as occasion appeared to him to require.

The *Portraits* of Christopher Love; Jacob Triglande, a professor of the university of Leyden; Thomas Mouris, of Canterbury, after D. Boudringeen; and Godefroid Hottot, pastor of the French church at Amsterdam, after H. Mourmans; generally esteemed the very best of the engravings of Conrad, all of folio dimensions.

Of his *Historical* works, "The Flagellation," and "The Crucifixion of our Saviour," both in folio, and after Diepenbeck, are all we are able to specify.

Having already treated of the biography of Bartolomeo, see BREEMBERG; it remains only to mention in this place, that the style of his etchings is scarcely less masterly and intelligent than that of his pictures. They are much sought after by collectors, and good impressions are by no means common. His mark, when he did not sign his name at length, was B. B. F. and sometimes two B's, in the way shewn in *Plate IV.* of monograms used by the engravers of the Netherlands.

We have by the hand of this artist, a set of twenty-four landscapes, with figures and animals, entitled "*Verhuden versallen Gebonden*," with an etching of the portrait of the artist, published in octavo, and also in quarto. Another set of twelve, entitled "*Antiquités de Rome*." A landscape, marked with his cypher. "Joseph distributing Corn, during the Famine in Egypt," in large folio; and its companion, "The Martyrdom of St. Lawrence." There are many good copies from the two last subjects, particularly those etched by Bishop.

Henry Nainwex, Naiwynex, or Naiwikex, of Utrecht, according to some authors, was the disciple of Bartolomeo. He was a landscape engraver of considerable merit: he painted also, and in the cabinets of the connoisseurs of Holland, are drawings in Indian ink by this artist, which are performed with much care, and also with feeling and taste.

His reputation, however, was chiefly founded on his etchings of landscape. He caught the mantle of Waterloo: he was, perhaps, somewhat less free and painter-like, but with regard to evenness of tones, and what is termed engraver-like execution, improved on his prototype.

His works are faithful representations of Nature, and the feeling and delicacy which every where accompanies his etching-needle, has occasioned his prints to be much sought after both by artists and collectors.

Of his etchings we are only acquainted with sixteen, of which the earliest and best impressions are known to dealers by

by their having been taken before the name of Clement de Jonghe was inserted as the publisher; they form two sets in large quarto.

The first set contains, 1. A forest-scene with a fore-ground of oaks. 2. A river-scene with trees, &c. 3. A rocky scene with wood and water. 4. A mountainous landscape with a wooden bridge towards the left. 5. Another mountainous landscape with wood and water. 6. A canal, or river, winding through a rocky country. 7. A river-scene with a village church in the back-ground. 8. Trees and water, with a mountainous distance.

The second set consists also of eight subjects of similar general character, chiefly of mountain scenery.

Naiwinck always etched from his own pictures or drawings, and very rarely introduced any figures into his landscapes.

Herman Swanevelt, or Swaneveld, surnamed Herman (*i.e. the Hermit*), of Italy, was born at Voerden, in Holland, A.D. 1620, and died at Rome 1690. He was the disciple of Gerard Douw, but soon quitted the school of that master, and migrated to Italy, where he placed himself for a while under the instructions of Claude of Lorraine.

But like all artists of original powers, he was much less indebted to any instructor for his acquirements, than to his own unremitting studies from nature.

The recluse life which he led in Italy, and the long and solitary rambles which he took in that classical and romantic country, for the sake of enjoying nature, and contemplating landscape at its purest sources, obtained for him the cognomen of *the hermit*, which, generally speaking, is well sustained in his works, by the retired gloom of his choice of subjects.

For an account of his merits as a painter, the reader is referred to the article SWANEVELT. As an engraver, he was original, bold, and free, always working from his own pictures and drawings, which are either compositions or views from nature, and which he enriched with figures and cattle, that for drawing and appropriate introduction far exceed those of his master Claude.

The general characteristics of his landscapes are wildness and sublimity. He has more of breadth and ordonnance, or the studied graces of landscape composition, than Waterloo, and more of mechanism in his mode of execution, but less of fine feeling and taste. His chiaroscuro is grander, but he possesses less sensibility to the simple graces of nature when viewed in detail. Swanevelt is more symmetrical and wisely arranged, Waterloo more spontaneous. If Swanevelt is more epic, Waterloo is more pastoral. The latter etched what was before him without any seeming effort; the former went abroad to *study*, and studied with effect.

The engravings of Swanevelt are somewhat numerous, and are much sought after; so that good impressions are by no means common. Those most worthy of the attention of the collector are as follows:

A set of eighteen rural subjects, with figures and Italian buildings, in ovals, entitled "*Varie campestri fantasie a Hermano Swanevelt invent. et in lucem editæ*;" a set of thirteen Italian landscapes, including a dedication to Gedeon Tallement, in small quarto; a set of twelve Italian landscapes, enlivened with figures, and entitled "*Diverses Vues dedans et dehors de Rome, dessinées par Herman van Swanevelt, dédiées aux Vertueux*," in quarto; a set of seven, of domestic animals, with landscape back-grounds, in small quarto; a set of four mountainous landscapes, enriched with figures of nymphs and satyrs, in 4to.; four landscapes,

into which are introduced historical subjects, *viz.* "Abraham receiving the three Angels;" "The Angel conducting Tobit;" "Elias in the Wilderness comforted by an Angel;" and "The Angel encouraging Tobit to take the Fish," all of quarto size; a set of six Italian landscapes with figures; another set of the same number, with remarkable buildings and figures; four landscapes, in each of which the Flight into Egypt is variously represented; four views of the Apennines, with rustic figures, all of folio dimensions; a set of four landscapes with figures and animals, in small folio; six landscapes, forming a series, into which the history of Venus and Adonis is introduced, in large folio; and a set of four wild landscapes, with legendary subjects, in large folio, *viz.* "St. Jerome meditating before his Cell;" "A Saviour offering Fruit to St. Anthony in the Desert;" "St. Anthony regaling his Friend St. Pacome;" and "The Death of the Magdalen."

Albert van Everdingen was born at Alkmaar, in Holland, A.D. 1621, and died in the same city in 1675. He frequented successively the schools of Roland Savery and Peter Mlyn, both of whom he soon surpassed. During a voyage in the North sea, he was thrown by a tempest on the coast of Norway, where he resided upwards of twelve months, and employed his time in studying the wild and romantic character of the landscape scenery of that country. He etched with the same picturesque feeling and taste with which, as we have already stated (*see EVERDINGEN*) he painted, and among his works are a set of one hundred small views in Norway, executed with admirable variety, peculiar characteristic wildness, and as much vigour of genius as the cascades of Tivoli, by Salvator Rosa. Most of his engravings are of Norwegian subjects, and are marked sometimes with his initials, and at others with his name at length.

Believing that there is, in our language, no descriptive catalogue of the works of this artist, we shall proceed to specify those most worthy of admiration.

A pair of small oval landscapes of rural character; a pair of very small uprights, one representing a forest with four figures in the Norwegian costume, the other a champaign country with a cottage; four small mountainous landscapes with figures and water; four, in octavo, etched in a very free style, of cottages and figures.

Another set of four, in octavo, of cottages and figures; three marine subjects with vessels and figures, in 4to.

Six mountainous landscapes, with figures, trees, windmills, cottages, &c. in 4to.

A set of three, in quarto, one representing a windmill and sluice; the second a perspective view of a village and church; the third is of wild character, with three peasants and a dog on the fore-ground.

A pair, in quarto, one representing a mountainous scene with fir trees and a hermitage; the other cottages and trees, with a swineherd and two hogs in the fore-ground.

Two woody landscapes, of quarto size, in one are rocks on the fore-ground and cottages; the other is a cottage-scene, with a man and woman in conversation. The four last are (contrary to the custom of Everdingen) lengthways.

A pair of landscapes, in quarto, of rocky character, with fir trees and figures; in the second two figures are seated at the foot of a rock, one of whom writes on a stone the name of Everdingen.

A pair of mountainous landscapes; in one of them is a wooden bridge communicating from one rock to another; the other is a stone bridge communicating with very lofty rocks,

LOW COUNTRIES, ENGRAVERS OF THE.

rocks, across which a pedlar is travelling, in the middle-ground a man is seated, who appears to be drawing.

A pair of woody landscapes, in quarto, with cottages; on the road towards the left hand are two figures and a horse; the other is a rocky scene with trees, in the background is a view of the sea.

A pair of ditto, with the effect of night; one of them is a rocky scene with a cottage and figures; the other is an immense pile of rocks crowned with wood, all of quarto size.

A pair of ditto, one of which represents a monument; the other a cottage and peasants.

A pair of ditto, one is a farm-yard with poultry and figures; the other consists of piles of various trees cut down for building, with two peasants, all in quarto.

A forest scene, a river is winding through the fore-ground, over which an old oak spreads its horizontal arms. Of this engraving there are two sets of impressions, one being less than the other by a third part.

A woody scene with cottages and figures, in the fore-ground is a waterfall with figures angling.

A beautiful cascade formed down the side of a mountain by water which turns a mill; towards the right a peasant is seated on the stump of a tree.

A large wooden bridge with a peasant crossing it; in the middle distance is a cottage and church spire, with a perspective view of a town.

A mountainous landscape with a watermill; on the fore-ground are three figures.

A mountainous scene; on the middle plain is a cottage with oaks and fir trees.

A landscape ornamented with very tasteful figures; towards the right is a monument in the antique style, with columns of the Doric order.

And a landscape, on the fore-ground of which is a Gothic temple, towards which a great number of figures of both sexes are crowding; towards the right is a chapel surmounted with a statue of St. Nicholas, all of large quarto size.

These last eight prints are the most capital of the engravings of Everdingen. He likewise published a set of one hundred views in Norway, and a set of fifty-six octavo plates, from his own designs, from a book entitled "The Tricks, or Deceits of the Fox," which was written by Henry d'Alkmaer.

Nicholas Lauwers was born at Leuse, in Hainault, in the year 1620, but established himself and published his engravings at Antwerp. He emulated the merits of the school of Rubens, and, as Strutt thinks, studied under Paul Pontius, whose style of engraving he for the most part imitated, working with the graver alone. He was, however, by no means equal to that great master, either in his knowledge of forms, powers of delineation, or excellency of handling.

Lauwers engraved after several of the Flemish masters, but his best prints are decidedly those which are from the pictures of Rubens, of which the chief are as follow.

"The Adoration of the Eastern Kings," of the upright form; "The Ecce Homo," of the same form. (Note.—In the latter impressions of this plate, the name of Lauwers is erased, and that of Scheltius a Borswert substituted in its stead, which is probably the trick of some Dutch dealer, which has been put in execution, in order to enhance the nominal value of the impressions.) "The Descent from the Cross," of the same form, and "A Dead Christ on the Lap of the Virgin Mary," all of folio dimensions. "The Triumph of the New Law" is a very large and fine print, lengthways, which Lauwers has engraved on two plates; and

is also after Rubens, as well as his portrait of Isabella, infant of Spain.

There are, however, some few exceptions to our general assertion that the best works of this master are after Rubens. His large print of "Baucis and Philemon entertaining Jupiter and Mercury," (which Strutt has mistakenly attributed to his brother Conrad,) is after Jordāns, and may certainly be classed among his very best productions. His "Holy Virgin and Child," and "St. Agabus," after Diepenbeek, and his "St. Cecilia," and "Interior of a Cabaret," after Seghers, have also considerable merit.

Conrad Lauwers was the elder brother of Nicholas, and worked much in the same style, with the graver only, but with somewhat inferior powers. He was born at Leuse in the year 1613, but resided principally at Antwerp.

The *Portraits* of Aëtius Quellinus, an architect, after J. de Decort; Peter Verbrugghen, a sculptor, after E. Quellinus; Marinus Ambrosius Capello, both of Antwerp, after Diepenbeek; and Father Antony Vinder, after J. Coëffiers, may be reckoned among the best works of Conrad. And his

Historical prints of most reputation are, "The Prophet Elijah visited by an Angel in the Desert," a large upright folio; and "Christ bearing the Cross," both after Rubens; "The Papist of the Emperor and Empress of Morocastapa;" "The Great Crucifixion," after J. Coëffiers, in large folio; and "The Holy Family," in a landscape after Schiavone.

Coryn or Querin Boel, descended from Cornelius, and was related to Peter Boel, the painter. Probably, as there is only three years difference in the dates of their birth, he was the elder brother of the latter.

Coryn was born at Antwerp in the year 1622. He went to Brussels to work for the publication which is commonly called the Gallery of Teniers, which was produced under the patronage of the archduke Leopold. He worked with the graver and etching needle, but chiefly with the latter, his style of handling which, was coarse, heavy, and by no means correct with regard to the forms of his objects.

Yet he had the address to select good originals to engrave from, and his works are *therefore*, we presume, held in some request. The most important of these are, "The Eagle of Jupiter transporting Ganymede through the Air," after Michael Angelo; a landscape after Giorgione, in which are introduced a knight armed with a poignard kneeling before a female; "The Adoration of the Shepherds," after Titian; "Adam and Eve sitting within an Arbour of Paradise," after Paduanino; "Venus and Adonis," after Schiavone; "The Rape of Europa," after Titian; "The Resurrection of Lazarus," after the elder Palma; "Diana and her Nymphs bathing," after the same; "Perseus delivering Andromeda," after Domenico Fetti, all of folio dimensions. And, after Teniers the elder, "The Barber-surgeon Apes," and "Cats performing a Concert;" "The Village Fête," with Dutch peasantry playing at ninepins; "The Interior of a Flemish Cabaret," with a joyous company of drinkers and smokers, all in folio; and a pair of 4to. size, of half-length figures of Dutch peasantry.

Wallrant Vaillant, (who is slightly mentioned in our account of ENGLISH ENGRAVERS as the collector of prince Rupert,) was born at Lille, in Flanders, A.D. 1623, and died at Amsterdam in 1777. He was the eldest of five brothers, of all of them attained some reputation in the arts. Wallrant went to Antwerp, and studied under Erasmus Quellinus; he excelled in portrait painting, and met with great encouragement; for having successfully painted the portrait of the emperor Leopold, his occupation increased so rapidly that

that he soon acquired a competent income. He accompanied the Maréchal de Grammont into France, where he completed his fortune, and after a stay of four years returned to the Netherlands, and settled at Amsterdam. He was an engraver of merit, particularly in mezzotinto; and made some considerable improvement in that branch of art, but the grounds of his plates, when compared with modern productions in mezzotinto, were indifferently laid, and the lights uneven, particularly where they were much scraped. The most important of his works are as follow.

Portraits and Subjects from his own Designs.—His own portrait, and that of his wife, in oval borders, both in folio; prince Rupert; another half-length of prince Rupert, reading, both in 4to.; John Frobenius, a printer of Basle, after Holbein, in folio; sir Antony Vandyke, seated, in large folio; Siniae, a miniature painter, in small folio; Hardouin de Perelx de Beaumont; archbishop of Paris; Cornelius Stadius, rector of the Gymnase at Amsterdam; Conrad Hoppe, a reformer of Amsterdam; a young man seated, reading, supposed to be the portrait of Andrea Vaillant, (a fine and rare engraving); Baarent Graat, a painter of Amsterdam, all of folio dimensions, (the first impressions of the latter plate were printed in brown); Humphredus Henchman, episc. Lond. "An old Woman shewing a Letter to a young One;" "A young Man returned from Hunting, with a Hare and Wild Fowl," both in large folio; "Our Saviour kneeling, surrounded with Angels bearing the Instruments of his Passion," in 4to.; "St. Christopher carrying the Infant Christ across an Arm of the Sea," with the effect of night, in large 4to.; Leopoldus, Dei gratia, Roman; Joannes Philippus, Mogunt; Carolus Ludovicus, comes palat. Rheni et elect.; and Sophia, comit. palat. Rheni, all in folio; these four last portraits are executed with the graver, and are very rare.

Historical, &c. after various Masters.—"St. Barbara," a half figure, after Raphael, in 8vo; "Judith," after Guido, in large folio; "The Holy Family," after Titian; "The Temptation of St. Anthony," after C. Procaccini; built of a warrior, after Tintoretto; "St. Jerome," after a picture by Jac. Vaillant, all of folio size; "Venus lamenting the Death of Adonis," in large folio, from Erasmus Quellinus; a group of three figures, after Terburgh, in folio; "A young Man painting at his easel," after Metz; "Two Boys," after Fr. Hals; "A Child caressing a Dog," after Vandyke; "A Peasant and his Wife," after Teniers; "The Prodigal Son," after Marc Gerard; "A Party of Gamblers," after the same painter; "Judith," and "Jael," from Gerard de Lairesse; "A Party of Peasants," one of whom is smoking, from Corn. Bega; "A Company of Peasants," with a woman and child, after the same painter; "A Party of Peasants singing," from Ad. Brouwer; "Two Peasants smoking," from the same painter; "A Trumpeter Pigeon, delivering a Letter to a Lady," after Wil. Mieris; and "The Gold Weigher," after Rembrandt, all of folio dimensions.

Bernard Vaillant was born at Lille, and was the pupil of his brother Wallerant, whom he accompanied in his travels to Frankfurt and to Paris. He gained considerable reputation as a crayon painter, and scraped some of his own compositions and portraits in mezzotinto, which he signed with his initials. Among them are the

Portraits of John Lingelbach, from Schwarz; Paul Dufour, after a picture by his brother; Eneas Clement, minister at Rotterdam; Charles de Rochfort, minister of the French church at Rotterdam; Paul Dufon, a preacher at Leyden; and heads of St. Peter and St. Paul, all from his own drawings.

VOL. XXI.

Andrea Vaillant was the youngest of the five brothers, and studied engraving at Paris, after having learned the elements of art of his eldest brother. He engraved but few plates, among which are the portraits of Abbot B. Eltopa, patriarch of Alexandria, in large folio; and John Ernest Schrader, inspector of the Gymnasium at Berlin, in 4to.

Francis Poelt was born at Haarlem in the year 1624, and learned the elements of art of John Poelt a painter on glass. In 1647 he went in the suite of prince Maurice of Nassau to America, where he resided for some years, employing a large portion of his time in painting and drawing from nature. After his return to the Low Countries, he made a considerable number of etchings, in a masterly style; among which is a set of views of Brazil, from his own drawings; "View of the Gulf of All Saints in America;" "View of Cape St. Augustin;" and "A View of the Island of Thamarica," all in large folio; the three latter are very capital engravings, and are now become rare.

Cornelius Coning, or Koning, was born at Haarlem, A.D. 1624. He is among those artists who are but little known, and who deserve to be known better. We have some portraits of the illustrious men of the sixteenth century, engraved by him in a firm and pleasing style; but can only specify the following, few; Laurent Coster, the printer of Haarlem, from J. V. Compes; Martin Luther, the reformer, both in large folio; Dierck Philips, theologian; Menno Simons; and Adriaans Tetroolus, of Harlem, from P. Grebber; and some of the princes of Prussia, after Audiceffin, which we are not able to detail, all in folio.

Bernard Baleau, or Bailly, or Van Balen, was a native of the Low Countries, who flourished at Rome during the latter half of the seventeenth century, but the events of his life are obscure, and we are not acquainted with his birth-place; he worked entirely with the graver, in a heavy style, and his portraits, which are the chief of his works, have no great share of merit, either with respect to drawing, or the execution of the engraving. The following are the most important.

Portraits of cardinal Urbin, who was chosen pope in the year 1672; Canute, king of Denmark, after C. Panig; Our Saviour between St. Helena and Mary Magdalen, from Lazaro Baldi; "St. Mary Magdalen de Pazzio," from the same painter, all of folio size; "St. Peter of Alcantara, to whom the Virgin and Infant Saviour are appearing," from the same master; and the five saints canonized by Clement X. viz. "St. Cyprian;" "St. Francis Borgia;" "St. Philip Benetius;" "St. Louis Bertrand;" and "St. Rosa, with the Infant Christ," all in large folio, after Ciro Ferri. This artist likewise engraved many of the plates for a work intitled "Effigies Cardinalium viventium."

Paul Potter, the very celebrated painter and etcher of animals and landscape, was born at Enkhuizen in the year 1625. He was the son and disciple of Peter Potter, a painter of inconsiderable talents, but is far from indebted for his extraordinary attainments to his father's instructions, than to his own assiduous study of nature. No artist has shewn more sensibility to the beauties of rural landscape scenery, or more early and thorough knowledge of the forms and colours of those animals which constitute its most brilliant ornament; the style of none is more simple, original, and unsophisticated; the genius of none shone with a brighter ray, for the short day of his glory, over the paternal and domestic scenery of his native country. He died at Amsterdam A. D. 1654, at the early age of twenty-nine years.

The works of Paul Potter are held in very high estimation. His etchings are greatly and justly admired for the taste, spirit, and simplicity of style which are displayed in

them; and collectors often pay large sums for fine impressions of them.

His prints are original works, *i. e.* done immediately from his own compositions and studies from nature, and are not numerous. But we are uncertain whether or not the following short list contains the whole of his engravings.

A set of five, in small folio, of various horses, with landscape back-grounds. A set of eight, in quarto, of cows and bulls, &c. A mountainous landscape, with a peasant driving cattle, a very fine and rare print, in folio. Another very beautiful landscape, in which a shepherd, surrounded by his flock, is playing on his pipe, also of folio dimensions; and a set of small plates of plants and flowers.

Nicholas Ryckmans, or Richmaus, was born at Antwerp in the year 1620. He was probably the disciple of P. Pontius, whose style he imitated, or rather tried to imitate. He worked with the graver only, in a neat but stiff manner, and the outlines of the naked parts of his figures (the extremities especially), are exceedingly incorrect. The following are among the best of his works, which the merit of Rubens, rather than his own, have recommended to public notice. "The Adoration of the Wise Men," from Rubens, in large folio; the first impressions of which are prior to the insertions of the address of either Gasper Huberti, or Corn. van Merlen. "The Entombing of Christ;" "A Head of Christ;" and "The Holy Family," very rare, all in folio; "Ulysses discovering Achilles at the Court of Lycomedes," in large folio; "Our Saviour and his Thirteen Apostles," half figures, on a set of fourteen leaves, in quarto, all after Rubens; and a work, intitled "Palazzi di Genova, raccolta e designati da P. P. Rubens." It is divided into two parts, representing the plans, elevations, and sections of the principal palaces and churches at Genoa: the first part contains seventy-two plates, and the second sixty-seven. It was first printed at Antwerp in 1622, and reprinted in 1652, and is of large folio dimensions.

Cornelius van Caukerken was born at Antwerp, A. D. 1625, where he established a print-shop of respectability, and engraved several plates from Rubens and other masters. He worked entirely with the graver, in a heavy, laboured style, without much taste. He usually crossed his second strokes squarely upon the first, which mode of engraving requires more exquisite handling of the graver than Caukerken possessed, to render the effect agreeable. His lights are generally too much covered; and his drawing is very defective. However, some of his best prints are by no means devoid of merit: among which number the following may be reckoned.

Portraits.—Peter Snayers, of Antwerp, from Van Heil; Tobias Verhaect, a landscape painter, from Otho-van-ius; Peter Meerte, a portrait painter of Brussels; Robert van den Boeck, a painter of camps, from Gonzales Coques; John de Carandolet; Francis de Faino, baron de Janajo; Charles van den Bosch, bishop of Bruges, in an oval, without the names of the painters, all of quarto size; and Charles II. of England, with a back-ground by Hollar, in large folio.

Historical, &c. after various Masters.—"A dead Christ lying on the Ground, with his Head on the Lap of the Virgin," after Caracci; "A dead Christ, supported by the Holy Virgin and St. John," after Vandvke; "The Descent of the Holy Spirit;" "Charity with three Children," both from the same painter; "Roman Charity," after Rubens, a plate much to be preferred to the other engravings of Caukerken, and of which it is uncommon to find good impressions; "St. Anne and the Virgin," after Rubens, in folio, a rare print; "The Martyrdom of St.

Lievijn," bishop of Ghent, after Rubens, in large folio (those impressions are the best with the address of Hollander); and "A Female suckling a Child," in folio, from Ab. Diepenbeek.

Philip Fruytiers was born at Antwerp in the year 1625. He was originally an oil painter, but afterwards preferred water-colour, and greatly excelled in miniature painting. His works chiefly consist of portraits and conversations, which he executed in a very masterly style. His heads are very expressive, and his draperies well drawn. Rubens was so much pleased with this painter, that he and his family sat to him; and the picture of them, which he painted, was considered as his master-piece.

Fruytiers likewise excelled in etching, which he performed in an intelligent style, worthy of a great printer; and generally produced powerful effects of chiaroscuro. His engravings are not numerous, nor are we able to specify more than the following.

Portraits of Godofredi Wendelini, a philosopher of the seventeenth century, in folio; Marcus Ambrosius Capello, bishop of Antwerp; Jacob Edelherr of Louvain, both in large folio; Hedwige Eleonora, queen of Sweden; and an emblematical subject on the birth of the Virgin, in folio, all from his own pictures.

For an account of the merits of John Eyt as a painter, see vol. xvi. part ii. He flourished at the period which is now under our review, and etched some few plates of animals with his accustomed feeling and vigour, of which the following is a list. A set of eight, in quarto, of various animals. And a set of seven, comprising the title, with a dedication to Don Carlo Gualco, marchese di Solerio, &c. &c. of dogs, with landscape back-grounds, in small folio. Few painters have produced etchings in a more feeling and animated style than this set is executed.

Henry bary was a native of Holland, born A. D. 1626. His style of engraving seems to have been formed from studying the prints of Cornelius Vliether; and the imitation appears most evident in his portraits; especially those which he has executed in his neatest manner. In drawing, taste, and harmony of chiaroscuro, he is frequently deficient; yet sometimes he has discovered much mechanical skill, and seems to have handled his graver with facility. One of his best and most finished prints is "Spring and Summer," personified by two children, a small upright plate, from Vandvke, and executed as a companion to the "Autumn and Winter," engraved by Munichuyten, after G. Lairelle. This plate is executed entirely with the graver, in a clear neat style, and shews his management of that instrument in the most striking light. Among the best of his remaining engravings are the following.

Portraits without the Names of the Painters.—Dirk and Walter Grabeth, painters on glass; Adrian Heerebond, a philosopher; Hieronymus van Bevernink; Didier Erasmus of Rotterdam, all of quarto size; Wilhelm Joseph, baron of Ghent, and admiral of Holland; Roelabout Hagerbeets, both in folio; Anitius Marius Severinus Boetius, in quarto; Jacobus Taurinus; the count John of Waldstein, both in folio; and the dachefs de la Valiere, in large folio.

Portraits signed with the Names of the Painters.—Hugo Grutius, after Michael Judon Mireveldt; Cornelius Ketels, the painter, from a picture by himself, both in quarto; Jacob Backer, the painter, after C. Terburgh, in an oval of folio size; John Schellhammer, minister of Hamburg; John Zas, a reformer of Gouda, from Chr. Pierfon; Jacob Batelier; and Arnold Guitermans, from Weisterbaen, all in folio; Michael de Ruyter, the Dutch admiral, after F. Bol; admiral Vlugh, after B. vander Helst, both in large folio;

Leo van Altzema, a Dutch historian, after J. de Baen, in large folio; and George de Mey, a celebrated theologian, after Coen Diemen, in folio.

Historical, &c.—"Neptune," a quarto plate, engraved from Bary's own composition. An allegorical title page to a work by Leo van Altzema, after Seemer, in folio. A woman suckling an infant, without the painter's name, and perhaps designed by himself. A pair of peasantry, in quarto, after A. Brouwer; the country house-keeper, after P. van Aerlen, in folio. A pair, intitled "Take Care of the Water!" and "Wine makes the People insolent," after F. Mieris, each inscribed also with four Dutch verses, in folio; and "A Youth dressed in a Hat and Feathers," after G. Terburgh, also in folio.

John Munnickhuysen, or Munichuyfen, was a native of Friesland, born A. D. 1636. He resided at Flanders, and executed a considerable number of meritorious works with the graver, among which are the following

Portraits of Hendrick Dircksen Spiegel, a burgo-mailler, a very fine engraving, from J. M. Limburg; Francis Burmann, professor of theology at Utrecht, from C. Maas; Gerard Brand, preacher at Rotterdam, from M. Muscher, all in folio; Peter Zurendonk, rector of the Latin school of Amsterdam, from David Plaats, in large folio; John van Wayen, preacher at Middleburg; Daniel Gravi, a clergyman of the same place, from Z. Blyhof, both in large folio; Peter van Staveren, a clergyman of Leyden, from Wilhelm van Mieris, in folio; admiral Van Tromp, of Holland, a fine portrait, from D. A. Plasse, in large folio; and the companion to Bary's "Spring and Summer;" representing "Autumn and Winter," personified by children, after Vandyke.

Hercules Zeghers, or Zegers, was born at Utrecht in the year 1625. He is spoken of by the author of "Lives of the Dutch Painters, &c." (Deschamps), as having been an artist of fertile invention, but an unfortunate exemplification of the scriptural text, that "the race is not to the swift, nor the battle to the strong, nor riches to men of understanding, nor favour to men of skill."

He both painted and engraved landscape. The above writer says, that his compositions are very rich, and much varied; and that he commonly represented very extensive scenes, with far distant horizons, but met with no patronage or encouragement. Nor was he a whit more fortunate, in this respect, in his etchings, which soon issued forth from the retail shops, as wrappers to other commodities.

The present writer has not seen any of the works of Zeghers, and is inclined to think that Deschamps may have overrated his merits. It is not easy to believe that at Utrecht, in the seventeenth century, good prints would have been depreciated to the value of waste paper; or if a solitary instance or so, of such depreciation had occurred, that very circumstance would have advanced meritorious engravings to some public notice, which must have led towards appreciation, and have finally benefited the artist, however obscure, in spite of the crafty practices of the print-dealers.

That Deschamps was not very observant as a connoisseur, nor very correct as a writer, may be inferred from his statement, that Zeghers discovered the secret of printing in colours upon *canvas*: where, for discovered the secret, we should read, had recourse to the expedient; and for *canvas*, according to the baron Henneken, we should read paper.

The concluding anecdotes related of this artist are probably more worthy of credit and of regret. Hercules made a last, and, according to Deschamps, a stupendous effort, sparing neither time nor pains, nor any kind of exertion of which he was capable, and produced an admirable land-

scape, of which he offered the engraved plate for sale to a print-dealer. The dealer advised him to convert his plate into stuff-boxes; and the artist heard with indignation that he would purchase it at no higher rate than the value of the copper. Zeghers took back his landscape, and, vowing that a half impression should sell for as much as the dealer had offered for the plate, destroyed his engraving in a paroxysm of disappointment. The artist thus verified his vow, and the dealer lost his bargain; but two proofs had been taken from the plate, and they were purchased at the price of fifteen ducats each.

Nothing certain, however, can be inferred from this anecdote, without seeing one of the two impressions from this plate, or hearing some more faithful report of its merits than Deschamps appears to have been qualified to give; since we know not who were the purchasers; and the ignorant part of the tribe of collectors, will often freely give those sums for rarity, which they withheld from meritorious exertion.

Unable longer to endure the scorn and the neglect with which he was treated by the dealers and the public, this unfortunate artist addicted himself to drinking; and, one day returning to his house in a state of intoxication, fell down stairs, and so materially injured himself that he died in a few hours.

It is almost superfluous to add, that the works of Zeghers are very scarce. In the public hall at Dresden are fifteen of his pictures; and another is mentioned by Houbracken, vol. ii. p. 136.

Gerard Valck, the servant, and afterwards the brother-in-law, of Bloteling, was born at Amsterdam in the year 1626. But both these artists migrated to England; and the reader will find an account of them, and their works, in our account of the *Origin and Progress of ENGLISH Engraving*.

Cornelius van Dalen the younger was born at Antwerp in the year 1626. He was the son of a print-seller of the same baptismal name, and, out of distinction, always added the word junior to his name. He is said to have learned engraving of Cornelius Visscher; but his style varied from time to time, resembling, as occasion appeared to him to require, those of Lucas Vorsterman, P. Pontius, S. Bolswert, and other masters. A set of antique statues, engraved by him, are in a bold, free style, as if founded upon that of Goltzius; others, again, seem imitations of that of F. de Poilly. In all these different manners he has succeeded; and they manifest the extraordinary versatility of his powers, and great command he had of the graver: for he worked with that instrument only.

He engraved a great variety of portraits, some of which are very valuable, and form the best, as well as the larger part of his works. He did not succeed so well in drawing the naked parts of the human figure: his outlines are heavy, and frequently incorrect; and the extremities, the feet especially, are seldom well marked. The following are selected from his best engravings:

Portraits.—Queen Catherine of Medicis, seated, a very fine engraving, in large folio; Francis Deleboe Sylvius, a physician, C. V. Dalen del.; John Ruppert van Groenen-dyck, the burgomaster of Leyden; Jacob Baudes Heertoot Wassenaer, lieutenant and admiral; the old, old, very old man, Thomas Parr, aged one hundred and fifty-two, all of large folio size; Eneas Dupré, the theologian, from D. Baudrigeen; Anna Maria Schierman, with six Latin verses, after Van Ceulen; Andrea Rivetus, professor of theology; Frederic Spatheim, from Van Negre, professor of theology, all in folio; James, duke of York and Albany, from San-

Lutichuys; Charles II. of England, companion to the preceding, from the same painter; John Maurice, prince of Nassau, after Gov. Hineck; Maarte Harpertz Tromp, the Dutch admiral, after Liveness; four very fine portraits, after Titian, from the cabinet of Reynst, viz. Peter Aretine, John Boccaccio, George Barberelli, and Sebastian del Piombo, all of large folio dimensions.

Hybrid, &c.—"The Adoration of the Shepherds;" "The Virgin and Infant Christ," both in 4to.; an allegorical engraving, representing a fair leading an ass, and a woman and child lying near a cock, in 4to.; "The four Fathers of the Church," after Rubens, in folio, executed in the style of P. Pontius; "The Graces embellishing a Statue of Nature," after the same painter, a large upright print on two plates. In the execution of this print, he seems to have had an eye to the neater works of S. Boffwert. "A Shepherd crowning a Shepherdess with Flowers," after Callelyn, in 4to.; "The Holy Virgin presenting the Breast to the Infant Christ," after Hineck; "Venus and Cupid;" and a head of a negress, both from the same painter, all in folio; "The four Elements," represented by children, in ovals of quarto size; a concert of four persons; "Giorgione," in large folio, from the cabinet of Reynst; and "The Monument of Admiral Van Tromp," after a marble group by Verhulst, a very rare print, in large folio.

Nicholas van Hoië, or Van Hoy, was born at Antwerp in the year 1626. He was but an indifferent engraver; but, at the death of Francis Leux, was entitled cabinet painter to the emperor of Germany. In conjunction with Steen, Offenback, and other artists equally indifferent with himself, he engraved the collection of pictures, which D. Teniers the younger made for Leopold, archduke of Austria. This collection was published at Antwerp in the year 1660, in folio, consisting of two hundred and forty-three prints, and is usually known by the name of the Gallery of Teniers. The following engravings are likewise by him: "The Virgin and Holy Infant, with St. Jerome," after Baroccio, in 4to.; "Christ and the Woman of Samaria," after Raphael; "The dead Body of Christ extended on the Earth, and the Virgin prostrate before it," from D. Fetti; and "Apollo and the Muses on Mount Parnassus," after Tintoretto, all of folio size.

Richard Collin was born at Luxembourg in the year 1626. He went to Rome to study under Sandrart, from whose drawings he engraved several plates. He afterwards returned to Antwerp; from whence removing to Brussels, he was honoured with the title of engraver to the king of Spain. But in his engravings he seldom exceeded mediocrity. There is a portrait of this artist, with a long inscription in bad French. The following are some of his best engravings:

Portraits of Artus Quellinus, a statuary of Amsterdam; John Philip van Thienen, a flower-painter, both from E. Quellinus, in 4to.; Joachim Sandrart; Cornelius Hazart, a controversialist, both in folio; Bartholomew Murillo, the celebrated painter of Spain; Christian Albert, bishop of Lubeck, both in large folio; Anna Adelhildis, uxor principis de la Tour et Taxis; Claude Francis de la Vieville, abbé of Louvaine, in large folio; Arnold John Philip de Raet van Voont, knight of the order of Christ; and the thirty portraits of the saints of mount Carmel, all in large folio.

Historical, &c.—"Ester before King Ahasuerus," in large folio, from Rubens; "Christ carrying the Cross," after Van Diepenbeck, in folio; "St. Arnold," after the same painter; and "The Sepulchral Monument of Peter Pafqual," both in 4to.

Francis van Neve, or de Neve, was born at Antwerp, A.D. 1627. He studied the works of Rubens and Vanduyke, and afterwards travelled to Italy. He became a landscape-painter of considerable merit, and succeeded remarkably well in introducing small figures into his pictures.

On his return to his native city, Van Neve etched a considerable number of landscapes, into which he introduced historical figures with much judgment. They are executed in a slight, but intelligent style; the effects are very agreeable, and they are all from his own compositions, proving at once the excellency of his taste, and the fertility of his genius. The following are selected from his work, as being the most meritorious.

A pair of mountainous landscapes with buildings, and figures in the costume of the Grecians; a pair of landscapes of the same character, with an angler and two other figures in one, the other has a large tree and a river in the fore-ground, and a man tending sheep at a distance; a pair of pastoral landscapes, with figures in the dress of Arcadian shepherds; a pair of landscapes, into one of which is introduced Diana and Endymion, and in the other Venus and Cupid; and another is Venus reposing on the banks of a river, and Cupid swimming in it; a pair of historical landscapes, in one of which is Narcissus admiring himself; and the other is a pastoral scene, with a shepherd playing the tabor, accompanied with his flock; all of folio dimensions.

Henry Verschuring was born at Gorcum in the year 1627. He learned the rudiments of art under Theodore Govertz, whose school he quitted to study under John Both. From Utrecht, where Both resided, he went to Rome, where he frequented the public academy, and travelled successively to Florence and to Venice. In 1655 he returned to his native country, where he painted battles, skirmishes, and subjects of that kind, with great success; he always imitated nature with much truth, and his compositions abound with wild variety and characteristic spirit.

Verschuring executed a considerable number of slight etchings of skirmishes, military surprisings and pursuits, from his own compositions, of which the present writer is unable to say more than that they are very scarce.

This artist was drowned in a tempest at sea, on the twenty-sixth of April, 1690.

John or Joshua Offenbeck was born at Rotterdam in the year 1627, and became a landscape and cattle-painter, whose merits will be treated under the article *OSSENBECK*.

He travelled successively, either for patronage or improvement, to Frankfurt, Mayence, Ratibon, and Vienna, and in the course of his professional career, executed a considerable number of etchings in a free and painter-like style. Huber thinks they are the production of his leisure, but it may fairly be presumed that at least those which he executed for the gallery of Teniers were done as much for profit as for pleasure.

Among these are "The Death of the Children of Nöbe," after Palma; "The Children of Israel gathering Manna in the Desert," after Tintoret; "Orpheus charming the Brutes," and "The Four Seasons," all after Bassan, and of folio size. Offenbeck is thought to succeed better in etching after the pictures of Bassan, than those of any other master, and the last-mentioned are among his very best prints.

For other publications he produced two sets, of twelve quarto plates each, from his own compositions, of which one set consists chiefly of animals: "A View of the Campo Vaccino," at Rome, and "The Cafarella, near the Gate of St. Sebastian," in the same city; "A Boar-hunt," after Bamberocco, and the chateau of M. de Wenzelbourg, drawn presumptively by himself, all of folio dimensions.

LOW COUNTRIES, ENGRAVERS OF THE.

A set of six large upright folio etchings, entitled "The Gallery of Wenzelbourg," and after Salvator Rosa, Peter de Laer, and St. Vlieger, are of great variety; and "The Representation of a grand Festival given at Vienna," after a picture by Alex. Lantucci, in large folio, is also among the finest and rarest engravings of this master.

Adrian vander Kabel, or Cabel, was born at Ryfwick, near the Hague, A.D. 1631. He was the disciple of John van Goyen, but appears to have formed his style partly from studying the works of Salvator Rosa. He painted and etched landscapes, which were sometimes of pastoral, and at others of marine character, all of which he studied from nature, and imitated her with great accuracy.

The Rev. Mr. Gilpin justly remarks of his etchings, that, "in those which he has studied, and carefully executed, there is great beauty. His manner (style) is loose and masterly. His prints want effect, but abound in freedom. His trees are often particularly well managed: and his small pieces in general are the best of his works."

Among these may be distinguished a set of six quarto landscapes, ornamented with figures and ruined edifices; another set of thirty of mountainous character, with rocks, castles, and cataracts; another set of four, also of romantic character, adorned with figures and ruined fabrics, in folio; a pair of landscapes of the same general character, also in folio; and, in larger folio, another pair of "St. Jerome in the Desert," and "St. Bruno," or, according to Strutt, "St. Anthony," also in a wild and savage landscape. It is remarkable, that in the latter plate the figure of the saint is *engraved*, without any cross-hatchings, in the style of Mellan, and if Strutt's conjecture be right, is inserted by some other artist. The two latter prints are probably the rarest, though not the best, of the prints of Vander Kabel, who died at Lyons in the year 1695.

Jeremiah Falck, or Falk, was born at Dantzic some time about the year 1650. In his youth he travelled to Paris, and studied under Chaveau, but settled afterwards in Holland, where he etched and engraved several plates for the cabinet of Reynlt, in consequence of which he is generally classed with the engravers of the Low Countries. He worked both with the etching-needle and the graver, and engraved history and portrait with considerable success. In the course of his life he visited the courts of Denmark and Sweden, but finally established himself at his native city of Dantzic, where he died at an advanced age.

The number of his plates that are subscribed with his name, with the addition of "Van Stockholmia," shew that he must have remained in Sweden for some years, and have given rise to the suspicion of Strutt, that he was a native of that country. His style of engraving is vigorous and free, and his drawing tolerably correct, but his characters are defective in harmony.

The Abbe Marolles was in possession of ninety-three engravings from the hand of Jeremiah Falck, from which the following may be selected, as affording the best specimens of his abilities; viz. the *Portraits* of Tycho Brahe, inscribed "Non habere sed esse;" William Blaeu, the disciple of Tycho Brahe, a celebrated geographer, both in folio, and from drawings by himself; Constantine Terbor, of Ham-burgh, after Ad. Boy; Andrea de Leizno Lefczynski, bishop of Kaminiac, inscribed J. Falk, Polonius sc.; queen Christina of Sweden; Peter Gembici, bishop of Cracovie, all after his own drawings; Hans Schack, a Danish general, after C. van Mander; Louis de Geor, after David Beck; Leonard, count of Torkensfohn; Axel, count of Oxenstiern; Axel Lilio, a senator of Sweden; Adolphus Johan, prince palatine; Charles Gustavus, prince of Sweden, all after D. Beck,

and in folio; and Adrian Spieghelius, for the folio edition of his work, which was published at Amsterdam, A.D. 1645.

Historical, &c.—A set of "The four Evangelists," half-length figures, in quarto; "A Concert of Music," consisting of four performers, after Gaerckins, engraved for the cabinet of Reynlt, in large folio; "The Virgin and infant Christ, accompanied by St. John," after J. Stella, in folio; "The Cyclops at the Forge," after Michael Angelo; "Esau disposing of his Birthright to Jacob," after Tintoretto; "A Man and Woman singing," from a picture attributed to John Lys, in folio; "The old Coquet at her Toilette," from the same painter; and "St. John preaching in the Desert," after Bloemart, a very capital engraving, both in large folio. The last five engravings were for the cabinet of Reynlt.

John Hackaert, the landscape-painter of Amsterdam, of whom we have treated in our vol. xvii. etched a few plates, about this period, with much ability, and in a style resembling that of Waterloo.

Of these the chief are a set of six quarto plates of simple rural scenes, apparently views from nature. They are etched with taste, and No. 4 is particularly beautiful.

Daniel Stoppendael of Holland was born in the year 1630. In his style of engraving he was a follower of Cornelius Visscher, but, like other *followers*, was always behind.

His principal engravings are, a portrait of Erasmus reading, on a pedestal, in large folio; a set of twelve of figures and animals, in quarto, dated 1651; a collection of sixty views, entitled "Les delices de Diemen Meer," engraved from his own drawings, and another set of thirty-four views in Holland, all of quarto dimensions.

B. Stoppendael, or Stoependaal, was the countryman and contemporary of Daniel. Whether they were related is uncertain. He migrated to England with William III. and his principal works, which are now become scarce, record the events of the revolution, which placed William and Mary on the throne of these kingdoms.

"An Attack of a Convoy of Provisions;" the robbery of a coach, commonly known by the title of "The Pistol Shot," and "The Lime-kiln," were engraved by Stoppendaal, after Visscher's prints from Bamboccio, and are at present more sought after than the originals. "The Departure of William III.;" "The Arrival of that Prince in England;" "His Coronation;" and "His Opening of the Parliament," are of folio size, and from designs by the engraver himself.

Frederic Henry van Hohe was born at Haerlem, A.D. 1630, but migrated to England, and resided chiefly in London, where he was employed by the bookellers, and chiefly by John Dunton. His abilities were not considerable, but at a period when few engravings appeared that were superior to his, it is not to be wondered at that those of Van Hohe should have been held in some degree of estimation.

His prints are dated from 1648 to 1692, in which last year he executed the portrait of king William on horseback, which was prefixed to "The Epitome of War." His best engraving, according to Strutt, is the portrait of Jacob Cornelis, a middling-sized upright plate arched at the top, from C. Visscher, whose style of engraving he has imitated with some little success. The productions of his graver were chiefly portraits, among which are those of sir Edmundbury Godfrey, in folio; and sir Matthew Hale, in quarto. He engraved this last portrait twice, but the smallest is the most esteemed. Several frontispieces and book ornaments, and many of the plates for Quarles's Emblems, are also among the prints of Van Hohe.

The Bouttats were a numerous family of painters and engravers.

engravers. Frederic was born at Antwerp A.D. 1630, and had twenty-four children, of whom twelve were educated to different branches of fine art. Frederic published the works of other engravers as well as his own, and may deserve more credit in the annals of commerce (if such there be) than can be allowed him in those of art. He worked with the graver only, in a neat but dry style; his works are numerous, and consist chiefly of portraits, but their merits are small. From among them the following may be selected with advantage.

The *Portraits* of J. Baptist van Heil, a portrait-painter of Brussels; Daniel van Heil, a landscape-painter; and Leo van Heil, an architect, from pictures by J. Baptist van Heil; David Ryckaert, from a picture by himself; Charles Emanuel, duke of Savoy; Charles Gaspar, elector of Treves; Christina, queen of Sweden; Oliver Cromwell; Frederic-William, elector of Brandenburg; John George, elector of Saxony, all in quarto.

Of his *Historical* engravings—"The Holy Virgin, with St John and the Infant Saviour," and "A Card Party," from a design by himself, are alone worthy of notice.

Gaspar Bouttats was a younger brother of Frederic, who worked chiefly for the Dutch book-sellers. His prints consist chiefly of etching, which he performed without taste, in a tame and rapid style.

Beside his book-plates, which we shall not enumerate, he engraved a few of larger dimensions, among which are, "The Massacre of the Huguenots;" "The Assassination of Henry IV. of France;" and "The Decollation of the Counts Nadasti and Cerini, and the Marquis Francissani," all of large folio size, which, as they are without painters' names, are perhaps designed by himself; and "A Provision Tent," after Wouwermans, also in folio.

Gerard Bouttats was of the same family, and was born A.D. 1634, at Antwerp. He travelled during his youth to Vienna, where he became engraver to the university. His works rise not above mediocrity, and consist principally of portraits from his own drawings: among them are Adamaus Munds; Antonio d'Aumont; Charles Joseph, archduke of Austria; and Don Peter, king of Portugal, all of quarto size.

His best *Historical* prints are, "The Name of Jesus;" and "The Resurrection of our Saviour," both in quarto.

Philibert Bouttats was likewise a native of Antwerp, and one of the sons of Frederic. His engravings are mostly portraits, but are destitute of merit. Among them is pope Innocent XI. in large folio; the dauphin, son of Louis XIV.; and its companion, Mary-Ann Victoria of Bavaria, both in folio ovals; Elizabeth Charlotte, duchess of Orleans; William-Henry, prince of Orange; Christian V. king of Denmark; Herman Werner, bishop of Paderborn, in a circle; Alexander Sidney, ambassador; John Sobieski, king of Poland, all in folio; and a Thesis, with the portrait of the bishop of Munster, in large folio. We pass over Peter Balhafar, and the remainder of this family, as too inconsiderable to be worthy of the reader's attention.

Adrian Lomelin was born at Amiens in the year 1636. He studied the art of engraving at Antwerp, and always resided there. He worked with the graver only, and handled it very indifferently, but, unfortunately, several of the capital pictures of Rubens fell into the hands of this engraver, and his works are here specified chiefly on account of the merits of the originals.

However, some of his portraits after Vandyke are not wholly destitute of merit, and from these the following may, with advantage, be selected.

Charles I. king of England; Ferdinand of Austria, governor of the Low Countries; Jacob le Roi, lord of Herbaix; John Charles de la Faille, a Jesuit of Antwerp; Alexander de la Faille, an Antwerp senator; Zegher van Houtsum, of Antwerp; Adrian Stevens, an ecclesiastic; John Malderus, bishop of Antwerp; John de Wael; and John Baptista de Billohoven, an Antwerp Jesuit. This last is reckoned the very best of the portraits of Lomelin: all are after Vandyke, and of folio dimensions.

Historical. &c.—"Abigail appeasing David;" "The Adoration of the Eastern Kings;" "The Circumcision;" "The Baptism of Christ;" "Mary washing the Feet of Christ;" "Christ appearing to Mary Magdalen;" "The Trinity;" "The Triumph of Charity;" "Time unveiling Truth and conquering Heresy;" "The Assumption;" "The Virgin and Infant Saviour," attended by St. Dominic, and various others, all of large folio size; "St. Cecilia," in folio; "The Judgment of Paris," in large folio, all after Rubens; "Christ taken in the Garden," from Vandyke; and "The Holy Virgin," with the youthful Saviour presenting a crown to four fathers of the church, in folio, after Diapenbeck.

Nicholas Pitau, or Pithau, was born at Antwerp in the year 1633. He was the son and pupil of James Pitau. He travelled to Paris A.D. 1660. Bassan erroneously informs us that he was born in 1664 at Antwerp; and Watelet says at Paris in 1633; Huber and Martini correct these mistakes, and from other authorities it appears certain that he was at Paris the time we have mentioned above, and died there some time about the year 1676. His style of engraving nearly resembles that of Francis de Poilly, though his strokes are more vigorous. His drawing is in general tolerably correct, but, at times, is rather heavy, especially in the extremities of his figures. He worked with the graver only, and appears to have handled that instrument with much facility; but from the sameness of manner with which he has treated his figures, draperies, and back-grounds, the effect of his prints is cold and silvery. Watelet, who generally writes with more taste and feeling than almost any other of the foreign critics on engraving, praises him somewhat too highly, when he asserts that "Pitau's engraving of the Holy Family, after Raphael, is a chef-d'œuvre, both for the beauty of the execution, the purity of the drawing, and the strength and justness of the effect. The character of Raphael has, perhaps, never been so faithfully translated as in this print, which, by amateurs, has been preferred to the famous engraving of the Saint, by Edelinck," which is after the same celebrated master.

This artist engraved both portraits and historical subjects, and the following are selected from his best.

Portraits.—St. Francis of Sales, bishop and prince of Geneva; Louis Henry, duke of Bourbon; Oliver Cromwell, after Vander Werf, all in folio; Alexander VII., after P. Mignard, in large folio; Vincent de Paule, founder of the congregation of the Mission of St. Lazarus, after Sim. François, in folio; James Fabier du Bulay, master of the court of Requests; and Henry Louis Hubert de Montmort, of the French Academy, both in ovals of folio size; Theodore Bignon, master of the court of Requests, all after Ph. de Champagne; Peter Seguier, chancellor of France, from N. de Platte Montagne, in large folio; Prioli, author of the French History; Alexander Paul Pitau, counsellor, both in folio; Gaspar de Fieubet, chancellor; Nicholas Colbert, in large folio, all after C. le Febure; Louis XIV. of France and Navarre; the dauphin, son of Louis XIV. both from le Febure; and an anonymous portrait of a man, half-length, after John Daret, all of large folio size.

Historical, &c.—"The Holy Family," after Raphael, in folio; "The Entombing of Christ," after L. Caracci, in large folio; "The Virgin with the Infant Saviour reading," in an oval, after Guercino; "A dead Christ, with Angels weeping over him," from the same painter; a half figure of "The Virgin with the Infant Christ," in folio; "Jesus Christ in the Clouds, with St. John and the Virgin interceding for St. Bruno," in large folio; "Christ and the Woman of Samaria;" "The penitent Magdalen;" "The Council of St. Sulpitius;" and "The Holy Family," all after Ph. de Champagne, and of folio size. Another "Holy Family," wherein an angel is presenting the infant Saviour with a basket of flowers, after Villagrain; and a large Thetis, after Seb. Bourdon.

Charles or Karel du Jardin was born at Amsterdam in the year 1635, and died at Venice in 1678. He was the disciple of Paul Potter, or, as some authors affirm, of Berghem; and after studying for some years in his native country, made a voyage to Italy, under the pretext of accompanying a friend to Livourne.

Here he was so well pleased, either with the climate and landscape scenery, or the patronage which Italy afforded him, that he continued there for the remainder of his life. As a painter, we have already treated of the merits of Du Jardin. Both as painter and engraver, he added sparkling force to the taste and touch of Berghem. He understood the anatomy of domestic animals, perhaps better than Potter or Berghem. He drew with the utmost freedom, though his drawing is strictly correct. He copied nature simply and exactly, though not servilely; and has given us not only the form, but the characteristic peculiarities also, of each animal. He never indeed, like Hondius, animates his creation with the violence of savage fury: his genius takes a milder turn. In his prints, all is quietness and repose. His dogs, after their exercise, lie stretched at their ease; and the languor of a meridian sun commonly prevails through the piece. His composition is beautiful; and his execution, though neat, is spirited.

Some of his prints are of quarto, and others of folio, dimensions; but they are generally met with bound together in a folio volume, which is highly and justly valued by all persons of taste, and consists of fifty leaves. His subjects are generally landscapes, or pastoral conversations, in which cattle are often the principal objects. Of that which is placed the fifth in the volume, the Rev. Mr. Gilpin has written: "The design, though humble, is beautiful. The two dogs replying at noon, after the labour of the morning, the implements of fowling, the fictitious hedge, and the hoop-holes through it, all correspond, and agreeably tell the little history of the day. The composition also is good. The nets and fowling-pieces are judiciously added, and make an agreeable shape with the dogs. The hedge adds another pyramidal form. The light is well distributed. The drawing and expression are pure nature, and the execution elegant and masterly."

REYSDART, (for an account of the character of whose merits as a painter, see that article,) executed, about this period, some very masterly etchings; they are right, but very picturesque, and may be considered as beautiful sketches from nature. The following are a selection of the best: a very scarce, woody landscape, of very delicate execution, in small 4to.; a sea-view, with vessels, and a mountain towards the left, crowned with trees and buildings, in 4to.; a cottage embosomed in trees, with a wooden bridge, and a peasant and dog, in folio, executed in a broader style; a forest scene, in folio; and a landscape of wild character, with a hovel on the descent of a hill, in folio.

John le Ducq was a native of the Hague, and born in the year 1636. He learned the rudiments of painting of Paul Potter, whose style he imitated with much success. In 1671 Le Ducq was made director of the academy of painting at the Hague, and enjoyed the reputation of a good artist; but after some years he quitted the arts, and entered the military service. Le Ducq executed several etchings from his own designs, with much intelligence and precision; among which is a set of eight quarto plates, of dogs, dated 1654.

Romyn or Romain de Hooghe was born at the Hague in the year 1638; and being a man of genius, and of great fertility of invention, soon distinguished himself both as a designer and engraver. His style of art was singular and extravagant; but the surprise which his designs excited, and the impression which their novelty made on the public mind, occasioned his compositions to be much sought after; and he composed and engraved many of the frontispieces to the books which were at that time printed in Holland.

The Rev. Mr. Gilpin says of him: "Romain de Hooghe is inimitable in execution. Perhaps no master etches in a freer and more spirited manner: there is a richness in it, likewise, which we seldom meet with. His figures, too, are often good; but his composition is generally faulty: it is crowded and confused. He knows little of the effect of light. There is a flutter in him, too, which hurts an eye accustomed to, and pleased with, simplicity."

His prints are generally either historical or allegoric, and among them, "The Deluge at Coeverden" (which, as Mr. Gilpin says, is finely described) has excited much notice.

This Deluge at Coeverden is a small folio print, and is properly an *historical landscape*. De Hooghe had here a country to describe, and a story to tell. The country is the environs of Coeverden, a Dutch town, with an immense bank thrown up against the sea; the story is the ruin of that bank, which was broken through in three places by the violence of a storm. The subject was great and difficult, and the artist has acquitted himself in a masterly manner. The town of Coeverden fills the distant view: the country is overspread with a deluge, the sky with a tempest, and the breaches in the bank appear in all their horror. The composition, in the distant and middle parts, is as pleasing as such an extensive subject can well be. An elevated horizon was necessary to give a distinct view of the whole. The light is thrown over the landscape in good masses; and the degree of flutter, which Mr. Gilpin seems to censure above, was here congenial to the subject. The expression of the figures, of the horses especially, is very strong: those which the driver is turning, to avoid the horrid chain before him, are impressed with the wildest character of terror; and indeed the whole scene of distress, and the horrible confusion in every part of it, are admirably described.

The execution, though good, is inferior to that of some others of the works of De Hooghe; and, with the foreground, a popular critic finds the following fault: The spirit, he says, which the artist has maintained through the rest of the piece, seems here to flag; whereas if he should have closed the whole with some noble confusion, which would have set off the distant parts, and struck the spectator with the strongest images of horror. Instead of this, we are presented with a few pigs and calves shivering in the water. The thought seems borrowed from Ovid. In the midst of a world in ruins,

—"Nat lupus inter oves."

Among the numerous productions of this artist, the following are the most distinguished: Servatus Galenus. Resurrexerunt.

terodamensis Batavus, in folio; admiral Michael Adriaensz de Ruyter, a very fine portrait, in large folio; "The Army of William III. at the Battle of the Boyne," and a medallion of himself and queen Mary, in large folio; "William Henry, prince of Orange, on Horseback, accompanied by the young Princes, entering the City of Amsterdam;" an allegorical subject, relating to prince William Henry; another allegory, in compliment to Leopold II.; "The Marriage of William, Prince of Orange, with the Princess Mary;" "The Entry of the Prince of Orange into London;" "The Coronation of William III. in Westminster Abbey;" "The Flight of James II. into France;" "Louis XIV. receiving James at St. Germain's;" "The Siege of Vienna by the Turks;" "The Return of John III. king of Poland, after defeating the Turks;" "The Siege of Rochester," and "Taking of the Fort of Sheerness," both subjects on one plate; "The Excesses committed by the French Soldiers at Bodegrave, and other Places in Holland;" "The Defeat of the French at Hochlilädt in 1704," with the medallions of prince Eugene and the duke of Marlborough, all of large folio size; "The taking of Constantinople by the Turks," in folio; "The Jews' Synagogue at Amsterdam;" "The taking of Nerva by Charles XII. in the Year 1700;" "The City of Gran, assaulted by the Imperialists," both in large folio; "The Battle of St. Denis," on two large plates; "The Prince of Orange declared Stadtholder of Holland;" "The Arrival of the Prince of Orange at London in 1688," in large folio; twelve plates, illustrative of the fashions of the seventeenth century, invented by De Hooghe, in 4to.; "The Deluge at Coeverden," in folio, (the plate on which we have commented at some length); "The Entry of Louis XIV. into Dunkirk," a large print, lengthways, on two plates, from Vander Meulen; "Charles II. king of Spain, descending from his Carriage to pay Homage to the Host," in folio, from De Hooghe's own composition; "The Massacre of the two De Witts," in folio; an emblematical print, exposing the vices of the monks and other ecclesiastics of the Romish church, a middling-sized plate, lengthways, with the name of Loggan affixed to it, though it is evidently the work of De Hooghe, who, fearful perhaps of affixing his own name, fathered this engraving upon a foreign artist; and "The Fair at Arnheim," in large folio.

Abraham Genoels, surnamed *Archimedes*, was born at Antwerp in the year 1638. He learned the rudiments of art of Jacques Backreel, and afterwards travelled to Paris for improvement, where he was employed by Le Brun and De Seve, and where a royal pension and apartments in the Gobelins were assigned him. From the French metropolis, Genoels travelled to Italy, the common theatre of improvement, and after studying there awhile returned to Paris, with the reputation of an excellent artist. In 1682 he visited his native city, where he died at an advanced age. Genoels executed a considerable number of etchings of landscapes in a free masterly style, ornamented with very good figures and animals; a considerable number of them are from his own designs, and the large ones are particularly excellent. His composition is in general good, though perhaps, in some instances, a little too much crowded with objects. His prints should be viewed as engraved *sketches*, not as translations of finished pictures. This is the limit of their pretension, and thus regarded they are beautiful productions. The monogram of this artist will be found in *Plate IV.* of those used by the artists of the Netherlands.

The following are a selection of the works of Genoels. A pair of mountainous landscapes, with figures and monuments in the antique taste, in 4to; three pair of landscapes of

the same character, and also in 4to; a set of four mountainous landscapes, with water and buildings; four garden views with figures and statues, in 4to; a pair of very fine Italian views, ornamented with figures and statues; an Italian garden, with fountains and figures; a large landscape with a waterfall; and a rocky scene with water, all of large folio dimensions, are generally reckoned to be his very best productions.

James Neefs was born at Antwerp, A. D. 1630, and was probably related to Peter Neefs, the celebrated painter of architecture. He worked principally with the graver, and handled it with great facility. He drew the human figure with some degree of correctness, but in a mannered style. The characters which he has given to the heads of his figures, especially when they required also an animated expression, is often exaggerated.

He engraved both portrait and history, and his best works, though faulty in the above respects, have much merit on the whole. The following are selected as being most worthy the attention of the collector.

Portraits.—Joseph Bergaigne, a Roman prelate, from Th. van Thulden; Gaspar Nenius, bishop of Antwerp, from G. Seghers; John Tollenario, a Flemish Jesuit, from P. Fruytiers; Francis Snyders, the painter, the plate of which was etched by Vandyke, and finished with the graver by Neefs; Anthony de Tassis, from Vandyke; the marchioness of Barlemont, and countess of Egmont; Joshua de Hertoghe, a minister of his Catholic majesty at Ratisbon; Martin Ryckaert, landscape painter at Antwerp, all from Vandyke; Jaan Dolenaris, Jesuit and author of the *Speculum Venitatis*, after Ph. Fruytiers, all of folio size.

Historical, &c.—"The Fall of the Damned;" "Melchizedek presenting Bread and Wine to Abraham;" "Christ on the Cross," all in large folio; "St. Augustin," in folio; "The Martyrdom of St. Thomas;" "The Judgment of Paris;" "The Triumph of Galatea," very rare, all in large folio; "Philippus Prudens, Antwerpia," representing the king of Spain crowned by two geni, in folio; "The Cardinal Infanta of Spain," in folio, all after Rubens; a woman with milk pails, and another with a basket on her head; "Jesus Christ and the six Penitents," after Seghers, in large folio; "Job mal-treated by his Wife," in folio; "The Martyrdom of St. Lievens;" "Jesus Christ appearing to Mary Magdalen," in large folio, after Seghers; "Christ before Pilate," after Jordans; "The Satyr, or the Guest who blew Hot and Cold," in large folio; "A Shepherd and Shepherdess at rural Diversion," both after the same painter, in folio; and "St. Roch interceding for those afflicted with the Plague," after Erasmus Quellinus, in folio.

Anthony Francis Baudins, or Baudouins, was born at Dixmude in the year 1640, and died at Paris in 1700. He was the disciple of Vander Meulen, and con-disciple of Van Hughtenbourg. He etched in a bold, free style, not unlike that afterwards adopted by Chateilain. Baudins executed a great number of plates, most of them from Vander Meulen; the best of which are as follows: a set of six landscapes, in small folio; a set of six, with buildings and figures, dedicated to Ph. de Champagne, in large folio; a set of eight, of buildings and figures; a hunt of hinds, dedicated to the marquis of Louvois; a stag hunt, a very rich composition; a large landscape, into which is introduced the march of the king to Vincennes, dedicated to Le Brun; a landscape, with the march of the queen to Versailles, dedicated to the duke de Noailles; a view of Besançon, on two plates; view of the city of Arras, in Picardy; view of the city of Gray in Franche Comte; the city of Bethune in Artois, on two plates; a view of St. Lawrence de la Roche,

Roche, in Franche Compté; the castle of Jeux, on the frontiers of Franche Compté; the castle of Versailles, as it was formerly; another view of the same castle as it is at present; the castle of Vincennes on the park side; the castle of Fontainebleau, on two plates; and two fine Italian garden views, after Genoels, all of them of very large folio dimensions.

Michael Mouzin, or Mosyn, was born at Amsterdam in the year 1636. In the execution of his plates he united the point and the graver, but not successfully, for his style is heavy and laboured, and his drawing incorrect. The following are extracted from his works as being most worthy of notice. Admiral van Wassenaer, of Holland, in 4to. oval; admiral Ruyter, after H. van Alde, in folio; Cornelius de Witt, after the same painter, in large folio; John van Galen; a Dutch admiral, from Livens, in large folio; a couchant Venus, after Jac. Ad. Backer; the four elements under the empire of Venus, from Holstien, in large folio; a group of children dancing to the music of a tambourin and triangle, played by a woman and satyr; another group of three children dancing; and a satyr presenting a bunch of grapes to a female and child, all after Holstien, in folio.

Jacob van Meurs was born at Amsterdam, A. D. 1640, but is rather an obscure artist. He chiefly engraved book plates and ornaments, and some few portraits in a neat stiff style, among which are portraits of Nicholas Copernicus, the astronomer; Sibrandus Franciscus Eydelshemius, from T. Faber, both in 4to.; professor George Calixtus, in folio; Henry van Dieft, doctor of theology, from Glauwe, in a quarto oval, and Charles II. of England, in folio, from Ant. Vandyke.

Levinus Cruylus, or Lewin Cruyl, was born at Ghent in the year 1640, but embraced the ecclesiastical life, and resided at Rome. He drew and etched a considerable number of views in Rome, enriched with figures and buildings in a very intelligent pleasing style. Many of his drawings were engraved by Julius Testa, and we have also some very fine etchings by himself, that are marked with a monogram which will be found in *Plate IV.* of those used by the engravers of the Low Countries. Of those the chief are a set of twenty-three views of Rome, ancient and modern, in large folio; and another very large set of Roman views, with buildings and figures.

Peter Philippe, an artist of small account, was a native of Holland, born some time about the year 1640. He engraved portraits, among which the following, though without possessing much merit, are probably the best.

A half-length of Louis Henry, prince of Nassau, in folio; prince Henry Charles de la Tremouille, after Vander Bane; the assembly of the States General of Holland, after J. Toornaeck; and a Dutch banquet, after the same painter, all of large folio size.

Peter van Schuppen was born at Antwerp in the year 1623. Of whom he learned the earlier rudiments of art is not known, but he completed his studies at Paris, whither he was invited at the same time with Edelinck, by the minister Colbert. His juvenile talents must therefore have been of high promise.

At Paris, he very judiciously placed himself under the instruction of Nanteuil; here he became justly celebrated both for the number and merit of his engravings, and here he died at an advanced age, A. D. 1702.

He engraved a considerable number of portraits, chiefly from his own drawings, and in a style which proves him to have been a man of considerable talent. The following are a selection of his best portraits, some of which are very fine.

VOL. XXI.

Claudius de Lingendes, in 4to.; Joannes Verrius, doctor of theology, after Loir; Samuel Bochart; Gilles Ménage, from de Pillis; and Nicholas le Camus, all in folio; Renard, cardinal of Elte, and bishop of Reggio, in large folio; Anne de Courtenay, consort of Maximilian, duke of Sully; Francis Pithou, juris consulte, and Peter Pithou, his brother, all in folio; Anthony Chasse, prior of the monastery of St. Vedast; Peter Mercier, a general, all in folio; Francis Villani, bishop of Tournay, from L. François; Anne Adolphe, baroness of Pautersen, from the same painter, both in large folio; Claude Bazin of Beson, from le Febure, in folio; Louisa Mary Armand de Simianes, countess of Lyons; Louis le Pelletier, a parliamentary minister, from Nicholas de Largilliere; Francis van Meulen, the painter; and the prince of Wales, both from the same painter; Julius, cardinal Mazarine, from Nic. Mignard; Louis XIV. in a laurel border of oval form, from le Brun; the chancellor Seguier, from le Brun; Maximilian Henry, elector of Cologne, from Bartholet Flamel; Bernard de Foix, duke of Valette, from P. Mignard; Philip Despont, doctor of theology, from his own painting, all of large folio dimensions.

Historical, &c.—"The Holy Virgin seated, with the Infant Christ," in an oval border of olive leaves, after Raphael, dated 1661, in folio; "The Holy Family, with St. John, who holds a Dove," from Seb. Bourdon. The earliest impressions are before the nudity of the infant was covered with drapery. "The Holy Family," after Gaspar de Crayer; another "Holy Family," the same, except that the figure of St. Joseph is erased; "St. Sebastian, with an Angel drawing an Arrow from his Body," after Vandyke, all in large folio: and "King David," after Ph. Champagne, in folio.

The reader has probably already perceived that we are now arrived at a period, when the natural operation of commerce had tamed down engraving to the trading level, and an engraver rarely appeared in the Low Countries worthy of particular notice, though *workmen* of that profession swarmed both in Holland and in Flanders.

The principle of the rapid acquisition of pecuniary profit, which is the main spring of trade, seems to be essentially at variance with all the nobler pursuits of art and science. An extraordinary artist—a phenomenon—may indeed now and then appear under such circumstances; as Mr. Bird, in our own times, has stepped majestically forth—the painter of pathetic sentiment—from the tea-board manufactories of Birmingham; but the general principles of trade are not to be the less regarded as destructive, or at least deeply injurious in their tendency, to all lofty intellectual effort, and all philosophical enquiry into those principles, on which improvement in art and science may be perpetuated. To be exercised with honour and advantage to a nation, fine art has ever required a nobler impulse and more fostering care, than the short-sightedness of commerce has been inclined or prompted to bestow. The golden eggs of art are never laid fall enough for the cupidity of dealers. And the Cyclopædia might blush to detail the records of some engravers, who found a degree of favour and protection with the print-sellers, which the word patronage was sometimes prostituted to express, merely because they *worked cheap*, and worked *submissively*.

Among these obsequious tools, the engraver who would be content to afford the merchant the largest share of profit, it became his interest to hold forth to the public, or to that part of the senseless herd on whom Fortune showers her favours in her moments of caprice, as the best artist. Disheartened by preferences so unprincipled, the engraver of

modest merit would retire in silence, and either change his profession, or, if he were unable to do this, would look round for refuge where he might.

Several of those of the Low Countries, who lived at this period, sought an asylum in England. Bouyed up by hope, perhaps attracted by false representations of our national taste or prosperity, they failed hither over a sea of Disappointment. They imagined an Hesperian garden, and found a sterile waste. They escaped from the rapacity of one set of dealers, to drudge under task-masters that were more tasteless, and probably not less inexorable; and that fine ethereal mental effluence, which is the spirit of art, was evaporated, partly by the ardours of trade, and partly by the agitations of political revolution.

We, therefore, shall pass slightly over the dregs of Dutch engraving, with some regret on account of the nature of chronologic annals, and reserve the remains of our particular attention for Houbraeken, Audenaerd, Punt, and a few other artists of deserved celebrity, with which must be closed our account of the school of the Low Countries.

Conrad Waumans was born at Antwerp in the year 1630, and became the disciple of Peter Bailliu. He unfortunately imitated his master, when much better models might have been found, and his drawing is not less incorrect, and his style of handling his graver scarcely a whit more principled. Yet he is the engraver of a considerable number of plates, which collectors have thought worthy of some attention. The chief of these are the

Portraits of John Both, (the landscape painter and engraver,) after Willars; Herman Saftleven; David Baille of Leyden, and Cornelius Jansen, both from pictures by that distinguished artist, and all of 4to. dimensions. In folio he engraved the marquis of Mirabelle; Emily, princess of Orange; Frederic Henry, prince of Orange, clad in armour; and Maria Clara, princess de Croye; all after Vandyke.

Historical, &c.—"The Descent from the Cross," in large folio; "The Assumption of the Virgin," in 4to.; "The Holy Virgin and Infant Saviour," in folio; "The Holy Family with the abbé Alexander Scaglia receiving the Benediction of St. John;" and "Venus and Mars," in large folio; all after Rubens.

The family of Danckert, or Dankerts of Antwerp, though they maintained their station as dealers in that commercial city for upwards of a century, were as artists, and speaking of them in the aggregate, scarcely of superior pretensions to those of Waumans.

Cornelius was born at Amsterdam in the year 1561, and established himself as a printseller at Antwerp some time about the middle period of his life. In his youth he produced a few meritorious prints, but (either by choice or necessity) his talents as an artist were gradually absorbed by the craft and sollicitudes of trade.

The *Portraits* of Gustavus Adolphus, king of Sweden; Jacob Wassenaer, earl of Obfida; Cornelius de Wit; John Casimir, count of Nassau; John Calvin; and Peter Molinæus, all of folio dimensions, are among the best of his engravings; to which the collector may add the following few *Historical* plates.

Equestrian figures of "Ninus," "Cyrus," "Alexander," and "Cæsar," with emblematical accompaniments, in large folio. A set of "The Seven Planets;" another of "The Seven Wonders of the World;" another of "The Twelve Sybils," in large quarto, all from his own designs; and "Meleager presenting the Boar's Head to Atalanta," from Picou.

Daukcert Dankerts was the son of Cornelius, and was

born at Antwerp some time about the commencement of the seventeenth century. He was educated to engraving, but he was educated also to commerce, and succeeded his father as a printseller.

He engraved portrait and landscape, mingling in his technical practice the work of the etching needle with that of the graver. In his style of treating landscapes, pastorals, and cattle, he imitated Berghem and Visscher, but presented us with little more than the *caput mortuum* of their abilities. He gradually fell into a dry and heavy habit of crossing his first courses of lines with square second courses, and the taste and intimate knowledge of forms by which those great masters are distinguished, were in Dankerts utterly extinct.

He engraved chiefly after Berghem, and his best productions are "The Hartengaft," or Stag-hunt; "Het Vinkebaantze," or, the Bird Catcher, both in large folio. A set of four large landscapes of pastoral subjects, of which one has the effect of moon light. Another set of four, with cattle and figures, of somewhat small dimensions. Another set of six, of similar subjects, and a set of four, in folio, of which the title-page bears the inscription "Danckert Danckerts fecit et excut." cut on a stone, all from the pictures of Berghem.

Of his *Historical* prints we need only mention "The Departure of Charles II. for England;" "Venus, Cupid, and Satyr," and a fountain with fishermen. There is also a print, which bears his name, of a curious crystal vase, which was found in the treasury at Vienna; and his most esteemed portraits are those of Charles II. of England, and Bernard, earl of Martenitz.

John Danckerts was of Amsterdam, and of the same family with the preceding artist; the year of his birth has not been recorded, but soon after the middle of the seventeenth century he emigrated to England, where he engraved several plates after Titian and other masters, and where he is said to have produced the designs for the English translation of Juvenal, which were engraved by Hollar.

Justin Danckerts was of the same family, and was also a printseller of Amsterdam. He engraved the portraits of William, prince of Orange, and Casimir, king of Poland; a Venus and sleeping Cupid, and a set of the seven gates of Antwerp; more than which it would be needless to specify of works so utterly worthless as productions of art.

Henry Danckerts was brother to John, and was likewise educated an engraver, but quitted that profession to take up the pallet and pencils. He excelled in painting landscape, and travelled to Italy for improvement, where he resided during some time; from thence he came into England, and was patronized by Charles II. who employed him to paint views of the royal palaces, and the sea-ports of England and Wales. These works are dated 1678 and 1679. At the discovery of the Popish plot, being a Roman Catholic, and probably a suspected character, he returned to Amsterdam, where he soon afterwards died.

The following are the most important of his engravings: *Portraits* of king Charles II.; Ewald Serevelius; and Christian Rompf, (both physicians to the prince of Orange,) in large folio; a set of the sea-ports and palaces of England, and a large view, engraved on three plates, of the Y at Amsterdam.

Simon Vlieger was born at Amsterdam in the year 1612. He studied painting under Vander Velde the younger, and excelled in representing landscapes and sea-views. This artist likewise etched several pastoral subjects, ornamented with figures and animals, in a style which combined that of

Rembrandt

Rembrandt with the spirit of Van Uden. The mark which he frequently affixed to his engravings will be found in our *Plate IV.* of those used by the artists of the Netherlands: and the following is a selection of his best works.

A landscape, with a barge unloading on the banks of a river; a pair of landscapes, with trees, water, and figures, in quarto, executed in a very delicate style; a fish-market, with figures; a Dutch inn; a landscape, with water and ruins; and another landscape, with a number of turkeys on the foreground, all of folio size.

Valentine le Febvre, or Le Febure, was born at Brussels in the year 1642. In his youth he went to Venice to study the works of Titian and Veronese, and acquired some reputation as a painter. But his engravings, in general, are feeble, and want harmony; and the naked parts of his figures are heavy and mannered. He, however, handled the point with great facility, and produced good effects of chiaroscuro.

In the year 1680, a set of fifty engravings, by this artist, appeared at Vienna, entitled "*Opera selectiora, quæ Titianus Vecellius Cadabrienfis, et Paulus Calliari Veronenfis invenerunt et pinxerunt; quæque Valentinus le Febre Bruxellensis delineavit et sculpsit.*" In 1682, another edition was published, and in 1749 a third, with the plates retouched by John Adam Schweighart, of Nuremberg.

John Francis Milet, surnamed *Francisco*, was born at Antwerp in the year 1644. He was of French extraction, and becoming the disciple of Lorenzo Frank, was instructed to imitate the learned and admirable style of Poussin.

He became a painter and engraver of epic and heroic landscape; travelled to Paris, and from thence to England, where he left some testimonials of his merit as an artist. On his return to Paris he was elected a professor in the French academy, and ended his days in that metropolis, in the year 1680, leaving behind him several children, of whom two became painters.

The engravings of Francisco are justly regarded with some interest by connoisseurs. D'Argenville mentions the subjects of only three, but the following are all after his compositions, and have every appearance of being the productions of the same hand.

An heroic landscape, with Egyptian edifices, "*The Nile, and Moses floating in the Ark of Bulrushes.*" Another, with the story of Cephalus and Procris; a mountainous scene, with buildings and figures in the taste of Poussin; another with pastoral figures; another with figures bathing; another, in which is introduced the story of the woman of Canaan; an Italian garden scene with a bridge and figures, and a pair of upright landscapes, with ruined buildings and figures in the costume of antiquity, all of large folio dimensions.

Cornelius Vermeulen was born at Antwerp in the year 1644. He travelled to Paris for professional improvement, and resided there for some years, but at length returned to his native country, and died there in 1702.

He handled the graver with judgment, his chiaroscuro is tolerably good, and his style of manual execution possesses considerable neatness and clearness; but he did not understand the human figure correctly enough to excel in historical subjects, and his *portraits* are therefore his best works.

From these the collector may with advantage select those of queen Elizabeth; Anne Boleyn; Catherine Howard; and Oliver Cromwell, all after Vander Werf; John Baptist Boyer d'Aquilles; Louis de Clermont, bishop of Leon; Henry Meyercron, envoy to the court of Denmark from France, all in folio; Maria Louisa d'Orleans, duchess of

Montpensier, in an oval; Louis de Luxembourg, marshal of France; Peter Vincent Bertin; Bardo Bardi Magalotti, a Florentine gentleman; Joseph Roettiers, a medal engraver, all from H. Rigaud; Philip V. of France; Maximilian Emanuel, elector of Bavaria; Nicholas de Latina, marshal of France; Agnes Frances Lelouchier, countess of Arco, all after J. Vivier, in large folio; Louis Urban le Fevre de Caumartin, master of the Requests, from F. de Troy, in folio; Francis Brunet, president of the grand council, and Mezetin Angelo Constantine, both after the same painter; Maria Louisa de Tassis and Nicholas vander Borcht, both after Vandyke.

These are his principal portraits, which are all of folio dimensions. His few *historical* engravings that are worthy of notice, are "*Erigone, with Bacchus under the Form of a Bunch of Grapes,*" in folio, after Guido. One of Rubens's Luxembourg gallery, from the Life of Queen Mary de Medicis, and a courtly allegory of "*Louis XIV. conquering Heresy,*" from a marble group, by Le Conte, both of folio size.

Adam van Zylvelt was born at Amsterdam, A.D. 1645; under what master he studied is not known, but he evidently imitated the style of John Visscher. His principal works consist of portraits, in the execution of which he rarely went beyond mediocrity, and of these the chief are Coornhaert the engraver, in 4to.; Stephen le Moine, a theologian of Leyden; Christopher Wittichus, professor of the Leyden academy, and Herman Wittius, a theologian; all from J. Heyman, and all of folio size.

Albert Meyeringh was a painter and engraver of landscape and ornament. He was born at Amsterdam in the year 1635, and died in that city in 1714.

Albert learned the rudiments of art of his father Frederic Meyeringh, but owed the degree of excellence to which he attained rather to his own genius, and his friendship with Polydore, who was his fellow student. In his youth he travelled through France, and from thence to Italy for improvement. Here he first became acquainted with Polydore, and here for ten years the two friends pursued their studies together.

Meyeringh now returned to Holland, and was much employed in painting the ceilings and other decorative parts of various public edifices. He also painted landscape, and etched several folio plates, all from his own compositions, in a free and painter-like style. Their subjects consist chiefly, like those of the etchings of his friend Polydore, of rocky mountains, cataracts, and other romantic landscape scenery, adorned with cattle, figures, and ruined edifices.

Of the superior merits and general biography of John Glauber, the reader will find an account under the article *POLYDORE*. The etchings of this master are performed in a slight style, and their chiaroscuro is but feeble. Yet are they valuable, on account of the classic or pastoral beauties of his composition.

He in general etched after his own pictures, but he produced one classic landscape with rocks and waterfalls after Poussin, and his allegorical set of the revolutions of the four great nations of antiquity, which is intitled "*Statum Assyriorum, Perlarum, Græcorum, et Romanorum,*" is after Gerard Lairefle, as is also "*Abishag before David.*" All the prints of Polydore are of folio dimensions.

John Bisschop, or Episcopiüs, was born at the Hague in the year 1646, and died at Amsterdam in 1686. He owed his excellence as an artist entirely to his own genius, having never studied under any master. He made designs in distemper with great taste, and which are beautifully finished; and his etchings are very much esteemed by connoisseurs,

they are harmonised with the graver, and though slight, are free, intelligent, and pleasing. He imparts richness to his tones, and roundness to his figures, far beyond what is usually done with the point, to little assisted as it is in the prints of Bisschop by the graver. His figures in general are drawn with ability, yet in a mannered rather than a correct style. The extremities, indeed, are not always well marked, nor his heads equally expressive or beautiful.

His most considerable work is intitled "*Paradigmata graphices variorum artiplicum tabulis Æneis*," Hague 1672, in folio. Two editions of this work were published in the same year, one by the artist, consisting of one hundred and two plates; the other contains one hundred and thirteen, and was published by Nic. Visscher. As they differ essentially, the curious are generally desirous of possessing both.

The mark used by this artist was a J and E, because he latinised his name, substituting Episcopus for Bisschop: this monogram will be found in *Plate IV.* of those used by the artists of the Netherlands.

The remainder of the engravings by Bisschop, are "Christ and the Woman of Samaria," in large folio, after Annibale Caracci; "Joseph distributing Corn to the Egyptians," in large folio, from Bartholomew Bruinberge; "The Martyrdom of St. Lawrence," its companion, from the same painter. A large book from the drawings of the great masters; and a book of statues.

John van Hugtenburg, or Huchtenbourg, was born at Haerlem, A.D. 1646, and died at Amsterdam in 1733. He studied painting under John Wyck, and afterwards went to Italy for improvement, and resided a considerable time at Rome. On his return he visited Paris, and often painted on the same canvas with Van der Meulen, though his style bears resemblance to that of Wouvermans. Hugtenburg excelled in painting battles, encampments, sieges, &c.; and was employed by prince Eugene to paint and engrave the battles and sieges he so fortunately conducted. This artist not only characterised the different nations he represented by the costume, but by the general physiognomy of his figures.

He likewise etched a considerable number of plates in a slight, spirited style, with great freedom, and in a way which manifests the hand of a master. The figures, horses, and other principal objects, are executed with peculiar feeling and ability.

The work which he executed from the pictures which he painted for prince Eugene is usually bound up in a large folio volume, with historical explanations by M. J. Dumont. They were published at the Hague in 1725, on the frontispiece is inscribed "*Dessaintes et gravées en taille douce, par le Sieur Jean Huchtenbourg*." This work is curious and considerable, but is not considered as containing his best engravings; he likewise scraped mezzotinto a good deal, but his performances in that art are not so good as his etchings; and it is very difficult to find good impressions.

When this artist did not sign his name at length, he substituted his initials, in the manner expressed in *Plate IV.* of those used by the engravers of the Netherlands. The following are considered as some of his best engravings.

"Travellers halting before a Forge," in folio; "William III. reviewing his Army near Arnheim," in large folio; a set of eight oval prints, in 4to., representing marches, encampments, battles, &c.; a set of four mountainous landscapes with figures; "Hunters resting," in a woody landscape, in large folio; all from his own pictures. "A combat of Cavalry," in large folio, after Van der Meulen; another "Combat of Cavalry," dedicated to duke Charles

Albert of Chevreuse, in large folio; "The City of Lisse, invested by the French Army," on two large folio plates; "The taking of Dole," in large folio, on two plates; "The March of Louis XIV. and his Retinue, over the Pont-neuf to the Palace," in large folio; all after Van der Meulen. "The Battle between the French and Germans in Italy," in large folio, after D. Hoogstraten; and "The grand Procession of Horses in Holland," dedicated to Frederic William, son of the king of Prussia, in large folio. These two last are etched, and then harmonised with the graver, and are very capital performances.

Mezzotintos from his own Designs.—"Two Cavaliers mauling;" "Two Horse Soldiers dismounting before a Victualling Tent," both in folio; "A Halt before an Inn;" "Departure for Hunting;" "A Combat of Horse Soldiers;" another "Combat of Cavalry;" and "The Imperial Cavalry fighting against the Turks," all in large folio.

Peter Schenck was one of those who regarded engraving as a trade, or means of obtaining money, merely; and on whom it is fruitless to dwell. He was born at Elberfeld, A.D. 1645; became a printseller of Amsterdam, and died at Leipzig in 1711.

While he continued to engrave, he was a mere working-man of industry. Sometimes he scraped mezzotinto portraits; and sometimes he etched views; but both were very indifferently performed. Those of his productions which are best entitled to notice, are the

Mezzotintos of Petrus Schenck, after J. P. Feuerling, in folio; another portrait of Peter Schenck, seated at table with his wife, in large folio; Martin Luther; Gottfried Keck, after D. Richter; Gerard Laureffe; Philip Jacob Spener, theologist; John Oleraris; Peter de Witt, a divine, after Muris; Simon Schynvoet, an architect of Amsterdam; William Henry, prince of Orange; Charles XI. and Charles XII. kings of Sweden; built of the Virgin; "A Criminal confessing to a Monk;" "A young Woman confessing to a Monk;" "Death playing the Violin, and presenting himself to a Man," inscribed "Mortis ingrata Musica," all of folio size.

John vander Bruggen was another who merged the artist in the tradesman. He was born at Brussels, A.D. 1649; and worked for some time in his native country, but afterwards went to Paris, where he established himself as a print-seller. In 1698 he published the works of La Fage, with the portrait of that artist engraved by himself in mezzotinto, after Largilliere.

There is a great number of mezzotintos by Vander Bruggen, which, though not entirely destitute of merit, are such as do him no great honour as an artist. The mark which he frequently used will be found in our *Plate IV.* of those used by the engravers of the Low Countries.

The following are the most important of his engravings. The portrait of himself after Largilliere; Antony Vandyke; and the portrait of Louis le Grand, all in folio. "The Gold weigher," after Rembrandt; "An old Woman weighing Gold;" "A Man seated, with a Goblet in his Hand;" "A Man leaning against a Table, and a Woman behind him scolding;" "A Man seated under a Tree lighting his Pipe;" "A Man sleeping, and another standing near him;" "Cupid and Psyche sleeping;" a large skull, inscribed "Memento mori;" "An old Man in a Public-house, with a Girl playing the Flute;" "A Party of Peasants in a Public-house, smoking and drinking;" both the latter are after Teniers; and all are of quarto dimensions.

Susanna vander Bruggen was doubtless related to this artist, and engraved some few plates of no great merit, after Vandyke and Rubens.

LOW COUNTRIES, ENGRAVERS OF THE.

John Luycken, or Luyken, was born at Amsterdam some time about the middle of the seventeenth century, and died in that city in the year 1712. He studied the arts under Martin Zaagmoelen. Baſſan ſays of his prints, "we remark in them a fertility of genius, joined with great ſpirit, judgment, and facility of execution, he is the Callot, the Della Bella, and the Le Clerc of Holland." But this is ſaying a great deal too much. He neither drew ſo correctly, nor etched in ſo clear and determined a ſtyle as either of thoſe diſtinguiſhed engravers. It is true there are few of his prints, into which he has not introduced a great number of figures, but the groups are ſeldom artfully managed; the lights, for want of harmony, and being too much ſcattered, confuſe the ſubject, and fatigue the eye. This is ſpeaking of them, however, only comparatively; conſidering them by themſelves they poſſeſs great merit.

He chiefly engraved after his own deſigns, and the moſt conſiderable of his works is the large bible, which was published by Montier in two folio volumes, and the following.

A ſet of "The Ten Commandments," in 8vo.; a ſet of ſeventeen, of "The Hiſtory of Lapland and Finland," in 4to.; a ſet of ſeventeen views, &c. which accompany the Eaſtern Travels of M. Thevenot, in 4to. The hiſtory of William III. king of England, in 8vo.; "The Republic of the Hebrews," in twenty-eight plates, in 8vo. and 4to. "The Theatre of Martyrs," from the time of Jeſus Chriſt, to modern times, in a ſet of one hundred and five plates, in 4to.; "The Prophet Jonas, preaching to the Ninevites," in large folio; "The Aſſaſſination of Henry IV. of France," in folio; "The Flight of the Reformers at the Revocation of the Ediſt of Nantes," in large folio; "The Maſſacre of St. Bartholomew, or the Death of admiral Coligny," a very capital print, engraved on two large folio plates.

Gaspar, or Caſpar Luycken, was the ſon of John Luycken, mentioned in the preceding article, and was born at Amsterdam in the year 1660. He learned engraving from his father, and deſigned and engraved a conſiderable number of plates; but his works are neither ſo numerous nor ſo meritorious as thoſe of his father, whoſe ſtyle he imitated. Among them the following will probably be found moſt worthy of ſelection. "St. Francis Xavier preaching before the Emperor of Japan;" "The Jeſuit Miſſionaries obtaining Audience of the Emperor of China;" "The Emperor Joſeph I. receiving the Holy Sacrament;" "The Miracle of the Five Loaves," all of large folio ſize; "The Twelve Months of the Year;" "The Four Seasons;" and "The Grand Roman Cabinet;" all in folio.

Paul van Somer was born in Holland, A.D. 1649. He reſided during ſome time at Paris, and afterwards came to London. He etched, engraved, and ſcraped in mezzotinto, but his works in either art do him no great credit; among them the following are moſt worthy of attention.

"Tobit burying the Dead," in large folio, from Sebaſtian Bourdon; "Moſes found in the Ark of Bulruſhes," after Pouſſin; "The Baptiſm of our Saviour," after the ſame painter, both in folio; "Nil placet, &c." or the fable of the old man and his aſs, after Grifſier, on a ſet of fix folio plates.

From his own Compoſitions.—"The Holy Family;" "The Adoration of the Shepherds," both in folio; "A Ruſtic Converſation of Four Peaſants," in large folio. The four parts of the day, on 4to. plates, viz. "The Morning," (Cephalus at the chace;) "Noon Day," (Arethuſa bathing in the river Alpheus;) "The Afternoon," (Diana and Acteon;) and "The Evening," (Pyramus and Thisbe.)

The two following are in *mezzotinto*. "The Counteſs

of Meath," after Mignard; and "An Officer and Girl in converſation," both in folio.

John van Somer was born in Holland in the year 1640, and was probably related to Matthias van Somer, who, according to profeſſor Chriſt, engraved a ſet of landſcapes. John engraved in mezzotinto, and with the graver, but did not much exceed mediocrity. The following are ſome of his beſt productions. Antony Gregatus, profeſſor of theology at Heidelberg; Daniel Saeſſe, theologift, both in 4to.; Charles Louis, elector of Bavaria; Michael Adriaſt, admiral of the United Provinces, a fine portrait, in large folio, from Du Jardin; "Three Peaſants drinking in an Alehouſe," from J. Both; "Dutch Smokers," after Oſtade; "A Dutch Concert," from Teniers; "A Man filling his Pipe, and a Girl drinking," from Gerard Terburgh, all in folio; "The Angels appearing to Abraham," in large folio, from Laſtman; and "A Party of Pleaſure," from his own deſign.

S. A. Van Lamſweerde was a native of Utrecht, born ſome time about the year 1650; but he appears to have been an artiſt of no great merit. He engraved portraits ſomewhat in the ſtyle of Syderhoef, among which the following are moſt worthy of notice.

Francis Gomarius, a theologian of Bruges, in folio; Henry Alting d'Emſden, a theologian of Heidelberg, in 4to.; Anna Maria Schurman, in folio; Cyprian Regnier, a juris conſulte, at Utrecht, after Gerard Duffeit; and Charles de Maets, profeſſor of theology at Utrecht, after Hendrick Bloemaert; both in large folio.

John Lamſvelt was born at Utrecht in the year 1660. He was probably a diſciple of Romain de Hooghe, whoſe ſtyle he has tried to imitate. His principal works are portraits, part of which he engraved for the hiſtory of Louis XIII., by Michael le Vaſſor, among which the following are the moſt important. A Head of Oliver Cromwell, in an oval of quarto ſize; John de Wit; Cornelius Pieterſzoon Hoof; George Caſſander; Hubert Duiſhuis, of Rotterdam; all rare and much fought after by connoiſſeurs; and a large folio engraving of "The Siege of Tournay, by the duke of Marlborough and prince Eugene."

John Verkolie was born at Amsterdam in the year 1650, and died at Delft in 1693. He became an artiſt owing to an accident he met with in his youth, which obliged him to keep his bed for three years, during which time he amused himſelf with copying pictures and drawings; he acquired the rudiments of perſpective from books, and he ſoon tried to paint in oil, without any other inſtructions. He afterwards became the diſciple of John Lievens, and ſtudied with aſſiduity the pictures of Van Zyle. Verkolie reſided at Delft, where he was obliged to employ great part of his time in painting portraits, but he likewiſe ſucceeded in hiſtorical and converſational ſubjects. He amused himſelf with ſcraping in mezzotinto, which was then but recently diſcovered; and the prints which he executed are much ſuperior to what might have been expected at ſo early a period. The following *Portraits* are ſome of his beſt productions in that art.

Himſelf, after De Leeuw, in 8vo.; Steſſan Wolters, from P. Kneller, in quarto; Joſias van de Kapelle, a clergyman of Leyden; Cornelius van Aeken, a clergyman of Delft; William Henry, prince of Orange; and Hortenſia de Mancini, duchefs of Mazarin, after Lely, all in folio.

Various Hiſtorical Subjects, &c.—"Jupiter and Calisto," from G. Netscher, (the companion to "A Shepherd and Shepherdſs," by G. Valek, from the ſame painter); "Venus

and

and Adonis," from his own composition, companion to "Cephalus and Procris," engraved by Broedelet, after Gerard Hoet; "Venus and Cupid;" "Pan and Flora;" "A young Man and Girl conversing," from Ochtenvelt, all of folio size.

Nicholas Verkolie was born at Delft in 1673, and was the son of the preceding artist. He became the pupil of his father, and succeeded in painting historical subjects and portraits. He was also celebrated for his Indian ink drawings, which he finished with great delicacy. Nicholas learned the art of mezzotinto scraping from his father, and practised it with still more success. The following are some of his best engravings.

Portraits.—Nicholas Verkolie, from a picture by himself; the painter drawing from a model; the amateur Moëllards with a folio, all in quarto; John Peter Zomer, a connoisseur, holding a print in his hand, from A. Booner. Some few impressions were taken from this plate, without the print, which is held by Van Zomer; but these are exceedingly rare; Martin van Bockelin, from his own picture; and Bernard Picart, after Nattier, all in folio.

Various, from his own Designs, and after other Masters.—"The Holy Family," after A. vander Werff; "Diana and Endymion;" and its companion, "Bacchus and Ariadne," both in folio; "A Shepherd caressing a Shepherdess," in large folio, all after G. Netscher; "An Entertainment in a Garden," in folio, after J. B. Weninx; "Two Men drinking and smoking," after A. Matham, in large folio; "A Youth asleep on a Girl's Lap," from his own design; "A young Girl and her Lover having their Fortunes told," "An old Man seated in a Garden, with a Girl, who holds a Miniature in her Hand," both in folio. Heads of a man and woman laughing; a lap-dog playing on a chair; and two dogs at play, all in quarto, very delicate engravings.

Solomon Savery was born at Amsterdam soon after the middle of the 17th century, and by some writers is said, with great probability, to have resided during part of his life in England. Under what master he studied, if under any, is not known; but he handled his graver with a degree of vigour, feeling, and characteristic touch which proclaims original powers. The mechanical exactness and regularity of his hatchings, he, with great address, rendered subservient to his art of expressing the several surfaces which so beautifully diversify the ample face of nature: his chiaroscuro is sufficiently powerful; and if the graver was not the sole instrument of his art, he very rarely employed the point.

He produced a few historical subjects; but his chief excellence lay in portrait engraving, and he seems to have been partial to such heads as were covered with hats, either because he engraved the high-crowned hat, which was then in fashion, with considerable ability, or because he believed that so broad a mass of darkness which these hats afforded, gave effect to his faces.

His principal *Portraits* are those of doctor Camphuysen, surrounded by an olive wreath, and three allegorical figures, after C. Calleyn; Simon Episcopius, and Andrea Calvius, after Cuyp; Isaac Saaly of Ziriczee; John Speed, the English chronicler, with his hat on, a very excellent plate; king Charles I. with a high-crowned hat, the face of which portrait is believed to have been taken from a picture by Vandyke, and the hat and the other accompaniments added by Savery himself; and Thomas, lord Fairfax, also with a hat on, all of folio size.

Historical Subjects, &c.—"Christ expelling the Money-lenders from the Temple," in large folio. A man's head with mustachios and short curly hair, both after Rembrandt.

A grand entertainment given on the water, in honour of Mary of Medicis, after S. Vlioger, (which belongs to a set of engravings that were published at Amsterdam in the year 1638, and entitled "Medicea Hofpes.") A grand procession, in large folio, after M. de Jonghe; and a set of seventeen etchings, of which the subjects are taken from Ovid's *Metamorphoses*, after F. Cleyn.

Thomas Wyck, The dore Maes, Julius François, (surnamed *Horizonti*), Louis Deyster, Charles de Moor, and Richard and John van Orley, were Dutch and Flemish painters, who lived at this period, some of whom performed a few etchings, and others of whom scraped a few mezzotintos.

The etchings of Wyck are small, but free and delicate. Fourteen of them, which were in the possession of Mariette, and were sold at his auction for three hundred and six livres and six sous, are probably all that Wyck ever produced. They consist of pastoral and military subjects, and are all from his own compositions.

In those of Maes, much of painter-like intelligence may be discerned. "The Holy Virgin and Infant Christ, attended by two Angels;" and a set of small plates, of cavalry skirmishing, &c. are all that we know of from the needle of this artist.

The etchings of Horizonti, like those beautiful water-colour pictures with far distant and sweetly-painted horizons, from which he obtained his cognomen, are landscapes in which Tivoli and the Campania of Italy are frequent features.

Deyster filled up some of his hours of seclusion with etching and mezzotinto scraping; and his productions in these arts partake of the character of his genius as a painter, of which we have already treated. Among them is a set of four landscapes, in rather a grand style, of quarto size, which are rare and much esteemed.

The excellence of De Moor lay in portraiture. He etched, in a spirited manner, the heads of his master, Gerard Douw, Van Goyen, and Mieris, and he also, according to Bassan, scraped a few plates in mezzotinto, of which we know not the subjects.

Richard van Orley was born at Brussels, A. D. 1652, and died in the same city in 1732. He learned the elements of art of his father, who was a landscape painter of no great eminence. He began by painting miniatures; but feeling a desire to gain a more elevated station in art, he studied in the schools of design with great assiduity, and became an historical painter of no mean talent.

He likewise executed a considerable number of etchings in a slight coarse style, and which, in some instances at least, are defective in point of drawing; among them, the following are the most meritorious.

"The Marriage of Joseph and the Virgin," after Lucas Giordano, in folio; "The Fall of the rebel Angels," a large folio print, from Rubens; "A drunken Bacchus, supported by Satyrs," from the same painter; and "Vertumnus and Pomona," all in folio. A set of twelve, in octavo, from Guarini's "Pastor Fido." A set of twenty-eight folio plates, lengthways, taken from the New Testament, from drawings by John van Orley.

John van Orley was the brother of Richard, and did not distinguish himself less as an artist; he frequently made drawings from pictures for the latter to engrave after; and likewise assisted in engraving the set from the New Testament, after his own designs.

John Gole was born at Amsterdam about the year 1660. He worked with the graver in strokes, and scraped several mezz-

mezzotintos. His works are numerous, but not very estimable. On the whole, those appear to be the best which are executed with the graver. A few of the best of his engravings, in each manner, are specified below.

Line Engraving.—Charles XI., king of Sweden; the dukes de la Valliere; the unfortunate Grand Vizier; Kara Mustapha; Mahomet IV., emperor of the Turks; Abraham Hellenbroek, a clergyman; the head of a man of letters, in an oval; Nicolas Colvius, a clergyman of Amsterdam, after B. Vaillant, all of folio size.

Mezzotinto Engravings.—Bernard Somer; John Oyers; and Jacob Gole (juris consulte), the latter after D. Plaes; George Augustus, prince royal and elector of Brunswick, after Hirfman; Charles III. king of Spain; admiral Van Tromp; Charles, landgrave of Hesse-Cassel; Balthasar Becker, author of the *Enchanted World*; "Peasants smoking round a Fire," after Oskade. "A Group of three Peasants in an Ale-house, one of whom plays the Violin," after Brouwer; "The Tooth-drawer," after Temers, all in folio; "The School-master," after Hemskerk; and "Heracitus deploring the Misery of human Nature," after C. Dufart, both in quarto.

John Groenvelt, or Groenvelt, was born at the Hague in the year 1650. He etched a considerable number of plates, after Berghem, Van Goyen, Lingelbach, and other masters, which are much esteemed; and a few portraits, in which the faces are almost entirely stippled. His general style of manual execution is neat, but somewhat stiff; and the following are specified as being some of the best of his engravings.

"Dorothea, countess of Sunderland," after Vandyke, in folio; "A Girl with a Cat," after Bloemaert, in quarto; "The Adoration of the Eastern Kings," after P. Veronese; "Christ before Pontius Pilate," after Andrea Schiavone; and, "A Man asleep on a Tub," all of folio size; a set of six landscapes, after Berghem; and another set of four, after the same master, of quarto size, the subjects of which are various pastoral incidents.

Arnold Houbraken was born at Dordrecht in the year 1660, and died at Amsterdam in 1719. He studied under various masters, and lastly under Samuel de Hoogstraeten; he painted portraits and historical subjects; and is the author of a work in the Dutch language, entitled "The Great Theatre of the Dutch and Flemish Painters, by Arnold Houbraken, with their portraits, engraved by himself." According to our countryman Strutt, Houbraken came into England, and made drawings from the pictures of Vandyke, which were afterwards engraved by Peter van Gunt, and he received one hundred guineas for every drawing. He executed several slight etchings, with great intelligence, from his own designs; which are much sought after by amateurs. His heads of the painters are engraved, with much taste, in ornamental borders, with several on one plate; and the following are likewise by him: A set of etchings of boys and vases; "Vertumnus and Pomona," an emblematical subject, representing three women looking at a child in a sort of basket, or cradle, encircled by a serpent; and "The Disciples at Emmaus," in the style of Rembrandt, all in quarto, and from his own compositions.

James, or Jacob Houbraken, was an engraver of admirable talent, to whom England is largely indebted for perpetuating, and diffusing through Europe, the portraits of several of her most illustrious poets, statesmen, and warriors. He was born at Dordrecht in the year 1698, and was the son of Arnold, of whom we have treated in the preceding article. He dated many of his productions from Amsterdam,

which seems to afford evidence of his long residence there, but he died in his native city in the year 1780.

Houbraken had no other master than his father, but his genius, and the study which he bestowed on the best portraits of Nanteuil and Edelinck, superceded instruction, or rendered it superfluous. Strutt thinks, and with much of the appearance of reason, that he formed his style of engraving more particularly, by an attentive study of that portrait of Le Brun, which is engraved by Edelinck, and prefixed to his battles of Alexander. However this may have been, his very high rank, as an engraver of portraits, was soon acknowledged through Europe, and has called forth the just encomiums of Watteau, of Gilpin, of Martini, and of Strutt. In the collection of portraits of illustrious men, which was published in London by J. and P. Knapton, which perhaps, on the whole, may be esteemed the principal work of Houbraken; the surrounding accompaniments are said to have been designed and engraved by Gravelot. These accompaniments are etched with considerable taste and energy, and form an harmonious and very agreeable contrast, to the rich and deep-toned softness and more elaborate execution of the portraits themselves, to which they are kept in due subordination. In some of his foreign productions, however, Houbraken has himself opposed, in a similar manner, though not perhaps with quite equal success, the picturesque wildness and roughness of etching, to the more polished sweetness and mellowness of his dry needle and graver, and even in the laced ruffs and other ornamental parts of the dresses of his English portraits, he has contrived to mingle a small portion of etching with enviable success. But his chief strength lay in the truth and taste of his drawing, and the vigour and delicacy with which, as occasion required, he handled his graver. Sometimes, in the same production, may be beheld the boldest courses of mellow lines,—as in the armour of his portrait of the marquis of Montrose, after Vandyke,—blended and harmonized, with admirable address, with the utmost sweetness and delicacy of execution in the face and hair.

The monarch, or parliament, who could prevent engravers from affixing their names to any other than their own productions, would probably perform a most essential service to engraving as an art. The demands of commerce will have the matter otherwise. The cupidity of gain, in all trading places, fulfils the purity of an honourable love of fame, and damps the ardour of disinterested exertion. In the age and country in which it was the fortune of Houbraken to be placed, he was almost of necessity subject to this baneful influence: and his name accordingly appears to some engravings that are certainly in parts, if not altogether, the productions of inferior men. He who would measure the true standard of the merits of this distinguished artist, or form a just estimate of his attainments, should look at early impressions, (not such as are now common in the London shops, and taken from the retouched plates,) of the portraits of sir Thomas More, Hamden, Schomberg, the earls of Arlington and Bedford, the duke of Richmond, and some others in the same valuable volume.

Strutt is more critically observant in commenting on the works of Houbraken, than in most other parts of his biographical dictionary. He details the interest with which he regarded these portraits, with feeling; and exemplifies the comparison which he made between Houbraken and those admired portrait engravers who stand foremost in the school of France, by an elegant analogy.

After admiring the softness and delicacy of execution, good drawing, and fine taste, which are displayed in the works of Houbraken, he says, "If his best performances have

have ever been surpassed, it is in the masterly determination of the features, which we find in the works of Nanteuil, Edelinck, and Drevet: this gives an animation to the countenance, more easily to be felt than described. From his solicitude to avoid the appearance of an outline, he seems frequently to have neglected the little sharpnesses of light and shadow, which not only appear in Nature, but, like the accidental semitones in music, raise a pleasing sensation in the mind, in proportion as the variation is judiciously managed. For want of attention to this essential beauty, many of his celebrated productions have a milky appearance, and do not strike the eye with the force we might expect when we consider the excellence of the engraving."

The biographer here certainly touches his instrument with a finger of exquisite feeling: yet, as the wild music which should accompany and aid the varying sentiment of mental emotion, is of a distinct character from that Lydian measure and those dulcet tones, that

—————"Sooth the soul to pleasure ;"

so Strutt must not be supposed to mean that one particular style of engraving is suited, in preference to all others, to portraits of every kind, and engraved after whatever painter. The present writer entertains little doubt but that the semi-demi distinctions which he perceives between the styles of different engravers, analogous to those which are noted in music, will one day be so generally felt and understood by professors, and finally by the public at large, as to become the subject of critical admeasurement and animadversion; and when that day of pleasure shall arrive, the softness and sweetness, and delicate indelibility which addresses the fancy rather than the sense, which confers that exquisite melting roundness to which female and infantile beauty is so much indebted; which may be traced in the style of Houbraken, and which, in our own times, has played among the zephyrs, the loves, and the graces of Cipriani and Bartolozzi, will be as much admired, when properly introduced, as the more energetic touches of manly character and expression, or "little sharpnesses" which our English critic has described with a feeling so technically just.

Comparisons might, doubtless, be severally instituted with advantage to our critical knowledge of portrait engraving, between the Dutch artist and those great ornaments of the French school whom Strutt has named, but it would perhaps lead us into too wide a field for the present occasion. To compare him with Drevet alone: his works, though less elaborate, are scarcely less highly finished, and are more mellow and free. Drevet seemed always approximating toward an ideal standard of perfection in which exactitude should blend with truth and the graces, and the peculiar taste, and even the redundant ornaments of Rigaud, the portrait painter of a showy and luxurious, rather than a tasteful age, are sedulously rendered: Houbraken, disguising every appearance of solicitude, is always masterly and free, and always like the painter after whom he works, whether it be Holbein, Vandyke, or Lely. Drevet transcended all his predecessors, and left posterity to wonder at his powers of execution, and despair of attaining them: Houbraken is more practically meritorious; when we see one of his portraits, we believe, as we admire it, that the same hand and mind might have accomplished many, whereas, when we behold the St. Bernard, or archbishop of Paris, of Drevet, we think that scarcely less than a life could have been bestowed on them, and that he who has engraved these plates has done enough for one man, if he has done no more. If Drevet appears to defy competition, he does so with a stretch of careful attention, and a share of

manual and visual power, which we cannot but admire, whereas Houbraken is always easy, and always successful, when he does not allow a substitute to handle his graver. He appears, in his works, to have lived to be eminently and extensively useful; the spectator cannot regard one of his portraits, without supposing that he must, or knowing that he might, have done many; because he perceives that the artist knew the point where an high degree of excellence might, with practical advantage, stop short of the elaborate precision, and recondite beauty of executive detail, which is displayed in the portraits of Drevet.

The following list contains the whole of the works of Houbraken with which we are acquainted.

Portraits in Folio.—A half-length of himself, after Quinkhard, dated 1749; Arnold Houbraken, the father of Jacob; William VIII. landgrave of Hesse Cassel; Jacob van Hoorn, who married, for the fourth time, at the age of ninety-seven, a young woman of twenty-three; and its companion, his last wife, Jacoba van Sellied; Albert Seba, of Erzeel, in Oostfrise, member of the Academy of Natural Curiosities at Amsterdam; John Burmann, doctor of medicine; Francis Burmann, of Utrecht, theologian; Gustavus William, baron of Imhof; Peter Muschenbroeck, professor of medicine at Leyden, all after Quinkhard; George, lord Anson, after J. Wanderlaar; Ferdinand van Collen, a burgomaster of Amsterdam; Gerard Arnout, a burgomaster; Herman Alexander Roell, theologian, both from the same painter; Peter Burman, professor at Utrecht, after Herman van der My, or Myn; Jerome Gaubius, a physician; John Conrad Rucker, a juris consulte, both from the same painter; George I. king of England; Thurlow, secretary to Oliver Cromwell; and Thomas, lord Fairfax, both after Cooper; Catherine Howard, queen of Henry VIII.; sir Thomas More, the chancellor, both from Holbein, the latter a very celebrated engraving; William James Sgravefande, a mathematician, after Vandyke; William Russell, duke of Bedford, from the same painter; George Villiers, duke of Buckingham, after C. Johnson; Sigbert Havercamp, professor at Leyden, after F. Mieris; Mary Stuart, consort of William III. prince of Orange, after G. Netscher; John de Witt, grand pensionary of Holland, from C. Netscher; John Rodolphus Faesch, of Basle, from J. R. Huber; lieutenant-general Talmash, after sir Godfrey Kneller; Anthony, duke of Shaftesbury, after sir Peter Lely; Mary Louisa, of Hesse Cassel, from B. Accama; Henrietta Wolters, from a picture by herself; Cornelius Froost, the painter of Amsterdam; Jacob Compo Weyerman, from C. Froost; Nicholas Verkolie, from a picture by himself; Herman Schyn, schoolmaster, from Henrietta Wolters, called Van Peeue, all in quarto; Christian Gottlieb Glafey, after P. Salice; John Mannekemolen, after Schouman; the czar, Peter the Great; William VIII. landgrave of Hesse Cassel; and William, prince of Orange, all of folio dimensions.

Historical, &c. after C. Froost.—"The Grandmother," from the cabinet of Pinto, at Amsterdam, in large folio; "Avarice deceived," from the cabinet of Vander Mark, of Leyden, in folio; "The Festival of St. Nicholas," from the cabinet of Muilman, at Amsterdam; "The Cymbal Player," a grand composition, from the cabinet of Verchuring; "The Fair at Amsterdam," from the cabinet of Neyman; "Tartuffe, the Impostor," from the cabinet of Braamecamps, all in large folio. And the two following for the Dresden gallery; "Daniel Barbaro," a Venetian nobleman, after P. Veronese, in folio; and "The Sacrifice of Manoah," in large folio, after Rembrandt.

John van Vianen, of Amsterdam, was also a portrait engraver,

engraver, but of talents very inferior to those of Houbraken. He was born in the year 1660. He drew portraits from the life in a manner which has the reputation of accuracy, but his style of engraving, though neat, is tasteless.

Among his portraits are those of John Turretin, of Geneva; Augustus Pfeiffer, of Lubec; and Simon de Vries, from drawings by Vianen himself; and Frederic William I. king of Prussia, in cameo, with ornamental accompaniments, after J. Goeree, all of folio dimensions.

Vianen also engraved and published several views of his native city of Amsterdam.

Wilhelm, or William Swidde, was born in the province of Holland, A.D. 1660. He probably studied under one of the Visschers. Soon after his pupillage he travelled to Sweden, where he obtained patronage, and where he probably passed the remainder of his life.

He both drew and engraved landscape in a very pleasing style, in which delicacy is united with spirit, and his name and works have the honour of descending to posterity with those of Puffendorf, for the first edition of whose life of Charles Gustavus, of Sweden, Swidde produced the engravings, and also for "*Suecia Antiqua et Hodierna*."

The rest of his prints are generally found in sets, of which there is one, of twelve views of towns and cities in the province of Friesland; another set of six beautiful engravings, entitled "*Verfcheide landschapjes seer aardig getekent door D. Dalens, geetst door W. Swidde, et uitgegeven door N. Visscher*;" and another set of six mountainous landscapes, with ruined edifices, cattle, and figures, in small folio, also after Dalens.

John de Leeuw, the portrait-engraver, is worthy of small notice. He was born at the Hague soon after 1660, and was probably descended from William de Leeuw, of whom we have already treated.

In conjunction with John Lamsveld, he engraved the portraits for "*The History of Louis XIII.*" by Michael le Vaffor. He also engraved the portrait of John, duke of Marlborough, which is inscribed with the motto "*Veni, Vidi, Vici*," in folio; a very neat portrait of Karolus Niellius, in quarto; Joseph Justus Scaliger; and Cowley, the poet.

Robert van Audenaerd, or Oudenord, was born at Ghent, A.D. 1663. The name is provincial, and means literally "*of Oudenord*," of which place the father of our artist is believed to have been a native.

Robert applied himself to the study of art at a very early period of life, under the direction of Van Cleef, and other Flemish masters. He afterwards travelled to Rome for improvement, and was received into the Academy of Carlo Maratti.

At this period he is spoken of with praise as a painter; but we shall here consider him only as an engraver. His early progress in the latter art, was interrupted by an act of professional indiscretion, which is thus related by Strutt.

"He frequently used to amuse himself at his leisure with the point; and being pleased, as it should seem, with a sketch of his master, representing the marriage of the Virgin, he etched a plate from it, of which Carlo Maratti knew nothing, until the impressions being circulated about, he accidentally saw one of them in a print-shop, and by enquiry, soon discovered its author. Audenaerd felt severely the effects of his resentment, which he carried to such an height, that he forbade him to approach his school, declaring he would never see his face again." Maratti, however, though warm in his resentment, was not implacable, and the present writer would willingly ascribe the reconciliation which after-

ward took place between the master and disciple, to the intercession of Giacomo Frey.

Frey (as we have related in our biography of that very distinguished artist), was the liberal friend and fellow student of Audenaerd, and with the energy and indiscretion, possessed the generosity, of genius; every principle of sympathy must, therefore, have operated with him in obtaining the forgiveness of his master, and the return of his friend.

It seems not improbable that the affluity of Audenaerd was quickened by this occurrence, for he soon made so great progress in engraving, that Maratti was extremely pleased, poured forth his inward feelings respecting his art, and they were mellowed into principle, in the presence of his two favourite pupils; and many of his best pictures were, at his own instance, put into the hands of Audenaerd to engrave. In particular, it was by his recommendation, which has since been perceived to have its foundation in the soundest theory, that the two fellow-students learned to incorporate so large a portion of etching as we behold in their historical prints, with the work of the graver.

On this point, Strutt judiciously says, "the plates which were done by this artist entirely with the graver, are not equal, in my opinion, to those where he also used the point; they are cold and destitute of effect, and often, from his great solicitude to avoid an outline, his draperies appear heavy, and want sharpness in the folds. The same heaviness appears also in his heads and other extremities, and all the naked parts of the figure in general, as I think, will readily be allowed on examination of that, which represents "*The Assumption of the Virgin*," from Carlo Maratti, a middling-sized upright plate, with this inscription, "*Quasi aurora confurgens*;" which, if compared with the slight etching of "*Hagar and Ishmael*," from the same master, I think the spirit of the latter will well repay the want of that neatness which is found in the former. Audenaerd certainly possessed great knowledge of the human figure, and his drawing is seldom incorrect."

During his stay in Italy, cardinal Barbarigo, with becoming regard for the fame of his ancestry, engaged our artist to engrave the portraits of the distinguished men of that family, with emblematical accompaniments.

The work consists of one hundred and sixty-five plates, and for some years remained imperfect on account of the death of the cardinal, but at length the five plates which were wanting to its completion, were engraved at the expense of one of his descendants, and the work appeared at Padua, in large folio, accompanied by certain Latin poetry, in the year 1762; since which period it has been sold at the Barbarigo palace, at the price of twelve sequins.

After residing seventeen years in Italy, Audenaerd returned to his native city, where he died in 1743, being fourscore years of age. We subjoin a list of his best engravings.

Portraits.—Cardinal Sacristanti; cardinal Turfus; and cardinal Ottoboni, all from J. B. Gaulli; cardinal Francis Barbarini, after Carlo Maratti; cardinal Henry de la Grange d'Arquien, after Despontes; cardinal Joseph d'Archinto; cardinal Andrea di Santa Croce, both from Joseph Passeri; and father Francis Caraccioli, worshipping the sacrament, after And. Procaccini, all of folio size.

Historical, &c. after Carlo Maratti.—"Hagar in the Desert;" "Abraham offering his Son Isaac;" "Abraham's Servant meeting Rebecca;" "David with Goliath's Head;" "The Celebration of the Victory of David;" "Bathsheba at the Bath;" "The Annunciation;" "The Adoration of the Magi," an etching; "The Flight into Egypt;" "A Repose during the Flight into Egypt," and

in folio; "Christ on the Mount of Olives," in large folio; "Christ on the Cross;" "The Body of Christ on the Knees of his Mother," accompanied by St. John and the holy women; "The Death of the Virgin;" "The Assumption of the Virgin," after a picture in the cathedral of Urbino, all in large folio; "The Death of St. Joseph," an etching in folio; "The Virgin distributing the Rosary to the Nuns," commonly called "Our Lady of the Rosary;" "The penitent Magdalen;" "The Martyrdom of St. Blaize;" "St. Anthony of Padua kissing the Foot of the Infant Saviour;" "St. Philip of Neri;" "James I. king of Italy, received among the Gods;" "The finding of Romulus and Remus," all in large folio; "Daphne purified by Apollo," after a picture in the cabinet of the king of France, on two large plates.

Historical, &c. after various Italian Masters.—"The Nativity of our Saviour," after P. da Cortona, in large folio; a set of five etchings from "The Life of St. Bibienne," the fourth and fifth are from statues by Bernini, the remainder from P. da Cortona; a group of "Atalanta and Hippomenes," after Bernini; "The Rape of the Sabines," from John de Bologna; "St. de Facunda," after Hiac. Brandi, all in folio; "The Birth of the Virgin," from Annib. Carracci; "The Flagellation," and "Supplication of St. Andrew," both in large folio; and "St. Andrew transported to Heaven," in folio, all from Dominichino; "The Holy Family, with St. Luke painting the Portrait of the Virgin Mary," after M. A. Franceschini of Bologna; "The Anger of Achilles," a large engraving on three plates, dedicated to pope Innocent XII., and after J. B. Gauli; and a very rare and large engraving of an allegorical thesis, in which the same pope appears seated on a throne, or in the chair of St. Peter, overcoming heresy, &c.: it alludes also to the conversion of Frederic Augustus, and contains medallions of that prince and queen Christina of Sweden.

Arnold van Westerhout was born at Antwerp in the year 1666. After learning the rudiments of engraving of his father, he journeyed to Italy, and remained for some time at Florence, studying his art under the patronage of the archduke Ferdinand, from whence he removed to Rome, in which metropolis he remained till the year 1730, which was that of his death. His plates are executed with the graver only, in a neat, clear style; but his chiaro-scuro is feeble, and the outlines of his figures are not always correct. He engraved a considerable number of plates from his own compositions, and some few after other masters, among which the following are most worthy of attention.

Portraits.—Michael Angelo Zamburinus, superior of the Jesuits, after Odati; Julius de Arrighettis, superior of the order of the Servites, after Dio. Godin, both in 4to.; cardinal James Antony Moriga, after L. David; and prince Rospoli, in an oval, from the same painter, both in folio.

Hyberical, &c. after various Masters.—"St. Peter No-lasque borne through the Clouds by two Angels," and "Victory," both from his own compositions; a female, with a unicorn, in a landscape back-ground, after Carracci, in 4to.; "The Descent from the Cross," after Daniel de Volterra, in large folio; "The Virgin and Child," after Carlo Maratti; "St. Paul preaching at Athens," after J. B. Lenardi; "The Muses protecting the Monuments of fine Art from the Ravages of Time," all in folio, from the same painter; "The Elevation of Virgine, and Depression of Vice," dedicated to Lazari Pallavicini, in large folio; "A Woman kneeling, crowning an Eagle, accompanied by Pegasus," perhaps the muse of Pindar, after S. David, in folio.

Peter van Gunst was born at Amsterdam in the year 1667. This artist possessed infinitely more patience than good taste. He worked with the graver only, in a style which seems evidently formed upon the works of the Drevels. His first and second courses of lines are equally neat, and equally powerful, which gives them a cold, silvery effect. The folds of his draperies, though not ill drawn, are marked too harshly, especially upon the outlines of the lighter parts of them. His flesh is generally extremely neat, and finished with small dots; but the lights are too much covered, which makes them appear heavy and laboured; and he drew but incorrectly. His portraits are by far the best, as well as the most numerous of his works; but they are, in a great measure, liable to the same objections as his historical subjects. The following are selected from his works, as being of the most importance:

Portraits.—Urbain Cherreau, from John Petitot. This is believed to be the only print engraved after that master, who was a celebrated enamel painter. Cornelius de Witt; Charles de St. Evremont, after Parmentier, all in 4to.; Balthasar Bekker of Amsterdam, author of the Enchanted World, after Webber; Jacob Saporteu, a famous rabbi of Amsterdam; Francis Valentine of Dordrecht, an ecclesiastic, after A. Houbraken; Frederic Dekker, doctor of medicine at Leyden, after C. de Moor, all of folio dimensions; Salomon van Til, theologian, from the same painter, in large folio; Hero Siberina, a clergyman of Amsterdam, from Boissard; John William Triso, prince of Nassau, after B. Vaillant; Boris, prince of Kurakin, minister of the Russian states, after Kneller; Didier Erasmus of Rotterdam, after Holbein; Mary, queen of England, after Vander Werff; Mary Stuart, queen of Scotland; Frederic, palatine, king of Bohemia; Elizabeth, his queen; James I. of Great Britain; Hugh Latimer, bishop of Worcester; Francis Junius, painter and author, all after Vander Werff; head of William III. of England, after J. Brandon, all of folio size; Charles II. of England, after F. Stampart, in large folio; John Churchill, duke of Marlborough, after Vander Werff; a set of ten portraits, of Charles I., his queen, and the English nobility of both sexes of his court, whole length figures from Vandyke; and a set of nine, of "the Loves of the Gods," after Titian, all in large folio. The same set was engraved in mezzotinto by J. Smith.

Bonaventura Overbeck, surnamed *Romulus*, was born at Amsterdam in the year 1667, and died in the same city in 1706. He was the disciple of G. Laiffe, and published three folio volumes, (entitled "Reliquie antique Urbis Romae," of the antiquities of Rome; to which city he travelled three times, to make the necessary studies from nature, after which his plates were etched; and hence he obtained the cognomen of Romulus. His engravings are much admired for their firmness of style, and judicious distribution of light and shade, and were published at Rome in the year 1709; but presumptively there was an earlier edition.

Isaac Moucheron was likewise a native of Amsterdam, and born in the year 1670. He was the son of Frederic Moucheron, an admirable landscape painter, of whom he learned the rudimental principles of art; but at the age of twenty-four, travelled to Rome for improvement, where he made a great many drawings of Tivoli, and other places in and about Rome. After his return to Amsterdam, he soon became known by his excellent landscapes, enriched with figures and animals, which are held in the highest estimation. This artist executed a considerable number of etchings, in a very delicate style; the most important of which are a set of twenty-six folio plates, entitled "Views or

Heemsted,

Heemsted, in the Province of Utrecht, drawn and engraved by J. Moucheron, and published by the Widow of Nicholas Visscher, with the Permission of the States General." They are accompanied with French and German letter-prefs. Four garden views, with ruins and figures in the antique style; another set of four, of the same character, in large folio, from his own drawings; four landscapes, with buildings and figures, entitled "Einigé Landscapen, geschildert door G. Poussin in Rome, in t'Koper gebracht door J. Moucheron in Amsterdam," in folio; and a landscape, mentioned by Bassan, of which we know neither the title nor description.

Matthew Pool was born at Amsterdam in the year 1670, but studied engraving at Paris, where he resided for some years. He afterwards returned to his native country, where he married the daughter of Barent Graat, and engraved a considerable number of plates after various masters, in a style resembling that of Bernard Picart. The most important of his engravings are as follows: Petrus Hogenbetius, physician and poet; Barent Graat, the father-in-law of our artist; "Jupiter suckled by the Goat Amalthea," after B. Graat, all in folio; "Cupid caught in a Net by Time," after Guerchino, in an oval; a bacchanalian subject, after Poussin; a set of twelve, after Rembrandt, all in 4to; a set of one hundred and three, entitled "The Cabinet of the Art of Sculpture, by Van Bossuet, engraven by M. Pool, from the Drawings of B. Graat," in folio; and the three large burlesque representations of the ceremonies practised by the Dutch painters at Rome, on the reception of a member into the society, called "Schilderbent," from drawings by Barent Graat, after the original pictures by Dominique van Wynen, all in large folio.

James Coelmans was born at Antwerp in the year 1670, and died at Aix, in Provence, in 1735. He was the disciple of Cornelius Vermeulen, and was invited to Aix by M. de Boyer d'Aguilles, to engrave his collection of pictures, in conjunction with Sebastien Barras. This set of engravings was finished A.D. 1709, but was not published till 1744. It is the most considerable, and the best of the works of Coelmans, though the plates are executed chiefly with the graver, in a dark heavy style, destitute of harmony.

The drawing of the naked parts of the human figure is defective, and the expression of the heads is likewise but poor. The set of engravings above mentioned, consist of one hundred and eighteen, from which the following are selected as being the most important.

Portraits.—Donna Olympia Maldachini; the niece of pope Innocent X. from a picture by Josephin; the mistress of Alexander Varotari, surnamed Veronese, from a picture by that painter, both in quarto; a head of Paul Veronese, painted by himself, in folio; Conradus Ruten, from Bronckhorst, in quarto; Francis de Malherbe, after Finsonius Belga; Vincent Boyer, comte d'Aguilles, &c. from a picture by le Grand; and John Batista Boyer, comte d'Aguilles, &c. after Hyacinthus Rigaud, all of folio dimensions.

Historical, &c.—"The Holy Family," with a landscape back-ground, from F. Massoli Parmensis, in large folio; "St. Dominique passing the Holy Writings through the Fire, without damaging them," after Fr. Vanni; "The first Interview of Rachael and Jacob," after Michael Angelo; and its companion "Laban recompensing Jacob with Rachael," from the same painter; "Jacob quitting Laban," a fine composition, after Castiglione; a very rich composition of musicians, dancers, drinkers, &c. surrounded with whatever can add to the luxury and support of mankind, inscribed "Omnia vanitas," from the same painter; "Diana

and Actæon," from Ottovanius, all of large folio size: "Lot and his Daughters flying from Sodom," after Rubens, in folio; the interior of a Gothic church, with figures, after Steenwyck, in quarto; "A Satyr drinking from a Vase, which is supported by a Cupid," accompanied by a nymph, who seems to say, that is enough! and is probably intended for Temperance, after Poussin; "The Martyrdom of St. Bartholomew," after Seb. Bourdon; "Mount Parnassus," a rich composition, from Eustace le Sueur, all in large folio; "The Flight into Egypt," after P. Puget; "The Murder of the Innocents," from Claude Spierre, both in folio; and a head of "The Holy Virgin," after Seb. Barras, in large quarto.

Albert Haelwegh was a native of the Netherlands, and born about the year 1670. In 1690, he resided at Copenhagen; but was afterwards invited to Denmark, where he engraved a considerable number of portraits, in a stiff, dark style, but which, for some reason with which we are not acquainted, are collected with some degree of avidity by the foreign connoisseurs. Of the works of Haelwegh, the following are most worthy of notice; Louis, landgrave of Hesse Cassel, from S. Duarte; Joachim de Gerdford, of Synbyholm; Otten Krag de Woldberg; Gundec Rosenkrantz de Winding; Frederick Ratz de Tygestrup; Peter de Reetz de Tygestrup; and Magnus Kaas de Stofring, all Danish senators, from Albert Wachters, in folio; Sophia Amelia, queen of Denmark and Norway, in large folio; Christian, count de Rantzou, earl of Brandenburg, a fine portrait, in large folio, both from the same painter; the frontispiece to the "Flora Danica" of Simonis Pauli, with a portrait of the author, after Carl van Mander, in quarto; and "The Four Seasons," from the same painter, also in quarto.

Francis Piffen was born at Ghent in the year 1676, and became the pupil of Robert van Audenaerd. There are very few prints by the hand of this artist, and the following are all we can specify. "The Holy Virgin suckling the Infant Christ," after Rubens, in octavo; "The Conversion of St. Bavon," a grand composition, arched at the top, after Rubens, in large folio; "The Judgment of Midas," after the same painter; and "The Martyrdom of St. Blaize," from Gaspar de Crayer, both in folio.

Abraham Rademacker was born at Amsterdam, A.D. 1675, and died at Haerlem in 1735. He became an excellent landscape painter and engraver, without any instructions, having never studied under any master.

Rademacker drew in Indian ink, and painted in distemper, many views in Holland, which he embellished with figures and animals; he also etched a collection of views in the United Provinces, in a very masterly style; it contains three hundred prints, and was published at Amsterdam in 1731, in two quarto volumes.

Francis Harrewin was born at Brussels in the year 1681. He was the disciple of Romyn le Hooghe, and engraved a considerable number of plates from his own compositions, and those of other masters. Among his works is a set of the castles and villas, for le Roy's account of the Brabant family, which was published in 1699; and also the following portraits of Henry de Lorraine, duke of Guise; Marguerite de Valois, both in octavo; Albert, archduke of Austria, a whole length figure at prayer with St. James; its companion Isabella, infanta of Spain, also kneeling, while St. Margaret is presenting her with a wreath of flowers, both very rare prints in large folio, and after Rubens. Two folio views of the house of sir P. P. Rubens, at Antwerp, after Van Croes, may also be reckoned among the best productions of Harrewin.

Francis de Wilde was a native of Holland, born some time about the year 1680; according to Huber, but probably at a somewhat earlier period, since the etchings of his daughter were published in 1703. He resided at Amsterdam, where he etched and published "The Angels appearing to Abraham;" "The Birth," or "Triumph of Venus;" views, of a sea-port, and the city of Chalons, a landscape with reapers, and some few other subjects, both historical and landscape, which are believed to be all from his own compositions. His etchings are performed in a pleasing and spirited style, and the above were published early in the eighteenth century.

D. Wilde also acquired some celebrity by his collection of antique gems, which were etched by his daughter Mary, on fifty quarto plates, and published at Amsterdam, in the year which is mentioned above.

John Admiral, or P'Admiral, was born at Leyden, A.D. 1680. Under whom he studied is not known, but his ingenuity was very considerable, and he employed much of his time in engraving natural history and anatomy. The anatomical plates which he engraved for the work of the celebrated Ruysch are held in great estimation, and his other most important work is engraved from his own cabinet of insects, to collect and arrange which occupied thirty years of his life, excepting that portion of his time which was necessarily spent in his professional pursuits as an engraver. This collection was engraved on twenty-four plates, and published by P'Admiral himself in 1746.

A. van der Laan was born at Utrecht in the year 1690. He travelled to France, and remained there some years, during which time he was chiefly employed by the Parisian bookellers.

The most considerable work we have by this artist, is a set of landscapes, many of which are of the heroic and classical subjects which were painted and drawn in Germany and Italy, by Polydore. They are etched in a very delicate style, but on closer examination they appear to want precision.

This artist also engraved a good number of plates after Van der Meulen, among which are the frontispiece for Ryer's Alcoran, in quarto; the portraits of Lawrence Coster of Haerlem, in folio; a burlesque hunt of dwarfs, in large folio; and two large folio plates of "The Whale Fishery."

Peter Bout was a native of Brussels, and was born in the year 1690. He painted conversational subjects, and always introduced the figures in the landscapes of Bodewyns. There are some slight etchings by the hand of this artist, from his own compositions; among which the following are the most important. A set of four landscapes, two of which are winter scenes with skaters, the third a post chaise stopping at the door of an inn, and the fourth is a marine subject, in folio.

A. F. Bargas was the countryman and contemporary of Bout. He executed some few etchings of landscapes in a free and spirited style, both from his own compositions and those of P. Bout; which he usually marked with the letters A. F. combined in a cypher, and placed before his name. Among these are a set of six views of towns, villages, &c. embellished with figures from his own designs; and a set of four after P. Bout, viz. "A Fish Market;" "The Bride conducted to Church;" "A Country Wedding;" and "A Village Fair," all of folio dimensions. This last set was published, both with and without the names of the artists.

John Wandelaar, or Wandelaar, was born at Amsterdam in the year 1692. He studied the principles of drawing and engraving under Folkema and William van Gauwen;

and was so much interested in the general prosperity of the fine arts of his native country, that he became one of the most distinguished and strenuous advocates in Amsterdam for the erection of a public drawing academy in that city.

Wandelaar paid great attention to the study of anatomy, and was acquainted with the three greatest anatomical professors of the age, namely Ruysch, Kant, and Albinus, for the great work of the latter of whom he engraved the large anatomical figures, so much and so justly admired. They were drawn from the subjects themselves by Wandelaar under the inspection of Albinus, who appears to have directed him, though, copying from dead and flayed subjects, to swell out the muscles to the natural plumpness of living and strong men. The plates are engraved in a clear style, well adapted to the occasion, and were first published in the year 1747. The work appeared under the title of "*Tabulae selectae et musculorum corporis humani*," and was soon translated into English, and the plates copied by Grignon, Ravenet, Scotin, and others. Wandelaar likewise painted portraits on pasteboard; and drew with great ability in red and black chalks, frequently copying the pictures of the old masters. The following engravings also are by him. A set of twelve quarto plates, of "The Birth, Life, and Death of Our Saviour;" the portrait of Herman Boerhaave, professor of medicine at the Leyden academy, in folio; and two octavo plates of "The Grand Emir and his Wife; or King and Queen of the wandering Arabs."

Jacob Folkema was born at Deekum, in Friesland, in the year 1692, and established himself at Amsterdam, where he died A.D. 1767. He studied engraving under his father, and produced a great number of plates, of which some are after Picart, and others from his own compositions. They consist chiefly in small portraits, and vignettes for books. This artist had a sister Anne, who painted miniatures with some success; and likewise made some few etchings.

The most esteemed of the engravings of Folkema are, an emblematical subject on the death of the prince of Orange, William IV.; "Time unveiling a Bull of Francis Rabelais," surrounded with allegorical figures, in quarto, an odd composition. A lion and dog sleeping; and its companion, a lion and cat sleeping, in folio. The portraits of Michael Cervantes de Saavedra, from G. Kort; John Ens, professor of theology at Utrecht, after Colla; Petrus de Mastrecht, professor of theology at Frankfurt, from the same painter; Humphry Prideaux, dean of Norwich, after E. Seeman jun. all in quarto; Snetlagius, an ecclesiastic of Amsterdam, from Anne Folkema, in folio; and "The Martyrdom of St. Peter and St. Paul," in large folio, after Nicolo del Abbate, for the Dresden collection.

Jacob de Wit was born at Amsterdam in the year 1695, and died in the same city in 1754. He was successively the disciple of Albert Spire, a portrait painter, and Jacob van Halen, an historical painter, but he greatly conduced to his own improvement, by studying the pictures of Vandike and Rubens. De Wit painted history, and excelled in painting in imitation of bronze and marble basso-relievo. In the year 1712, which must have been while he was yet a youth of seventeen, he made drawings from the ceilings in the Jesuits' church at Antwerp, by Rubens, some of which he engraved, or assisted Punt in engraving. He likewise etched a few other plates in a free intelligent style, among which are "The Holy Virgin and Infant Saviour," in small quarto; and a set of four of groups of cupids and geni, variously engaged, in large quarto; the latter set are probably his very best productions in this art.

John Punt was born at Amsterdam in the year 1711. He studied engraving under Van der Laan, and the art of painting

ing in imitation of basso relievo, under Jacob de Wit. He also painted history in a style which bears strong resemblance to that of Terveltin, and after the age of fifty-five executed several ceilings; but we have here to treat of him only as an engraver.

In his folio prints from the compartments of the ceilings of the Jesuits' college at Antwerp, Punt discovers admirable taste and skill. Perhaps in the works of no engraver whatever, may be seen better examples of the bold fore-shortening of Rubens, whose knowledge of the perspective of objects, when seen from beneath, and especially that of the human figure, is admirably displayed in these ceilings, and is not less admirably rendered in the engravings, through the medium however of drawings, which we have already mentioned, and which must in all probability have been excellent, by J. de Wit.

Punt is one of those artists whose general reputation in the world has been by no means in proportion to their merits. Strutt, as the present writer conceives, could not have seen his productions, or could only have seen those few plates which, though they bear his name, are evidently the work of some inferior artist, for he calls him, with a tone of acquiescence in the deficiency of his fame, "a Dutch engraver of no great note;" and Huber and Martini have fallen into another error respecting him, (as will be noticed below,) which has also tended to deprive him of some portion of his just meed of reputation.

Regarding his "Moses on the Summit of Pisgah;" his "Queen of Sheba in the Presence of Solomon;" his "Nativity of Christ," or any other of the best of this series of engravings from the ceiling of the Jesuits' college, we scarcely know where to look for an historical engraver who accomplished more successfully, what he evidently aimed at; or who has imparted to his works more of the appearance of finish with the reality of slightness. Other men may proceed in the production of more operose works by careful observation and patient industry; a well-practised hand, guided by the vivid and spontaneous feeling of a tasteful mind, is alone adequate to the production of such prints as these. The art of leaving broad masses of white paper, without the least appearance of baldness, crudeness, or chalkiness, Punt possessed in an exemplary degree; and notwithstanding his slightness, his tones, when required to be so, are sweet, hazy, and aerial, in the upper parts, and it should be remembered that, in these celebrated ceilings, the perspective points, of sight and distance, are not in the horizon but in the heavens, while, in the lower part, his engraving is rich, mellow, and vigorous. In "The Adoration of the Magi," and "St. Michael expelling the rebellious Angels," these qualities are more especially observable. In the latter the rolling clouds, and smouldering smoke, and bickering flame, as well as the nudities, wings, shield, and drapery of the figures, are treated in a very superior style. His metal vases, armour, and other such objects, have also, though done with small labour, a peculiarly polished and glittering character, and all the various objects that enter into these several compositions are harmonized with artful simplicity, and in each are so thoroughly incorporated, that all evidently appears to be the production of the same hand and mind; and that mind, at no time languid; but always animated, rapid, in full possession of itself, and carrying the spectator of taste along with it.

The chiaroscuro of Punt is broad, bold, and harmonious; his lights are bright; his shadows and reflexes cleared and enriched by vigorous touches of the graver, and his most delicate tints are firm. His style of manual execution, generally speaking, consists of masterly courses of lines firmly

etched, or freely engraven: so freely, that the dextrous incorporation of these two modes of art are in his works much to be praised. Sometimes he throws a second, and sometimes a third course of engraved lines across his etching with the utmost freedom, as may be seen in the draperies, clouds, ground, and other passages of his works; and upon other occasions, as in metallic and other shining or polished substances, he employs an interline, always adapting his hatching, so as to characterize, in proportion to their relative degrees of importance in the composition, the several textures of the surfaces to be expressed.

Huber and Martini state that of the set of engravings from the compartments of the ceiling of the collegiate church of the Jesuits, ten were etched by Jacob de Wit, namely, "The Fall of the rebel Angels;" "The Ascension of Elias;" "Elihu before Ahazuerus;" "The Nativity;" "The Triumph of St. Joseph;" "The Temptation;" "Resurrection," and "Ascension of Christ," and "The Assumption" and "Coronation of the Holy Virgin."

Now, these ten engravings exhibit two such distinct and almost opposite styles of etching, that they cannot all be the production of the same artist. It is further observable, that the whole set of thirty-six bear the name of D. Wit as the draughtsman who, in the first instance, made those copies from the ceilings of Rubens, from which the plates were engraven,—one only of those ten mentioned by Huber and Martini bears the addition of "aquaforti" to the words "J. de Wit delineavit," and that one is "The Temptation of Christ in the Desert," which is etched in a style very inferior to "The Fall of the rebel Angels," and those other subjects which are enumerated above; another, which is inscribed "De Wit aquaforti," is "Abraham offering up Isaac," which is not mentioned by those authors as being the production of his etching-needle. On the whole, we are therefore led to claim all the most meritorious of these engravings for John Punt, and to conclude that Huber and Martini must, in this instance at least, have written at random.

The works of this artist, with which we are acquainted, are the portraits of Joanna Koerten Block, as a medalion with attendant genius, and Jacques de Roure of Antwerp, from a picture by himself, both in quarto. A set of forty small folio plates, of which the subjects are taken from La Fontaine's fables, after the designs of d'Oudry, published in 1758 and 1759; a set of thirty-six folio plates from Rubens' ceilings of the collegiate church of the Jesuits at Antwerp, prefaced by an historical portrait of this great painter, with allegorical accompaniments designed by De Wit. "The Ascension of Our Saviour," engraved after Sebastian Rica, for the work which is entitled "The Dresden Gallery;" "The English Coach," after G. van der Myn, both in large folio; "The Guard-House of the Dutch Officers," after C. Troost; engraved for the cabinet of M. Braamcamp at Amsterdam, by Punt and Tanje, and, by the same engravers in conjunction, "The Declaration of Love," and "The Proposal of Marriage," both after Troost, and of folio dimensions.

John Louis Krafft was born at Brussels, A. D. 1710. In 1733, he published a book, intitled "Tresor de Fables choisies des plus excellens Mythologistes," containing one hundred and fifty of his engravings. And afterwards the portraits for the history of the house of Austria, which was published in three folio volumes at Brussels, in 1744. This artist likewise etched five subjects after Rubens, which are specified in the catalogue of the works of that master, all of which are very rare; and also, "Job surrounded by his Friends and his Wife;" "Christ giving the Keys to St. Peter;"

LOW COUNTRIES, ENGRAVERS OF THE.

Peter;" "Christ with Nicodemus," (half figures,) all from Rubens; "Jupiter and Danae," from a drawing by Rubens, after Titian, all in 4to.; "Venus and Cupid," from a drawing by Rubens, after Giorgione; "St. Martin dividing his Cloak with the Beggar," after Vandyke, in large folio; "The Village Goatherd," and "Country Conversation," both in folio; and a stormy sea view, in large folio, all from Teniers.

Krafft heightened some of the impressions from his engravings with white chalk, which, from the difficulty of preserving such works, are now become rare and valuable.

Cornelius Troost was born at Amsterdam in the year 1697, and died in the same city in 1750. He was the pupil of Arnold Boonen, and besides engraving both in lines and mezzotinto, he painted portraits, fancy subjects, and history, and was furnished the Watteau of Holland, from the sparkling delicacy of his touch, and purity, and beauty of his colouring. The etchings of this master are much sought after for their truth and brilliancy; he likewise scraped several subjects in mezzotinto, among which are, a bull of an old man with a long beard, and a girl drawing, both in 4to; the portrait of Pietro Locatelli da Bergamo, and that of Vlaming, the poet, with two Dutch verses beneath, both in large folio, and all from his own drawings and paintings.

Philip Endlick, or Endelick, was born at Amsterdam A. D. 1700. He was the disciple of Bernard Picart, and always resided in the place of his nativity. The following portraits are engraven by him, from his own drawings, and are executed in a firm style. John Taylor, the celebrated oculist, of London; Henry, count of Moens; John Philip d'Almérie, governor of the isle of St. Martin; John Gosewyn Eberhard Allien, John Noordbeck, Peter Hollebeck, and Leonard Beels, all clergymen of Amsterdam, of folio size.

Peter Tanjé was a native of Amsterdam. He was born in the year 1700, and died in the same city in 1760. Tanjé was a laborious artist, and engraved a great number of portraits, vignettes, &c. But his most considerable work is five plates, from the famous windows of St. John's church at Gouda, and he likewise worked for the Dresden gallery. The following are selected from his engravings, as being most worthy the attention of the connoisseur.

Portraits.—Peter Tanjé, from J. M. Quickhard; John Maria Quickhard, both in folio; Martin Luther, from Lucas Cranach, in 4to.; Benjamin de Brissac, an ecclesiastic of Amsterdam, from L. F. du Bourg; Charles Linnæus, professor of botany at Upsal; John Osterdyck Scheit, doctor of medicine at the Utrecht academy, after Quickhard; Albert Vogt, theologian; John Beukelman de Honn, an ecclesiastic, from P. M. Brasser; John van Marle, an ecclesiastic of Rotterdam, after Curland; Thomas Philip de Boffu, cardinal and archbishop of Mechlin, from Snyers, all in folio; Lawrence Heister, surgeon; and Henry Ulhorn, physician; two medallions on the same plate, from Quickhard in 4to.; William van Haren, regent of Friesland, from Akema, in an oval; William, prince of Orange, from F. de la Croix; George II. of England, from Faber; Charles VII. of Germany; Christina, queen of Sweden, from Seb. Bourdon; Gustavus Reinbeck, doctor of theology, from Pefne; and M. Fagel, after G. J. Xavery, all in folio.

For the Gallery of Dresden.—A man with a book, from Correggio, known by the name of "The Physician of Correggio," in large folio; a woman in a bonnet, after Rubens, in folio; "A dead Christ," from F. Salviati; "Children

dancing before the Altar of Love," from Albano, both in large folio; "Card Players," after Michael Angelo, "Tarquin and Lucretia," from Lucas Jordens, both in folio; "Joseph and the Wife of Potiphar," half figures, from Carlo Cignani; and a portrait of a man, after Rembrandt, half length, both of folio size.

Historical, &c.—"The Temptation of Job," after Troost, in 4to.; "The Court of Law, of the Peasants of Puterveen," for the cabinet of M. Ploos van Amstel; and in companion, "The wicked Tavern-keeper at Puterveen;" "False Virtue or sham Sorrow;" and its companion, "The Tutor deceived," all in folio; "The Philosophers, or the runaway Girl;" "The sick Chamber of the Dutch;" and "The Marriage of Chloris and Roletta," all in large folio, after Troost.

Peter van Bleeck the younger was born in the year 1703, somewhere in Flanders, but for the greater part of his life resided in England, and died in London A. D. 1764. He was a mezzotinto scraper, and the son of Richard van Bleeck, a portrait painter; he always added the word junior to his name or cypher, for which see Plate IV. of those used by the artists of the Netherlands.

Most of his works are portraits, and are executed in a style not inferior to that of John Smith. The following are some of the most important. Richard van Bleeck, from a picture by himself; Francesco du Quefnoy, from A. Vandyke; Paul Rembrandt van Ryn, from a picture by himself; Eleanor Gwin, from Sir Peter Lely; Mrs. Cibber in the character of Cordelia; Mrs. Clive, in the character of Phillida; the comedians, Griffin and Johnson, in the characters of Tribulation and Ananias, all from his own drawings; and "The Virgin with the Infant Saviour," after Vander Werff. The four last are in large folio, the rest somewhat smaller.

Arthus Schouman was born at Dordrecht in the year 1710, and studied the principles of art under Adrian van der Burg. He became a painter of some repute, and in 1748, he established himself at the Hague, where he continued to exercise his various talents in crayon and water colour, painting; etching; mezzotinto scraping; and engraving on crystal, till toward the close of the century.

Among his best prints are a small etching of St. Francis; a man's head with moustachios, in 4to; and a lady at her toilette, in 4to.; Saartze Jans, after Troost, with six Dutch verses; a mezzotinto engraving in folio, and a party of amateurs at the house of a painter, also after Troost, and of 4to. size.

Simon Fokke was born A. D. 1712 at Amsterdam, and studied engraving under John Caspar Philips. He was a man of patient industry and unremitting application, but of little taste, and no genius. The greater part of his works consists of small portraits and vignettes, which he executed for the Dutch booksellers with considerable neatness. In the large historical works which he attempted he was far less successful.

Among his best productions are the portraits for a work, intitled "Portraits historiques des Hommes illustres du Danemarck;" it was published in 1746, in 4to.; and also the prints for another work, intitled "Arrivement et Séjour de L. A. S. S. et R. Monseigneur le Prince Stadholder Héritaire des Pays Bas, et de Madame son épouse, à Amsterdam le 30 de Mai et jours suivans, en 1768." Of his single prints upon a larger scale, the following are to be preferred. A portrait of himself, in 4to.; a view of the Y before Amsterdam, in folio; "The Statue of the Prince of Nassau Weibourg," from Haag; "Jacob keeping the Sheep of Laban," from the Dresden gallery, after Elspagnoletto; "Women

"Women bathing," after Troost; a burlesque on the death of Dido, in the Dutch style, after the same painter; a landscape, with the effect of winter, after P. Breughel; a view of the port of Livourne, after Vernet; and its companion, a view in the neighbourhood of Narni in Lombardy, from the same painter, all in folio.

Jurian Cootwick, or Kootwyck, was originally a goldsmith, and born at Amsterdam in the year 1714. He excelled in drawing with Indian ink and crayons, and engraved after many of the old masters, with some ability. An old woman seated, with a paper in her hand, in imitation of a drawing in black and white chalks; another of the same subject, a man seated, with his hat on his knees; a shepherd playing the flute, accompanied by a shepherdess; a landscape; the same landscape with alterations; a pair of landscapes; a pair of rustic subjects, with cows; and a loaded ass, are all believed to be after his own drawings.

He also engraved a sea view, after Lud. Backhuysen, which is very rare; a very highly finished engraving of the same subject; a pastoral subject, with a shepherd and his flock, after Berghem; and a set of three of cows and an ass, after P. van Bloemen.

Jacob vander Schley was likewise a native of Amsterdam, and born in the year 1715. He was one of the best of the pupils of Bernard Picart, under whom he studied till the death of that artist, and afterward finished most of the plates which were left imperfect by him.

The greatest part of the engravings of Schley are vignettes, portraits, and other book ornaments, which he executed in the style of his master: the following are some of the best of them.

"An Emblem of Divine Justice," John Baptista Boyer, marquis d'Argens, from Th. van Pee; Antonio Bernard Prévot, almoner to the prince of Conti, both in 4to; Bernard Picart, surrounded with allegorical figures, designed by Schley himself in folio; Henry de la Tour, viscount Turenne; and "The Combat between Jarnac and Chataugneraye," both small plates, and from drawings by the engraver himself.

Peter Spruyt was born at Antwerp in the year 1720. He was a man of some talent, and etched several plates, among which are the following, all after Rubens.

"Susannah surprised by the Elders;" "The Rape of Orythia;" "The Continence of Scipio;" and a group of children with wreaths of flowers, all of folio size.

C. Exthau was a native of Holland, whom Brandes mistakenly supposes to have been an Englishman. He was born in the year 1730, and became one of the most successful of the numerous imitators of Rembrandt, after whose pictures and prints he chiefly engraved.

Among his best works are, the head of an old man with a beard and large round hat, executed by means of mezzotinto combined with etching; head of an old man with a beard and short hair, both small; "Joseph accused by the Wife of Potiphar," a large folio print, with a striking chiaroscuro; "The Storm and Ship," wherein are the apostles, also distinguished by its very grand effect. After Rembrandt: a girl with a basket of cherries, accompanied by two boys, is after Rubens.

Christina Chalou was born at Amsterdam in the year 1747. She was distinguished, from a very early period of life, by her talent and love for the fine arts, and was instructed in that of engraving by Van Amstel, and Sarah Troost. The final period of her life has not been recorded, and she may perhaps be still living.

Christina is believed to be of the same family with the

two distinguished painters of the same name, who are now practising their art with so much credit to themselves, and benefit to the public, in this metropolis. There are prints from her hand which were produced at the very early age of ten years; in particular one, containing three figures, a promising and honest earnest of her future attainments. She engraved both in lines and in imitation of crayons. In the latter mode of art, her print of a seclusion in conversation with two children, is stippled with sufficient neatness. Among her best works in lines are two pair of heads in small circles; "The Entrance to School;" "The Interior of a Village School," and some other plates, of which the subjects are various incidents of domestic conversation, and Dutch rusticity.

We are now arrived at the time which gave birth to an engraver of the Low Countries, who is still living, following his professional pursuits in England, and known to the present writer. Ever regardful of the public, he stops short with a distrust of his own feelings, which may not be thought unbefitting, at the name of Mr. Anthony Cardon.

LOWE, PETER, in *Biography*, a surgeon of the sixteenth century, was born in Scotland. In a work, entitled "A Discourse on the whole Art of Chirurgery," published at Glasgow in 1612, he acquaints his readers, that he had practised twenty-two years in France and Flanders; that he had been two years surgeon-major to the Spanish regiment at Paris; and had then followed his master, the king of France (Henry IV.) six years in his wars. In the title page of his book, he calls himself doctor in the faculty of surgery at Paris, and ordinary surgeon to the king of France and Navarre. It does not appear how long he had resided at Glasgow; but he mentions that, fourteen years before the publication of his book, he had complained of the ignorant persons who intruded into the practice of surgery, and that in consequence the king (of Scotland) granted him a privilege, under his privy seal, of examining all practitioners in surgery in the western parts of Scotland. He refers to a former work of his own, entitled "The Poor Man's Guide," and speaks of an intended publication concerning the diseases of women. His epitaph in the cathedral church of Glasgow (see Penning's Tour to the H. L. p. 124.) is, however, dated 1612, in December of which year the work just mentioned was published; so that it is probably prevented by death from publishing his next work. "The Discourse on Chirurgery" appears to have been in a 2d. ed.; for the fourth edition of it was printed in London in 1754. It is, indeed, copious, plain, and adorned with all the references to ancient and modern authors; and, in fact, like the majority of books of that time, is more founded on authority than observation. James mentions another work of his with the following title, "An easy, certain, and perfect Method to cure and prevent the Spanish sickness; by Peter Lowe, doctor

doctor in the Faculty of Chirurgie at Paris, Chirurgion to Henry IV." London 1596, 4to. Aikm's Biog. Mem. of Med.

LÖWEN. in *Geography*, a royal town of Silesia, in the county of Glatz, the inhabitants of which are chiefly employed in turning; 13 miles W. of Glatz. N. lat. $50^{\circ} 13'$. E. long. $16^{\circ} 3'$.

LÖWEN, Löwen, or Lewin, a town of Silesia, in the principality of Brieg, on the Neisse; nine miles S.E. of Brieg. N. lat. $50^{\circ} 40'$. E. long. $17^{\circ} 23'$.

LÖWENBERG, or LEMBERG, a town of Silesia, in the principality of Jauer, near the Bober; 25 miles W. of Jauer. N. lat. $51^{\circ} 5'$. E. long. $15^{\circ} 42'$.

LOWENDAHL, ULRIC-FRIDERIC, WOLDEMAR, Count *cf.* in *Biography*, a celebrated general, was born at Ham-burgh in the year 1700. His father, grand marshal and minister of the king of Poland, elector of Saxony, injured him to arms when he was only thirteen years old. He rose gradually in the army, and served in several campaigns, exposed to the dangers and fatigues of warfare, proving himself, on all occasions, worthy of the rank he held, by his valour and prudence. In 1721 the king of Poland gave him the command of his horse-guards and a regiment of infantry; his leisure time he employed in the profound study of gunnery and fortification, and in 1728 he was made field-marshal and inspector-general of the Saxon infantry. After the death of the king he distinguished himself in the defence of Cracow; in the following campaigns he commanded the Saxon auxiliaries on the Rhine under prince Eugene, and he had a chief command at the storming of Otchakof. In 1743 he entered the service of the king of France, and was for some years actively employed in the war in which that monarch was engaged. In 1747 he attained the summit of his glory as a besieging general, by making a sweep of several towns of Flanders, concluding with that of Bergen-op-Zoom, which had been deemed impregnable. Immediately after the capture of this last place Lowendahl was declared a marshal of France. He now retired from the active scenes of war, and distinguished himself as a worthy estimable character in private life, equally agreeable and instructive in conversation, and furnished with a variety of knowledge. He was conversant with many languages, and devoted a large portion of his time to reading. He died at the age of fifty-five. His name had been some time enrolled among the honorary members of the Academy of Sciences. Moreri.

LOWENDOLLAR, or LAONDOLLAR, a Dutch silver coin, valued at 42 silvers, or a little more. This coin is $\frac{1}{3}$ of the ducatoon, weighs 17 dwts. 14 grs., and is valued at 43.07d. in Sir I. Newton's Table of Assays, &c.

LÖWENSTEIN, in *Geography*, a town and capital of a county, which is a fief annexed to Wurtemberg; nine miles E.S.E. of Heilbronn. N. lat. $49^{\circ} 6'$. E. long. $9^{\circ} 28'$.

LOWER, RICHARD, in *Biography*, an eminent physician and anatomist, was born at Tremere, in Cornwall, about the year 1631. He was descended from a good family, and received a liberal education, being admitted as king's scholar at Westminster school, and thence elected to Christ-church college, in Oxford, in 1649. After the usual course of university studies, he took the degree of M.A. in 1655, and then turned his attention to medicine. He became acquainted with the celebrated Dr. Willis, who employed him as a coadjutor in his dissections, and found him so able an assistant, that he afterwards became his steady friend and patron, and introduced him into practice. In 1665, Lower took the degree of M.D.; and in the same year published a defence of Dr. Willis's work on fevers,

entitled "*Diatribæ Thomæ Willisii M.D. et Prof. Oxon. de Febribus Vindicatio adversus Edm. de Meara Ormondien-sen Hibern. M.D.*" 8vo., a work of considerable learning and force of argument, but not without some fallacies, as he afterwards himself admitted. But his most important work was, his "*Tractatus de Corde, item de motu et calore Sanguinis, et Chyli in eum transitu*," which was first printed in London in 1669. In this work the structure of the heart, the origin and course of its fibres, and the nature of its action, were pointed out with much accuracy and ingenuity. He likewise demonstrated the dependance of its motions upon the nervous influence, referred the red colour of the arterial blood to the action of the air upon it in the lungs, and calculated the force of the circulation, and the quantity and velocity of the blood passing through it. In a word, this treatise was one of the most important contributions of the time to anatomical and physiological improvement. The work excited particular notice, in consequence of the chapter on the transfusion of blood from the vessels of one living animal to those of another, which the author had first performed experimentally at Oxford, in February 1665, of which some account had been laid before the Royal Society, and printed in the Philos. Transactions 1666, through the request of the Hon. Robert Boyle. He subsequently practised the transfusion upon an insane person before the Royal Society. Lower claims the merit of originality in this matter; but the experiment had certainly been suggested long before by *Liberius* (which see), and it is a matter of dispute with whom the thought first originated. It is allowed, however, that the French first tried the experiment upon the human subject. But it were useless to enter into the question; since experience soon decided, that the operation was attended with pernicious consequences, and it was therefore exploded. Lower had removed to London soon after the commencement of these experiments, and in 1667 had been a fellow of the Royal Society, and of the College of Physicians. The reputation acquired by his publications brought him into extensive practice; and after the death of Dr. Willis, he was considered as one of the ablest physicians in London. But his attachment to the Whig party, at the time of the Popish plot, brought him into discredit at court, so that his practice declined considerably before his death, which occurred in January 1690-91. He was buried at St. Tudy, near his native place, in Cornwall, where he had purchased an estate. In addition to the writings above-mentioned, he communicated some papers containing accounts of anatomical experiments to the Royal Society; a small tract on catarrh, which was added, as a new chapter, to the edition of the treatise de Corde of 1680; and a Letter on the state of medicine in England. Gen. Biog. Eloy Diet. Hist. de la Med.

Lower, To, in *Sea Language*, is to ease down gradually, expelled of some weighty body, which is suspended by tackles or other ropes, which being slackened, suffer the body to descend as slowly or expeditiously as the occasion requires. Hence lower *handily*, and lower *cheerly*, are opposed to one another; the former being the order to lower gradually, and the latter to lower expeditiously.

LOWER Alloway's Creek, in *Geography*, a township of America, in Salem county, New Jersey.

LOWER Creek, a river of America, in the western territory, which runs into the Ohio. N. lat. $40^{\circ} 9'$. W. long. $80^{\circ} 43'$.

LOWER Dublin, a township of America, in Philadelphia county, Pennsylvania, containing 1495 inhabitants.

LOWER Landing, or Eagle Landing, lies on Niagara river, Upper

Upper Canada, opposite to Queenstown on the Niagara-fort side.

LOWER Marlborough, a post-town of America, in Maryland, 30 miles from Annapolis, and 12 from Calvert court-house.

LOWER Milford, a township of America, in Burk's county, Pennsylvania.

LOWER Penn's Neck, a township of America, in Salem county, New Jersey.

LOWER Weau Towns, lie in the territory NW. of the Ohio, 20 miles below Rippacanoe creek, at its mouth in Wabash river.

LOWER, in *Rural Economy*, a term provincially applied to a lever in some places.

LOWERING, in the *Distillery*, a term used to express the debasing of the strength of any spirituous liquor by mixing water with it. The standard and marketable price of these liquors are fixed, in regard to a certain strength in them called *proof*; this is that strength, which makes them, when shook in a phial, or poured from on high into a glass, retain a froth or crown of bubbles for some time. In this state spirits consist of about half pure or totally inflammable spirit, and half water; and if any foreign or home spirit is to be exposed to sale, and is found to have that proof wanting, scarce any one will buy it, till it has been distilled again and brought to that strength; and if it is above that strength, the proprietor usually adds water to it to bring it down to that standard. This addition of water, to debase the strength, is what is called lowering it. People well acquainted with the goods will indeed buy spirits at any strength, only lowering a sample to the proof strength, and by that judging of the strength of the whole; but the generality of buyers will not enter into this, but have it all lowered for them.

There is another kind of lowering in practice among the retailers of spirituous liquors: the vulgar: this is the reducing it under the standard of proof. They buy it proof, and afterwards increase their profit upon it, by lowering it with water one-eighth part. The quantity of spirit is what they generally allow themselves for the addition of water; and whoever has the art of doing this, without destroying the bubble proof, as this is easily done by means of some addition that gives a greater tenacity to the parts of the spirit, will deceive all that judge by this proof alone; that is, very nearly all who are concerned in the spirit trade. Such an additional quantity of water as one-eighth makes the spirit taste softer and cooler, and will make many prefer it to the stronger spirit, which is hotter and more fiery; but unless the spirit, thus lowered, were tolerably clean, or the proof be some other way preserved, the addition of the water lets loose some of the coarse oil, which makes the liquor milky, and leaves a very nauseous taste in the mouth. Shaw's Essay on Distillery.

The way to judge of spirits not being thus lowered or debased in strength, is to examine them by the eye and tongue; and in buying a quantity of proof goods, such should always be chosen as are clean, thin, and light, and have a good crown of froth, which goes off in large bubbles, such as taste soft and uniform, and are not high flavoured, of an alkaline gust, nor acrid and fiery, but soon quit the tongue.

LOWERING the Flag. See **FLAG**.

LOWES WATER, in *Geography*, a lake of England, in the county of Cumberland, about six miles in circumference; 10 miles S. of Cockermouth.

LOWEST REGION. See **REGION**.

LOWESTOFF, in *Geography*, a market-town and parish in the hundred of Mutford and Lothingland, on the coast of

Suffolk, England. For a considerable period it was denominated Lothwistoff, as some think, from Lothbroch, a noble Dane, who landed in this neighbourhood about the year 864, and *wistfa*, a half hide of land. This derivation of its name is extremely doubtful. The town, however, is certainly of much earlier origin. Mr. Gillingwater, in his "History of Lowestoff," says it can be traced back to a period anterior to the fourth century. This town has suffered much from the plague at different periods, particularly in the years 1348 and 1547. It has likewise sustained frequent plundering and depredations, on account of the attachment of its inhabitants to the cause of royalty.

The situation of this town is lofty, and exhibits a fine and commanding appearance. It extends about a mile in length, and consists chiefly of one principal street, running in a gradual descent from north to south, which is intersected by several smaller streets or lanes from the west. The whole is, in general, well paved, and many of the houses, having been lately rebuilt in the modern style, give the town an appearance of great neatness. From its situation and exposure to the northern ocean, over which it commands an extensive prospect, it enjoys a most salubrious air, keen, but bracing. On the declivity of the cliff a number of hanging gardens are formed, which are interspersed with alcoves and summer-houses. At the foot of these gardens is a long arrangement of fishing-houses, extending the whole length of the town. Between these and the beach stand the boats employed in the herring-fishery, which is the chief support of the town, 70,000 barrels being exported from hence every season. Here are also two light-houses, conveniences for boat-building, and accommodations for bathing. A considerable number of families resort here for the benefit of the salt-water. Besides these sources of wealth to the inhabitants, there is a tolerable mackerel fishery, which commences in May and continues till the latter end of June, and supplies the adjacent markets, as well as the metropolis. A small china manufactory, and a ropery, also belong to the town.

The church, situated about half a mile west from the town, is a very fine building, in the pointed style of architecture, and consists of a nave with two side aisles. The principal entrance is by a stately porch, on the south side of which are three niches, the centre one intended for the reception of a statue of St. Margaret, the saint to whom the church is dedicated. The chancel is particularly neat and elegant. The font, which is very ancient, is ascended by three stone steps, the upper one bearing an inscription, but so much corroded as to be almost unintelligible. It is surrounded by three rows of saints, each row containing twelve figures, and is otherwise finely adorned by carved work. Mr. Whiston, the friend of sir Isaac Newton, and some time professor of mathematics in the university of Cambridge, from which he was expelled for his Arian principles, was long vicar of this church. This town had likewise formerly three chapels of ease, but only one of them now continues to be used. There are dissenting meeting-houses here for Methodists and Presbyterians. A theatre was erected in 1790.

Lowestoff is protected by strong batteries on the sea-side. From its extensive fishery, it is a good nursery for seamen, and has given birth to several eminent naval officers. A great sea-fight took place off this town on the 3d of June, 1665, between the British fleet under the duke of York, and the Dutch fleet, which was commanded by admirals Opdam and Van Tromp, in which the latter were defeated with the loss of eighteen ships taken and fourteen sunk. In this action, admiral sir Thomas Allen, a native of this

town, particularly distinguished himself. In the vicinity of Loweloff formerly stood the village of Newton, which has been entirely swallowed up by the sea.

Loweloff, according to the parliamentary returns of 1800, contained 572 houses, and 2332 inhabitants. The market is held on Wednesday, and the fairs on the 12th of May and 19th of October. A very full history of this town has been published under the following title, "An historical Account of the ancient Town of Loweloff, with curious Remarks on the adjoining Parishes, and a general Account of the Island, by Edm. Gillingwater, 4to. 1790."

LOWHILL, a township of America, in Northampton county, Pennsylvania, containing 545 inhabitants.

LOWITZ, GEORGE MORITZ, in *Biography*, professor at Gottingen, and member of the Imperial Academy of Sciences at Petersburg, was born, in 1722, at Fürth, near Nuremberg. He was put apprentice to the trade of a goldsmith, and by his expertness in the business, he was enabled afterwards to construct and improve mathematical instruments, with the use of which he was well acquainted. He now turned his attention to science, and made a very uncommon progress in mathematics and natural philosophy. In 1748, he distinguished himself by constructing two charts of the solar eclipse, which was to take place in the following July. He afterwards observed the eclipse with great accuracy, by a new method of his own invention. Next year he published a chart representing the solar eclipse announced for the 8th of January, 1750, as it would appear to the inhabitants of Petersburg, Rome, Berlin, Nuremberg, Lisbon, &c. During these years he had been employed in the education of young persons, and in 1751 he was appointed professor of mathematics and natural philosophy in the Egidian seminary at Nuremberg, and was entrusted with the care of the observatory. On his entrance into this new office he pronounced an oration on the advantages which might be derived from the study of the higher branches of mathematics, which was printed in 1752. He published in the same year an account of various experiments on the properties of the air, which he employed as a guide in his lectures. About this time he removed to Gottingen, and was made professor of practical mathematics, with a salary of four hundred dollars. Having little to do as professor, he filled up his vacant hours in writing papers on various useful subjects; the greater part of these were read before the Royal Society of Gottingen, and they added, in a considerable degree, to his reputation. He was at the same time employed by the Cosmological Society in constructing globes; but, after a time, conceiving his services had not been sufficiently remunerated, he quitted the society with disgust. After this he was appointed, by the Hanoverian government, director of the observatory, an office which he resigned in 1764, together with the professorship; and he now resided at Gottingen as a private individual. He soon found that his means were insufficient for his support: his affairs became embarrassed, and his situation would probably have been forlorn, had not the Academy of Sciences at Petersburg invited him into Russia for the purpose of observing the transit of Venus, which was to take place in the year 1769. In a short time after this he was appointed a member of the Academy of Sciences in the astronomical department, and he was ordered to repair to Surjev, a small town on the river Ural, a few miles from the Caspian sea, the place destined for observing this curious phenomenon. This mission he accomplished in the completest manner, and published an account of it in the year 1770. He then proceeded, in the month of September, by the Caspian sea, to Astrachan, and having determined the geographical position

of that city, he repaired to some other places for the like purposes. He was next engaged in surveys for a new canal, which he continued, at different periods, till the month of August, 1774, when the whole undertaking was unfortunately stopped by a sudden and unexpected irruption of some rebel troops. Lowitz, and his friend and assistant, betook themselves to places which they hoped would afford them shelter and security. The latter, after burying his books, instruments, and other property, sought for safety in the fortrefs of Dnietrieffsk, from whence he proceeded to Astrachan. Lowitz, with his family, set out for the German colony of Dobriska, but unfortunately fell into the hands of the rebel chief, who put him to death in the most barbarous manner. His wife and son were suffered to escape after they had been plundered of the best part of their property: but Lowitz's books, papers, and instruments, having been deposited in an unoccupied house, were, by good fortune, preserved. Gen. Biog.

LOWK, in *Agriculture*, a provincial term, signifying to weed corn, or other crops sown broad-cast.

LOWKOW, in *Geography*, a town of Poland, in the palatinate of Volhynia; 10 miles E. of Zytmiers.

LOWLANDS, a denomination applied to the southern districts of Scotland, in contradistinction to the *Highlands*; which see. The inhabitants of these different districts differ from each other in language, manners, and dress; but the difference has been gradually decreasing. The language, manners, habits, and dress of the gentlemen in the Low Countries resemble those of their English neighbours, with whom they have frequent intercourse. The peasantry and middle class are sober, industrious, and good economists; hospitable and discreet, intelligent, brave, steady, humane, and benevolent. Their fidelity to one another is a striking feature in their character. In their mode of living and dress there are some peculiarities, but these are gradually wearing out. Within these few years the use of pottage, and bread of oatmeal, is almost disused among the commonalty, and tea, wheaten bread, and animal food, are as common on the north as on the south of the Tweed. See SCOTLAND.

LOWMAN, MOSES, in *Biography*, was born in London in the year 1679. He was originally intended for the profession of the law, was educated accordingly, and entered a student in the Middle Temple. When he attained to years of manhood, he abandoned the law, and determined to qualify himself for the office of minister among the Protestant dissenters. With this view he proceeded to Holland, and pursued his studies at Utrecht and Leyden, and on his return in 1710 he was chosen assistant preacher to a dissenting congregation at Clapham, of which he was afterwards elected pastor. In this connection he continued during the remainder of his life, discharging the duties of his station with constancy and regularity, esteemed and beloved by his flock, and highly respected by those who knew him. As an author, his first publication was in 1740, and intitled "A Dissertation on the Civil Government of the Hebrews, in which the true Design and Nature of their Government are explained, and the Justice, Wisdom, and Goodness of the Mosaic Constitutions vindicated, &c." In 1745, he published "A Paraphrase and Notes upon the Revelation of St. John," which is held in high estimation by the most judicious critics. The next work of Mr. Lowman was upon Jewish antiquities, intitled "A Rational of the Ritual of Hebrew Worship, &c." Besides these, he printed a small tract concerning "The Demonstration of a God, from the Argument a priori," and a sermon on Popery. He died in 1752, in the 73d year of his age. As he was a firm believer

believer in the Christian revelation, so he had imbibed the spirit which it recommends; and those virtues and duties which he inculcated upon others he carefully practised himself. *Biog. Brit.*

LOWESITZ, in *Geography*, a town of Bohemia, in the circle of Leitmeritz; four miles W.S.W. of Leitmeritz. N. lat. 50° 30'. E. long. 14° 9'.

LOWOWECH, or **NEUSTAT**, a town of the duchy of Warlaw; 32 miles W. of Posen.

LOWREY, a town of Hindoostan, in the circle of Gohnd; 36 miles E.S.E. of Raat.

LOWTAIAH, a town of Algiers; 27 miles S. of Tubnah.

LOWTH, **WILLIAM**, in *Biography*, a learned English divine and commentator of the scriptures, son of an apothecary, was born in the parish of St. Martin's, Ludgate, in the city of London, in the year 1661: he was instructed in the classics at Merchant Taylors' school, and made such progress in them that he was deemed fully qualified for the university before he was quite fourteen years of age, and was accordingly elected from thence into St. John's college, Oxford, in 1675. He took his degree of M.A. in 1683, and proceeded bachelor of divinity in 1688. His first publication was "A Vindication of the divine Authority and Inspiration of the Old and New Testament," in answer to Le Clerc's famous five letters on this subject. This work attracted public notice, and he was appointed chaplain to Dr. Mew, bishop of Winchester, and shortly promoted to a prebend in the cathedral church of that see, and to a rectory in Hampshire. Mr. Lowth next published a small piece, which has been very frequently reprinted, entitled "Directions for the profitable reading of the Holy Scriptures," &c. In 1714 he published two sermons, and also "A Commentary on the Prophet Isaiah," in quarto, which was followed, in 1718, by "A Commentary on the Prophet Jeremiah." In 1723 he gave the world his "Commentary on the Prophet Ezekiel," and soon after one on Daniel, and the minor prophets. These illustrations of the prophecies were afterwards collected in a folio volume, as a continuation of bishop Patrick's Commentary on the other parts of the Old Testament, in which form they have been frequently reprinted. Mr. Lowth, though an able scripture expounder, was a good general scholar, and furnished Dr. Potter, afterwards archbishop of Canterbury, with notes on Clemens Alexandrinus, which were published, with the author's name to each, in the doctor's edition of that father. He communicated to Dr. Hudson remarks on Josephus, of which that editor availed himself, and acknowledged his obligations in the preface to his edition of the Jewish historian. To the labours of Mr. Lowth many other learned men and valuable writers have been indebted, besides those above referred to. He died in 1732, being in the seventy-third year of his age. He was distinguished for unaffected piety, a most exemplary zeal in the discharge of the pastoral functions, and for an unremitting desire of being useful to his parishioners. *Biog. Brit.*

LOWTH, **ROBERT**, son of the preceding, was born at Winchester in the year 1710. Here he was educated in grammar learning at the school founded by William of Wykeham, in which he acquired an accurate knowledge of the Greek and Roman classics, and made considerable progress in oriental literature. Even at school he discovered a poetical genius, and among other pieces which he wrote at that period, was a beautiful poem on "The Genealogy of Christ," as it is represented on the east window of Winchester college chapel; and another, which appeared in the twenty-third volume of the Gentleman's Magazine, entitled

"Catherine's Hill," the place where the Winchester scholars are allowed to play on holidays. In 1728, he was sent to New college, Oxford, of which institution he was elected a fellow in 1734: took his degree as M.A. in 1737, and was, in 1741, elected professor of poetry in the university of Oxford. In the discharge of the duties of this office he delivered his "Prælectiones" on Hebrew poetry, which will be noticed more at large hereafter. His first preferment in the church was the rectory of Ovingdon, in Hampshire, to which he was presented by bishop Hoadly. In 1748, Mr. Lowth accompanied Mr. Legge, afterwards chancellor of the exchequer, to Berlin, who went to that court in a public character, and with whom, from his earliest years, he lived on terms of the most uninterrupted friendship. In the following year he undertook the charge of the sons of the duke of Devonshire, as travelling tutor on the continent. The duke was so thoroughly satisfied with the conduct of Mr. Lowth in this office, that he afterwards proved his steady friend and patron. In 1750 he was appointed archdeacon of Winchester, and three years after he was presented to the rectory of East Woodhay, in the county of Southampton. In 1753 he published his work already mentioned, entitled "De sacra Poesi Hebraeorum Prælectiones Academicæ;" of which he gave the public an enlarged edition in 1763, in two volumes 8vo. The second volume consists of additions made to the work by the celebrated Michaelis. This work, though entitled only "Lectures on Hebrew Poetry," will be found "An excellent compendium of all the best rules of taste, and of all the principles of composition, illustrated by the boldest and most exalted specimens of genius, which antiquity has transmitted to us, and which have seldom fallen under the inspection of rational criticism. But these lectures teach us not only taste, but virtue; not only to admire and reverence the scriptures, but to profit by their precepts. The author has penetrated into the very sanctuaries of Hebrew literature; he has investigated, with a degree of precision which few critics have attained, the very nature and character of their composition: by accurately examining, and cautiously comparing every part of the sacred writings; by a force of genius, which could enter into the very design of the authors; and by a comprehensiveness of mind, which could embrace, at a single view, a vast series of corresponding passages, he has discovered the manner, the spirit, the idiom of the original, and has laid down such axioms as cannot fail to facilitate our knowledge and understanding of the scriptures." Such is the opinion of this work given by the translator of it, the late Dr. George Gregory. Subjoined to the "Prælectiones" is "A short Confutation of Bishop Hare's System of Hebrew Metre." In the year 1754, the university of Oxford honoured the author with the degree of doctor of divinity, and in the following year he was nominated first chaplain to the marquis of Hartington, lord lieutenant of Ireland. Thither he accompanied that nobleman, and was, in a short time, offered the bishopric of Limerick, which however he exchanged for some preferment in the county of Durham, in his own country. In 1758, Dr. Lowth preached a sermon at Durham, on Free Enquiry in Matters of Religion, which has been frequently reprinted. In the same year he published his "Life of Wykeham, Bishop of Winchester," and founder of the colleges in which he had received his education. His next piece has been exceedingly popular in our schools, though now generally superseded by a work of the same kind by Mr. Lindley Murray, viz. "An Introduction to English Grammar." Passing over a controversy between Dr. Lowth and Dr. Warburton, which did not reflect much credit on

the angry tempers of the disputants; we may observe that Dr. Lowth was elected a fellow of the Royal Society at Gottingen in the year 1765, and in the following year he was promoted to the see of St David's, and almost immediately translated to the bishopric of Oxford. In this high office he remained till the year 1777, when he succeeded Dr. Terriek in the see of London. In 1778 he published the last of his literary labours, entitled "Isaiah: A new Translation, with a preliminary Dissertation, and Notes, critical, philological, and explanatory." His design, in this work, was not only to give an exact and faithful representation of the words and sense of the prophet, by adhering closely to the letter of the text, and treading, as nearly as may be, in his footsteps; but, moreover, to imitate the air and manner of the author, to express the form and fashion of the composition, and to give the English reader some notion of the peculiar turn and cast of the original. This version, excellent in itself, was not entirely faultless, and the mistakes were pointed out by Michael Dodson, esq. (See DODSON.) In 1779 the bishop was called on to preach a sermon before the king at the Chapel-royal, on Ash-Wednesday, in which he attacked the opponents to the ministerial system of government, among whom was the celebrated Dr. Richard Price, who defended himself with energy and spirit. In 1781 bishop Lowth was engaged in a law suit with Lewis Disney Ffytche, esq., concerning the legality of general bonds of resignation, which, if Dr. Towers's statement of the case be at all accurate, was highly discreditable to his lordship: suffice it to say, that in this case the decisions of the courts of law, almost unanimously pronounced, were unexpectedly reversed by the house of lords, by a small majority of *one*, and of the numbers who voted on this occasion fourteen were bishops, and as such parties in their own cause. (See Dr. Towers's Observations on the Cause between the Bishop of London, and L. D. Ffytche, esq.) In 1783 the bishop was fixed on to succeed archbishop Cornwallis, but on account of his advanced age he thought proper to decline the high honour of the archbishopric of Canterbury. In the latter years of his life he endured a great degree of suffering from that dreadful disorder, the stone, which he bore with fortitude and resignation to the divine will. He experienced also some of the most painful strokes of calamities which a father can experience, in the loss of affectionate children. In 1768 his eldest daughter died at the age of thirteen, of whom he was passionately fond, and whose death he deplored in the following exquisitely beautiful epitaph, which is inscribed on her tomb:

Cara, vale, ingenio præstans, pietate, pudore,
Et plusquam natæ nomine cara, vale.
Cara Maria, vale. At veniet felicius ævum
Quando iterum tecum, sim modo dignus, ero.
Cara, redi, keta tum dicam voce paternas,
Eja, age in amplexus, cara Maria, redi.

In 1783, his second daughter, as she was presiding at the tea-table, suddenly expired. His eldest son also, of whom he was led to form the highest expectations, was hurried to the grave in the bloom of youth. His lordship died at Fulham in 1787, having nearly completed the 77th year of his age. Of bishop Lowth's extensive learning, fine taste, and peculiar qualifications for the station which he filled, he has left abundant proofs. While his amiable manners rendered him an ornament to the high rank in which he moved, and endeared him to all with whom he conversed, his zeal for the established religion of the country made him anxious to promote to places of trust and dignity such cler-

gymen as he knew were best qualified to fill them. He united, in an eminent degree, the qualities of the gentleman with those of the scholar: he conversed with elegance, as he wrote with accuracy. His heart was tender and sympathetic. He possessed a mind which felt its own strength, and decided on whatever came before it with promptitude. In those trials where affliction was to be suffered or subdued he behaved as a man and a Christian. His piety had no tincture of moroseness; his charity no leaven of ostentation. The bishop was author of some sermons, preached on particular occasions, and of many poetical pieces, some of which have been frequently reprinted; the titles of which will be found in the General Biography.

LOWVILLE, in *Geography*, a post-town of America, in Oneida county, New York; 550 miles from Washington.

LOWYA, a town of Hindoostan, in Bahar; 15 miles S.S.E. of Bettiah. N. lat. 26° 35'. E. long. 84° 43'.

LOXA, or LOJA, called by Abulfeda *Lujchab*, an irregularly built town of Spain, in the province of Grenada, situated partly on the declivity and partly at the foot of a hill near the Xenil, about five leagues W. of Grenada, and taken from the Moors in 1486. It contains three parishes, four convents, four hospitals, a bridge, and the ruins of a castle; together with a salt-work and a copper forge. It is the chief town of a corregidor; the country about it is pleasing, fertile, and full of olive trees, gardens, orchards, fine fruit trees, and flowers. In the vicinity are immense numbers of hares and rabbits. Near the town, towards Grenada, are a small plain and a valley, both sown with corn, flax, and hemp, and producing also a great quantity of vegetables. N. lat. 37° 18'. W. long. 4° 18'. It contains about 8000 inhabitants.

LOXA, or *Laja*, a town of South America, the capital of a jurisdiction of the same name, in the province of Quito, founded in the year 1546, by captain Alonso de Mercadillo, and resembling in extent, form, and buildings, the city of Cuenca; but the temperature of the air is considerably hotter. Besides two churches, Loja has several convents, a nunnery, a college of Jesuits, and an hospital. In its district are 14 villages, and within the territory of its jurisdiction is produced the famous specific for intermitting fevers, well known by the name of Cascarilla de Loja, or Quinquina. (See CASCARILLA and CINCHONA.) The jurisdiction of Loja derives also great advantage from breeding the *Cochineal*; which see. The inhabitants of Loja, known over the whole province by the name of Lojanos, do not exceed 10,000 souls; though formerly, when the city was in its greatest prosperity, they were much more numerous. Their character is much better than that of the inhabitants of Cuenca; and besides their affinity in customs and disposition to those of the other villages, they cannot be reproached with the character of being slothful. In this jurisdiction such numerous droves of horned cattle and mules are bred, that it supplies the others of this province, and that of Piura in Valles. The carpets also manufactured here are of such remarkable fineness, that they find a ready sale wherever they are sent. The corregidor of Loja is governor of Yaguarfongo, and principal alcalde of the mines of Zaruma; but the post of governor of Yaguarfongo is at present a mere title without any jurisdiction; part of the villages which formed it being lost by the revolt of the Indians, and the others added to the government of Jaen; so that the corregidor of Loja enjoys only those honours intended to preserve the remembrance of that government. The town of Zaruma, in the jurisdiction of which are mines of gold, has presented the corregidor of Loja with the title

of its alcalde major. It was one of the first towns founded in this province, and at the same time one of the most opulent; but it is at present in a mean condition, owing chiefly to the decay of its mines, on which account most of the Spanish families have retired, some to Cuenca, and others to Loja; so that at present its inhabitants are said not to exceed 6000. The declension of these mines, which is owing to the negligence of those that are concerned in working them, more than to a scarcity of the metal, has been disadvantageous to the whole department of Loja; and consequently diminished the number of its inhabitants. S. lat. 4°. W. long. 79° 14'.

LOXA, a town of Sweden, in the province of Savolax; 108 miles N. of Nyflot.

LOXARTHUS, (from *λοξος*, *oblique*, and *αἰσεν*, *a joint*.) in *Surgery*, deformity of a joint.

LOXIA, in *Natural History*, a genus of birds of the order *passeres*, of which, according to Latham, there are eighty-five species; but in the last edition of Gmelin, there are an hundred species enumerated and described. This latter arrangement we shall follow in the present article. The essential character is as follows: the bill is strong, thick, convex, rounded at the base; the lower mandible is bent in at the edge; the nostrils are small, and round at the base of the bill; the tongue is truncate. The familiar name of this genus is *grosbeak*.

In the *loxia*, *emberiza*, and *fringilla* genera, both mandibles are moveable, by which means they are able to shell and break in pieces the seeds they feed upon. Of this numerous tribe there are but five species that are British, which will be noticed by asterisks prefixed to the specific names.

Species.

* **CURVIROSTRA**: Common cross-bill. Mandibles crossing each other; body varying in colour; wings and forked tail brown. Linn. *Le bec-croisé*, Briss. *Shield-apple*, or *cross-bill*, Willoughby. This is the most remarkable bird of the whole genus. Both mandibles are hooked, and turned different ways, so that they do not meet in a point. The bill, however, is not uniformly in the same direction: in some individuals the under mandible is twisted to the right, in others to the left side; a circumstance that has been noticed, to prove that the variation in the bill is rather owing to certain uses to which it is applied by the bird, than to any fixed appointment in nature. This species is found sometimes in Britain, though it is not by any means a constant visitor in these islands. It inhabits more generally the northern countries of Europe, especially some parts of Germany, Switzerland, Russia, Sweden, &c. where it is permanent the whole year. Birds of this species migrate, from unknown causes, into other countries, not regularly, but in the course of several years. They inhabit the pine forests, and feed upon the cones; for the scaling of which their bills are admirably formed. This bird is observed to hold the cone in one claw, like the parrot; and to have all the actions of that bird, when kept in a cage. It is said to make its nest in the very highest parts of the fir trees, fastening it to the branch with the resinous matter which exudes from the trees. Mr. Latham says, "I have never heard of its breeding in England, but know one instance of its being shot at large in the middle of summer. I have been told that they have done great damage in orchards, by tearing the apples to pieces for the sake of the seeds, the only part they delight in. Many are taken with a bird-call and bird-lime, and others by a horse-hair noose fixed to a long fishing-rod: for so intent are they on picking out the seeds of the cone, that

they will suffer themselves to be taken by the noose being put over the head.

There are two varieties: the one reddish, head scarlet; the other larger, bill thicker and shorter. The male is red, varied with brown and green, and is said to change its colours thrice a year; the female is olive-green, mixed with brown.

LEUCOPTERA; White-winged grosbeak. Mandibles crossing each other; feathers whitish, edged with red; rump pale red; vent whitish; tail and wings black, the latter with two white bands. It inhabits North America; is about six inches long. The bill is of a horn colour; legs are brown. Latham received specimens both from Hudson's Bay and New York.

PSITTACEA; Parrot-billed grosbeak. Olive colour; quill and even tail-feathers edged with yellowish; lower mandible much shorter. The plumage in the female is not unlike that of the male, except the head, which is the same as the other parts of the body, with a mixture of yellowish-grey about the sides of the head. It inhabits the Sandwich islands.

* **COCCOTHAUSTES**; Hawfinch. This is *le gros-bec* of Brisson, and is rather larger than the foregoing species. It is of a chestnut-ash colour; wings with a white line, having the middle quill-feathers rhombic at the tips; tail-feathers black at the base of the thinner web. The female is less bright in colour; the part between the bill and the eye is grey, instead of black. This may serve as a general description, but the colours vary very much. This species, though ranked among the British birds, visits these kingdoms occasionally, and for the most part in winter, and has never been known to breed here. It is more plentiful in France, where it may be seen in abundance about the beginning of April; and soon after makes its nest between the fork of the branches of trees, about ten or twelve feet from the ground. It is composed of small dry fibres, intermixed with liverwort, and lined with finer materials. The eggs are of a roundish shape, of a blueish-green, spotted with olive-brown, with a few irregular black markings interperfed. It is also common in Italy, Germany, Sweden, and the western parts of Russia, where the wild fruits grow: in the rest of the empire they are exceedingly scarce, except beyond lake Baikal, where they arrive from the south in great plenty, to feed on the berries of a tree peculiar to that country. From the strength of the bill, it cracks the stones of the fruit, of the haws, cherries, &c. with the greatest ease.

* **ENNUCLEATOR**; Pine grosbeak. *Gros-bec de Canada*, Brisson. *Le dur-bec*, Buffon. *Greatest bullfinch*, Edwards. Wings with a double white line; tail-feathers all black; head, neck, breast, and rump, in the young bird red, in the old bird yellow; female olive, or greenish-brown, with here and there a reddish or yellowish tinge, but chiefly at the top of the head. It frequents the most northern parts of this kingdom, being only met with in Scotland, and especially the Highlands, where it breeds, and inhabits the pine-forests, feeding on the seeds like the cross-bill. It is found in all the pine-forests of Siberia, Lapland, and the northern parts of Russia; common about St. Petersburg in the autumn, and is caught in great plenty at that time for the use of the table, returning north in the spring. These birds are likewise common in the northern parts of America, and appear at Hudson's Bay about the month of May, to which place they are said to come from the south, and are observed to feed on the buds of the willow.

MACROURA; Long-tailed grosbeak. Black; band on the wings and back reddish-yellow; tail long, wedged. Inhabits

hits Africa, near the Senegal. It is about seven inches long; the bill and legs are black.

AUREA; Gold-backed grosbeak. Black; back golden; wing-coverts pale brown, spotted with black; legs bluish. It inhabits Benguelo.

RUBICILLA; Caucasian grosbeak, so called from the Caucasian mountains which it inhabits. It is about eight inches long. Scarlet, spotted with white; belly and vent rosy; greater wing-coverts brown; tail black; feathers of the body cinereous at the base, giving the plumage a waved appearance.

* **PYRRHULA**; Bullfinch. *Le Bouvreuil*, Brisson. The bill of this bird is of a dark horn colour, the upper mandible hooked, and projects over the lower, which is roundish, like a parrot's; top of the head, feathers round the eye, and a spot under the beak, of a dark blue glossy black; the hind part of the neck and the back are grey; the throat and breast are of a beautiful flesh-coloured red; belly and vent white, as is the rump; quill-feathers and tail black; wing-coverts blue-black, the less ones tipped with white; legs very short and black. The female is black on the head, flight-feathers, and tail; breast and under parts of a reddish-brown; the rump whitish. There are three other varieties: 1. Entirely black. 2. White, back with a few black spots. 3. White; head, neck, breast, and belly rosy.

These birds are very troublesome visitors to the orchards and gardens, in the spring of the year; feeding on the buds of cherries, plums, and other fruit-trees. They retire to woods and close cover, to build their nests in May. They have no song in the state of nature, but are readily taught fine notes of music, and even to speak. Females are made as perfect as males in musical tunes. They form a slight nest of twigs laid crossways, and lay four eggs.

CARDINALIS; Cardinal grosbeak; Virginian nightingale. *Le gros-bec de Virginie*, Brisson. Crested, red; frontlet black; bill and legs blood-red; bill and legs pale rosy; crest, when erect, pointed. The female differs from the male, being mostly of a reddish-brown. This species is met with in several parts of North America, and has obtained the name of nightingale, on account of its fine song. In the spring, and most part of the summer, it sits on the tops of the highest trees, singing early in the morning, so loud as to pierce the ears; frequently kept in cages, in which it sings through the year: sometimes it is quite mute for a time, and again restless, hopping from perch to perch, and singing alternately. It inhabits North America; feeds on grain and Indian corn, which it hoards up.

CARLSONI. Red; chin black; rump, tail, wings, and legs brown. Inhabits the islands of the Indian sea; it resembles the *cardinalis*, but is not crested.

BOETONENSIS; Indian grosbeak. Crested, red; frontlet red; bill and legs yellow; the toes are long; claws sharp, pointed; wing-coverts black. It inhabits India, and is about eight inches long.

MADAGASCARIENSIS; Madagascar grosbeak. Red, ocular band black, back spotted with blackish; the bill also is black; wings and tail brown edged with olive. It is about five inches and a half long, and inhabits Madagascar. The young birds at first are olive, and do not arrive at the red colour but by degrees.

MEXICANA; Mexican grosbeak. Red; wings and tail black. It inhabits New Spain, and is about six inches and a half long.

BRASILIANA; Brazilian grosbeak. Brown; beneath reddish, with spots annulate with black; head and middle of the belly red; crescent on the nape and tip of the tail white;

the bill is of a flesh colour; wings and tail black; wing-coverts and secondary quill-feathers reddish at the tips. It is found in Brazil.

DOMINICANA; *Le gros-bec du Bresil*, Brisson; *American bullfinch*, Willoughby. Black; head and chin scarlet; breast, belly, and edge of the quill-feathers white; the neck is blackish above; back, rump, and wing-coverts grey a little spotted with black; vent and sides of the neck whitish; wings and tail black; legs cinereous. It inhabits Brazil. There is a variety; cinereous, beneath snowy; fore part of the head and throat red; tail-feathers black edged with cinereous, the outmost white on the outer edge. It is about the size of a lark.

CUCULLATA; Crested Dominican grosbeak. Cinereous; crested; head and chin scarlet; breast and belly white; tail long, the lateral feathers blackish. This, which by Latham is reckoned a variety of the *Dominicana*, and which is about the same size, inhabits Brazil.

SIBERICA; Siberian grosbeak. Size of a linnet, but fuller of feathers. Bill somewhat longer than that of a bullfinch; round the base of it the feathers are of a deep purple; head and back in some birds of a deep vermilion; in others of a rose-colour marked with brown, as in the linnet; the under parts paler, and not spotted. The female and young birds are of the colour of a linnet, with a tinge of red on the belly and rump.

This is a most beautiful species, and inhabits the bushy shrubs about the rivers and torrents of the southern mountains of Siberia, and particularly about lake Baikal; fond of the seeds of the blueish and other mugworts; it is a restless bird, and in winter unites into small flocks, and keeps in warmer situations among the shrubs.

VIRGINICA; Yellow-bellied grosbeak. Head, neck, middle tail-feathers, and body beneath red; belly yellow; nape, lower part of the back, wings, and lateral tail-feathers olive. The bill is yellow, and the bird is found in Virginia.

CRISTATA; Crested grosbeak. Whitish, front is crested; the rump and legs are red; middle tail-feathers very long. It inhabits Ethiopia, and is one of the largest of its tribe. Crest and breast in the male red, female white.

ERYTHROCEPHALA; Paradise grosbeak. *Le cardinal d'Angola*, Brisson; *Sparrow of Paradise*, Edwards. Pale ash; head purplish; breast spotted with white; bill and legs flesh colour; chin red; body beneath; a double oblique band on the wings white. It inhabits Angola.

MAJA; White-headed grosbeak. Brown; head white. It inhabits Malacca and China, and is about four inches long. The head and neck are whitish, and so also are the second and fourth quill-feathers.

FLAVICANS; Yellow grosbeak. Back greenish; head tawny; the wings and tail are of a greenish-yellow. It is the size of a canary bird, and is an inhabitant of Asia.

BONARIENSIS; Marigold grosbeak. Head and neck blue; body above blackish, beneath yellow; belly and vent sulphur; wings and tail blackish, edged with blue. It inhabits Buenos Ayres, where it is rarely seen till September; it frequents cultivated places and gardens; seen in pairs, and apparently very much attached to each other; feeds on grass and on seeds. The bill is blackish; the legs are reddish; claws sharp, curved, grooved, the hind-one very large.

ORYZIVORA; Java grosbeak. *Le gros-bec cendre de la Chine*, Brisson; *Paddy, or Rice bird*, Edwards. Cinereous; temples white; bill red. It inhabits China, Java, and Africa, is five inches long, and very destructive to rice plantations. The female has the bill and eye-lids very pale red,

red, and wants the white on the cheeks; but the edge of the wing is white as well as the under tail-coverts. It is thought to be a Chinese bird, by its being often met with on the paper hangings of that country. Latham thinks this the more likely, as he has seen it among some Chinese paintings, in which it bore the name of "Hung-tzoy."

FLABELLIFERA; Fan-tailed grosbeak. This species is the size of a sparrow; length about five inches. Bill stout and dusky; the upper parts of the body are reddish-brown, paler on the rump; the under the same, but somewhat paler, and more inclined to red; quills, tail, and legs dusky. One of these birds had a grey breast and belly. They inhabit Virginia, where they are called fan-tails, and continually carry the tail spread in an horizontal direction.

PANICIVORA; White-winged grosbeak. Black; spurious wings black; bill flesh-colour. It inhabits Africa, and is seven inches and a half long.

MALACCA; Malacca grosbeak. Bay; head and belly black; bill blue; the breast and flanks are white; and the legs are brown. It inhabits Java and China, and is rather more than four inches long. There is a variety that is ferruginous, head and lower part of the neck black.

MOLUCCA; Molucca grosbeak. Brownish; head, throat, and tail-feathers black; the bill is black; hind-head brown; rump waved white and black; wings and legs brown. It inhabits the Molucca isles.

PUNCTULARIA; Cowry grosbeak. Bay; belly black, spotted with white; the bill and legs black; hind-head and back reddish-brown; breast and flanks black, with hearted white spots, middle of the belly and vent white. It inhabits Java.

UNDULATA; Eastern grosbeak. Brown-red, beneath waved with brown; the tail is a pale red-ash. It inhabits Asia; is six inches long. The bill is short and strong.

HORDEACEA; Yellow-rumped grosbeak. Tawny; temples white; tail and breast black. Inhabits India.

SANGUINIROSTRIS; Red-billed grosbeak. Grey, beneath white; bill and legs red; the front and face are black; breast and belly pale ochre; the feathers are sometimes blackish in the middle; wings and tail brown. It inhabits some parts of Africa and Asia.

ASTRILD; Waxed-bill grosbeak. Brown waved with blackish; bill, orbit, and breast scarlet. It inhabits the Canaries, America, and Africa; is about four inches long; hides itself under grass and herbs, and feeds on seeds. There are two other varieties, viz. 1. Rump and vent scarlet. 2. Beneath rosy-white; crown, neck, and back blue; a scarlet band across the eyes.

LEUCURA; White-tailed grosbeak. Bill and legs red; head and wing-coverts cinereous; back yellow; breast and belly yellowish; tail white, the outmost feathers black. It inhabits Brazil, and is three inches long.

CYANEA; Angola blue grosbeak. Blue; wings and tail black; the bill is of a lead-colour, irides hazel, legs black. It inhabits Angola.

VIRENS. Greenish; shoulders blue; wings and tail black, edged with green. It inhabits Surinam.

ANGOLENSIS; Angola grosbeak. Black-blue; belly ferruginous; wings with a white spot; the bill is black; wings edged with white; legs purplish-flesh-colour. Found in and near Angola.

FERRUGINEA; Brown-headed grosbeak. Head and chin brown; body above black, beneath ferruginous; even tail and quill-feathers black, edged with yellow; the bill is of a horn colour, and the legs are pale; its length is about six inches.

MELANURA; Grey-necked grosbeak. Head and tail black; neck above brown; throat and vent grey; belly reddish; vent white; quill-feathers black, the primaries near the tip, and the secondaries on the inner edge, are white. It inhabits China, and is the size of the hawkfinch. The head of the female is grey.

AURANTIA; Orange grosbeak. Orange; crown black; quill and tail-feathers black, edged with orange. The female has the whole head, and fore-part of the neck, black; the under part of the body white; the rest of the body orange but less bright; and the quills edged with grey. It inhabits the isle of Bourbon, but some specimens have been sent from the Cape.

TORRIDA; White-billed grosbeak. Black; breast and belly bay; middle tail-feathers very long. It inhabits South America.

LINEOLA; Lineated grosbeak. Black; the frontal line and temples are white. The body above is black-blue, and beneath it is white; bill black, with a white spot above the upper mandible; tail is forked; quill-feathers black, the primary white at the anterior base. It is found in many parts of Asia and Africa.

HAMBURGIA; Hamburg grosbeak. Head and neck chestnut above; chin, band in the middle of the white throat, and rounded tail, brown; back, breast, and rump yellowish-brown, spotted with black; belly, vent, and two bands on the wing-coverts, white. It is about six inches long; inhabits Hamburg and its neighbourhood; feeds on insects, and climbs trees like a creeper.

MEXICANA; Yellow-headed grosbeak. Spotted with brown; front, chin, rump, and eye-brows pale yellow. It inhabits New Spain, and is nearly six inches long.

***CHLORIS**; Greenfinch. This is a well-known bird; the colour is a yellowish-green, palest on the rump and breast, and inclining to white on the belly; the quills are edged with yellow, and the four outer tail-feathers are yellow from the middle to the base; the bill is pale brown and stout; and the legs are flesh-colour. The female inclines more to brown.

The greenfinch is common in Great Britain, and makes its nest in some low bush, hedge, &c. composed of dry grass, lined with hair and wool; the female lays five or six eggs, marked at the larger end with red-brown: she is so anxious and careful of her charge during incubation, that she is often taken on the nest. The male takes his turn in sitting on the eggs. The greenfinch soon becomes tame; even old birds are familiar almost as soon as they are caught. It is apt to grow blind, like the chaffinch, if much exposed to the sun; it flies in troops in winter, and lives five or six years.

It is common in many parts of Europe, but in Russia it is rarely seen, and never in Siberia, hence it is imagined that it shifts its quarters according to the season. It is common in the northern parts of England and in many parts of Scotland.

SINENSIS; Chinese grosbeak. Head and neck greenish-grey; back pale brown; primary quill-feathers, the first half yellow, lower part black; secondaries within black, without grey, vent yellow. It inhabits China.

BUTYRACEA; Yellow-fronted grosbeak. Greenish; head and back spotted with black, beneath yellow; bill, tail, quill-feathers, and legs black. The front, eye-brows, and temples are yellow; spots on the female brown and the tail tipped with white. It is found in India and at the Cape.

DOMINENSIS; St. Domingo grosbeak. Green-brown, beneath pale rufous, spotted with brown; vent and area of

the eyes white; wings black; tail and legs brown. It inhabits St. Domingo.

AFRICANA; African grosbeak. Varied with greenish-brown and grey, beneath white; breast varied with brown; primary quill and lateral tail-feathers edged with reddish-white, the out-molt with a white spot. Inhabits the Cape of Good Hope.

HYPOXANTHA; Sumatra grosbeak. Yellowish; front and eye-brows pale yellow, quill and tail-feathers black, edged with yellowish. Inhabits Sumatra.

CANADENSIS; Canada grosbeak. *Le gros-bec de Cayenne*, Brisson. Size of a house-sparrow; bill ash-colour, and the edges of it somewhat projecting in the middle; the upper parts of the plumage olive-green; the under paler, and inclining to yellow; the feathers round the base of the bill, and the chin, black; the legs are grey. It inhabits Cayenne and Canada, as its different names signify.

SULPHURATA; Brimstone grosbeak. Olive-brown; throat and belly pale yellow; eye-brows yellow; it is about six inches in length, and inhabits in flocks near the Cape of Good Hope, frequents the banks of rivers, and builds a pendulous nest, with a long neck beneath, in trees and shrubs.

FLAVINENTRIS; Yellow-bellied grosbeak. Olive spotted with brown, beneath yellow; quill and tail-feathers brown, edged with olive; above the eyes a yellow stripe; the rump is olive coloured; tail forked; legs grey. Inhabits the Cape of Good Hope. There is a variety; hind-head, cheeks, and chin cinereous.

COLLARIA; Nun grosbeak. Yellowish; breast and collar yellow; temples black. There is a variety with a broader collar. Inhabits India and Angola.

GRISEA; Grey grosbeak. Blue-grey, neck and front white; bill and claws brown, legs reddish.

BENGALENSIS; *Le moineau de Bengale*, Brisson. *Yellow-headed Indian sparrow*, Edwards. *Bengal grosbeak*, Linn. Grey; crown yellow, temples whitish; belly whitish; spotted with brown. "This bird," says sir William Jones, "is exceedingly common in Hindoostan; he is astonishingly sensible, faithful, and docile; never voluntarily deserting the place where his young are hatched, but not averse, like most other birds, to the society of mankind; and easily taught to perch on the hand of his master. In a state of nature he generally builds his nest on the highest tree he can find; especially on the Pa'myra, or on the Indian fig-tree, and he prefers that which happens to overhang a well or a rivulet: he makes it of grass, which he weaves like cloth, and shapes like a bottle, suspending it firmly on the branches; but so as to rock with the wind, and placing it with its entrance downward, to secure it from the birds of prey. Its nest usually consists of two or three chambers; and it is popularly believed that he lights them with fire-flies, which he is said to catch alive at night, and confine with moist clay or with cow-dung. That such flies are often found in his nest, where pieces of cow-dung are also stuck, is indubitable; but as their light could be of little use to him, it seems probable that he only feeds on them. He may be taught with ease to fetch a piece of paper, or any small thing that his master points out to him. It is an attested fact, that if a ring be dropped into a deep well, and a signal be given to him, he will fly down with amazing celerity, catch the ring before it touches the water, and bring it up to his master with apparent exultation; and it is confidently asserted, that if a house, or any other place, be shewn to him once or twice, he will carry a note thither immediately on a proper signal being made. The young Hindoo women at Benares, and in other places, wear very thin plates of gold called *ticar*,

slightly fixed, by way of ornament, between their eye-brows; and when they pass through the streets, it is not uncommon for the youthful libertines who amuse themselves with training these birds, to give them a signal which they understand, and send them to pluck the pieces of gold from the foreheads of their mistresses, which they bring in triumph to their lovers.

MALABARICA; Malabar grosbeak. Cinereous; quill and tail-feathers black; chin and vent white; the bill is black. It inhabits India.

AFRA; Black-bellied grosbeak. Beneath black; head, flanks, and tail-coverts yellow; wings and tail brownish. It is found in Africa.

CAFFRA. Black, quill-feathers brown; shoulders red; plumage silky; bill brown-ash; quill-feathers at the edges and coverts white; tail longer than the body; legs grey. It is of the size of a bull-finch, and inhabits the Cape of Good Hope.

TOTTA. Quill and tail-feathers all black, the very tips white; the body is of a brownish colour, but beneath is a pale orange; front greenish-brown; it has six primary quill-feathers; eight secondary; ten tail-feathers beneath footy; flanks yellowish; legs black.

INDICA; Ash-headed grosbeak. Blackish, beneath whitish; head and neck cinereous; tail tip with white. Inhabits India; is very small; and has blue legs and bill.

ASIATICA; Asiatic grosbeak. Reddish-ash, beneath cinereous; belly pale red; head, greater wing-coverts, quill-feathers, and tip of the tail black. It inhabits China, and is the size of a bull-finch. There is a variety; blueish-ash; head, wings, and tail black; quill and two middle tail-feathers and tip of the tail black.

CANORA; Brown-cheeked grosbeak. Dirty greenish, beneath cinereous; cheeks brown, surrounded with a yellow fringe. It inhabits Mexico, and sings charmingly.

LINEATA; Radiated grosbeak. Black, beneath white; sides of the body, and base of the primary quill-feathers, transversely streaked with white and black.

PERLATA; Pearled grosbeak. Black, beneath brown; near the tail varied with white and black. It inhabits Africa.

FASCIATA; Fasciated grosbeak. Brownish, with black crescents; quill-feathers, tail, and cheeks brown, under the chin a broad red band; the bill is blueish-grey, and the legs are of a flesh-colour. It inhabits Africa.

CANTANS; Warbling grosbeak. Brown, transversely lined with blackish, beneath white; tail brown, wedged. It inhabits Africa, and is about four inches long. A variety of this species has a yellowish belly; chin and sides waved white and blackish, and is named the Gambia grosbeak.

MELANOCEPHALA; Black-headed grosbeak. Pale yellow; head black; bill cinereous; throat and irides black; legs blue-ash. It is about six inches long, and inhabits Gambia.

ERYTHROMEAS. Red; head and chin black; the bill is black, white at the base; tail rounded. Female above greenish-orange, mixed with red, beneath orange; quill-feathers olive, the outer edge rufous.

CORONATA; Black-crested grosbeak. Scarlet, beneath blue; crest on the head and spot in the middle of the throat black. It inhabits America.

CANA; Cinereous grosbeak. Hoary; quill and tail-feathers brown, legs red; bill cinereous; greater quill-feathers white at the base, blackish at the tips; tail blackish, edged with pale ash; legs flesh colour.

PHILIPPINA; Philippine grosbeak. Brown, beneath yellowish.

yellowish-white; crown and breast pale yellow; chin brown. The female has the upper parts brown, margined with rufous; rump of this last colour; legs yellowish. These inhabit the Philippine islands, and are noted for making a most curious nest, in form of a long cylinder, swelling out into a globose form in the middle. This is composed of the fine fibres of leaves, and fastened by the upper part to the extreme branch of a tree. The entrance is from beneath; and after ascending the cylinder as far as the globular cavity, the true nest is placed on one side of it, where, says Latham, this little architect lays her eggs, and hatches her brood in perfect security. There are three divisions in the nest of this bird; the first is occupied by the male, the second by the female, and the third contains the young; in the first apartment, where the male keeps watch, while the female is hatching, a little tough clay is placed on one side, and on the top of this clay a glow-worm, which is said to afford its inhabitants light in the night-time.

There is a variety of this species. Tail and quill-feathers greenish-brown, edged with yellow. Inhabits Abyssinia. This makes a nest somewhat like the former, of a spiral shape, not unlike that of a nautilus. It suspends it, like the other, on the extreme twig of some tree, chiefly one that hangs over some still water; and always turns the opening towards that quarter from whence least rain may be expected.

ABYSSINICA; Abyssinian grosbeak. Yellowish; crown, temples, throat, and breast black; shoulders blackish; quill and tail-feathers brown, edged with yellow. It inhabits Abyssinia; size of the lark; makes a pyramidal pendent nest, the opening of which is on one side, facing the east; it is divided in the middle by a partition, and the nest is within this cavity on one side; by this means it is secure from the intrusion of snakes, squirrels, monkeys, and other mischievous animals, and defended from the westerly rains, which last for several months almost unceasingly.

PENSILIS; Pensile grosbeak. Green; head and throat yellow; ocular band green; belly grey; vent rufous-red; bill, legs, tail and quill-feathers black, the last edged with green. This species inhabits Madagascar; is the size of a house-sparrow; constructs its pensile nest of straw and reeds, shaped like a bag, with an opening beneath, on one side of which is the true nest. The bird does not choose a new situation every year, but fastens a new nest to the end of the last; sometimes as far as five, one hanging from another; builds in large societies, and brings three young ones at each hatch.

A bird similar to this is mentioned in Kämpfer's History of Japan, which makes the nest near Siam, on a tree, with narrow leaves and spreading branches, the size of an apple-tree; the nest in the shape of a purse, with a long neck, made of dry grafs and other materials, and suspended at the end of the branches; the opening always to the north-west. The historian says he counted fifty on one tree only; and describes the bird itself as being like a canary-bird in colour, but as chirping like a sparrow.

SOCIATA; Sociable grosbeak. Rufous brown, beneath yellowish; frontlet black; tail short. This species inhabits the interior parts of the Cape of Good Hope: they live together in vast tribes under one common roof, containing several nests, which are built on a large species of mimosa; this, from its size, its ample head, and strong wide spreading branches, is well calculated to admit and support their dwellings. The taleness and smoothness of its trunk are also a perfect defence against the invasions of the serpent and the monkey tribes; in one tree described by a very intelligent traveller, Mr. Paterfon, there were

several hundred nests under one general roof. It is described as a roof, because it resembles that of a thatched house, and projects over the entrance of the nest below in a singular manner. "The industry of these birds," says this author, "seems almost equal to that of the bee. Throughout the day they seem to be busily employed in carrying a fine species of grafs, which is the principal material they use for the purpose of erecting this extraordinary work, as well as for additions and repairs. Though my short stay in the country was not sufficient to satisfy me by ocular proof that they added to their nest as they annually increased in number; still, from the many trees which I have seen borne down by the weight, and others which I have observed with their boughs completely covered over, it would appear that this is really the case. When the tree, which is the support of this aerial city, is obliged to give way to the increase of weight, it is obvious that they are no longer protected, and are under the necessity of building in other trees. One of these deserted nests I had the curiosity to break down, to inform myself of the internal structure of it; and found it equally ingenious with that of the external. There are many entrances, each of which forms a regular street, with nests on both sides, at about two inches distance from each other. The grafs with which they build is called the Boshman's grafs, and I believe the seed of it to be their principal food; though, on examining their nests, I found the wings and legs of different insects. From every appearance the nest which I dissected had been inhabited for many years, and some parts of it were much more complete than others. This, therefore, I conceive to amount nearly to a proof that the animals added to it at different times, as they found necessary from the increase of the family, or rather of the nation or community."

STRIATA; Striated grosbeak. Brown, streaked with ferruginous, beneath white; throat black. About the size of a wren. It inhabits Bourbon.

ZEYLONICA; Ceylon grosbeak. Ferruginous brown, beneath purple, waved with black; front and rump blueish. Inhabits Ceylon.

LUOVICIANA; Louisiana grosbeak. Black; breast, belly, band on the wings, and base of the quill-feathers white. Inhabits North America, and is about six inches long. There is another variety with a rosy breast.

MACULATA; Spotted grosbeak. Feathers of the upper part of the body black, spotted with white towards the tip, of the lower part whitish, streaked with black; quill and tail-feathers whitish on the outside. It inhabits America.

OBSCURA; Dusky grosbeak. Middle of the throat, and double band on the wing-coverts white; quill-feathers green, flanks white, spotted with brown; feathers of the head, neck, and back edged with brown. Inhabits in the neighbourhood of New York.

HUDSONICA; Hudson's Bay grosbeak. Brown; belly white, sides spotted with brown; wing-coverts with two red bands. It inhabits Hudson's Bay, from whence it derives its name. It has strong bill and legs; feathers of the back and rump, secondary quills and tail-feathers edged with pale rufous; tail a little forked.

CAPENSIS; Cape grosbeak. Blackish-brown; rump and wing-coverts pale yellow. There is a variety with feathers above brownish, in the middle spotted with black, beneath whitish, spotted with black. The bill and legs black; feathers of the head short, and in breeding time silky; wings chisaut, edged with grey; greater quill-feathers edged with yellow, back sometimes pale yellow. Inhabits

Coromandel and the Cape; is found chiefly in thickets near rivers; eggs cinereous, spotted with black.

NIGRA; Black grosbeak. *Le bouvreuil noir du Mexique*, Brisson and Buffon. *Little black bullfinch*, Catfby, Albin. &c. This species is of the size of a bullfinch; the bill is black, stout, and deeply notched in the middle of the upper mandible; plumage black, except a little white on the fore part of the wing, and base of the two first quills; legs black. Inhabits Mexico.

CRASSIROSTRIS; Thick-billed grosbeak. Black; base of the quill-feathers, and middle tail-feathers in the middle white; legs whitish; the bill is thick and yellowish.

REGULUS; Crimson-crested grosbeak. Bill very thick and strong. There was a fine specimen of this bird in the Leverian museum.

AMERICANA; Black-breasted grosbeak. Black; beneath white; pectoral band black; wings with a double white band; tail rounded; legs brown. It inhabits America.

CERULEA; Blue grosbeak. *Le bouvreuil bleu de la Caroline*, Brisson. This species is the size of the bullfinch; bill half an inch, stout, and brown: the base of it furrounded with black feathers, which reach on each side as far as the eye; the whole plumage besides is of a deep blue, except the quills and tail, which are brown with a mixture of green, and across the wing-coverts a band of red; the legs are dusky. The female is brown with a little mixture of blue.

"I suspect," says Latham, "this to be Bancroft's bird, which he says is sky-blue, with the outer edges of the quills and tail crimson; and the more so, as I have lately met with one from Cayenne, which had the chin, as well as round the bill, black, and both the shoulders, some of the wing-coverts, and the edges of the secondaries, marked with reddish."

URIX; Grenadier grosbeak. Grey; bill, front, and belly black; neck and rump tawny; sometimes the wings are white, and the tail is brown. It is the size of a sparrow; inhabits Africa, and is found chiefly in marshy grounds and among the reeds. The nest is formed with small twigs, so closely interwoven with cotton, as not to be penetrated in any weather. It is divided into two compartments, of which the upper is for the male, and the lower for the female and the young.

FLAMINGO. White; head, neck and breast, and belly rosy. Inhabits Upsal; resembles the bullfinch; bill and legs reddish; feathers of the frontlet blackish at the tips; third and fourth quill-feathers and spot on the rump black; transverse line on the wings and upper surface of the tail footy.

VIOLACEA; Purple grosbeak. *Le bouvreuil violet de Bahama*, Brisson. *Black sparrow*, Raii Syn. This is the size of the sparrow; bill is black; plumage violet black, except the irides, a streak over the eye, the chin, and the vent, which are red; legs dusky grey. Where the male is black, the female is brown, and the red is not so bright; it inhabits the Bahama islands, Jamaica, and the warmer parts of America.

GROSSA; White-throated grosbeak. Bluish hoary; throat and tail-feathers blackish; chin white; bill red. Inhabits America.

MINIMA; Dwarf grosbeak. Brown; beneath testaceous; primary quill-feathers at the base and secondaries on the hind-part white. This species is very small; it inhabits Surinam.

FUSCA; Brown grosbeak. *Le petit bouvreuil noir d'Afrique*, Brisson. Size of a canary bird; bill short and thick,

and of a lead colour; the head and upper parts of the body brown; the under of a pale ash-colour; vent pure white; the quills dusky black; the base of eight of the middle quills white; tail the colour of the quills, with palish ends; legs pale. It is an inhabitant of Africa, and is met with at Bengal.

GUTTATA. Brown; breast black; bill and rump red; sides of the body black spotted with white. It inhabits New Holland.

SEPTENTRIONALIS; Northern grosbeak. Black; wings with a white spot. Inhabits Scandinavia; resembles the bullfinch.

MINUTA; Minute grosbeak. Grey; rump and belly beneath ferruginous; some quill-feathers on each side white at the base; tail entire. It inhabits Surinam and Cayenne; is very small, active, and bold; frequents inhabited places, and feeds on seeds and fruit. Bill and legs brown; cries like a sparrow; makes a roundish nest, composed of a reddish herb, and placed on the trees which it frequents.

BICOLOR; Orange-bellied grosbeak. Brown; beneath red; another variety; brownish, beneath white; chin somewhat ferruginous. Inhabits India; the bill is whitish and legs are brown.

PRASSINA; Red-rumped grosbeak. Olive-green, beneath yellowish hoary, rump pale red; legs yellow. This is the description of the male; the female of a variety is olive brown, beneath yellowish hoary; rump pale red; legs yellowish.

TRIDACTYLA; Three-toed grosbeak. *Le Guifso Balito*, Buffon. Bill toothed on the edges; the head, throat, and fore-part of the neck of a beautiful red, which is prolonged in a narrow band quite to the vent; the upper part of the neck, back, and tail black; the wing-coverts brown, edged with white; quills brown, with greenish edges; legs dull red; the wings reach half way on the tail; the toes three only, two before and one behind.

This inhabits Abyssinia; frequents woods, and is a solitary species; feeds on kernels and seeds, which it breaks with the greatest ease with its bill. Latham, Lewin, Gmelin's Linnaeus, &c. &c.

LOXOCARYA, in *Botany*, from *λοξος*, oblique, and *καρυα*, a nut. Brown Prodr. Nov. Holl. v. i. 249. This genus is separated from *Reclinia*, solely on account of its having an undivided style, and a fruit of one cell, which is as it were a third part, or one lobe, of that of *Reclinia*. We presume to think this distinction scarcely sufficient. One species only is mentioned.

L. cinerea; found by Mr. Brown in the south part of New Holland.

LOXODROMIC TABLE. See TABLE.

LOXODROMICS, the art or method of oblique sailing, by the loxodromy, or rhumb.

LOXODROMY, **LOXODROMIA**, formed of *λοξος*, oblique, and *δρομος*, course, the line which a ship describes in sailing on the same collateral rhumb.

The loxodromy, called also the *loxodromic line*, cuts all the meridians in the same angle, called the *loxodromic angle*. This line is a species of the logarithmic spiral, described on the surface of the sphere, having the meridians for its radii.

LOYAL, in the *Manege*. A horse is said to be loyal, that freely bends all his force in obeying and performing any manege he is put to; and does not defend himself, or resist, notwithstanding his being ill treated.

A loyal mouth is an excellent mouth, of the nature of such as we call mouths with a full rest upon the hand.

LOYALSOCK CREEK, in *Geography*, a river of America,

rica, in Northumberland county, Pennsylvania, which runs into the W. side of the branch of Susquehannah river, from the N.E.: 26 miles from Sunbury. It is navigable 20 or 30 miles up for batteries of 10 tons. N. lat. 41° 15'. W. long. 77° 1'.

LOYHA, a small island on the E. side of the gulf of Bothnia. N. lat. 65° 6'. E. long. 25°.

LOYOLA, IGNATIUS DE, in *Biography*, celebrated as the founder of the order of Jesuits, was descended from a noble Spanish family, and born in 1491, at the castle of Loyola, in the province of Guipuscoa, whence he derived his surname. At an early age he was appointed page at the court of Ferdinand and Isabella, and was shewn distinguished marks of favour. But the indolence and tameness of a courtier's life did not accord with young Loyola's active disposition; he panted for fame, and to attain to a conspicuous situation, he determined to enter into the army. He was taken under the patronage of the duke de Najara, a grandee of Spain, a soldier of high reputation, and under his auspices, he passed through different degrees of military rank, and discovered on all occasions great courage, and a strong attachment to the service. His morals, which had been corrupted at court, were not reformed in the army, where, following the example of those about him, he addicted himself to the licentiousness too prevalent in the military life; he was, however, possessed of a high sense of honour, was frank, disinterested, and generous, and much beloved by those who served under him. In 1521, he had the command of the citadel of Pampluna, then besieged by the French, and after displaying the utmost valour in repelling the enemy, he was in a moment disabled by a severe wound in the left leg, and by a cannon shot which broke his right. The garrison having thus lost the example of their leader, surrendered at discretion. The French paid every attention to Loyola, and as soon as he was in a state fit to be moved, they sent him in a litter to his native place. It was a considerable time before a cure was effected, and during that period he happened to have no other source of amusement than what he found in reading the lives of the saints, the effect of which on his mind, was to inspire him with a desire of emulating the glory of the most celebrated among them. From this time he resolved to renounce the vanities of the world, to visit the Holy Land, and to devote himself to an austere religious life. Hence he undertook a pilgrimage to our lady of Montserrat, to hang up his arms near her altar. His zeal at this time was without all bounds; he attempted to take away the life of a person who suggested a doubt whether the Virgin Mary had remained pure and immaculate after her delivery. Having arrived at Montserrat, he adopted a new method of consecrating himself to the service of the Virgin; he stripped off his clothes, which he gave to a poor man, put on a coarse garment of sackcloth, girded himself with a cord, from which was suspended a gourd for carrying water, put a matted shoe on one foot, which had not yet recovered the injury produced by his wounds, leaving the other naked and his head exposed to the violence of the weather, and substituting in the place of his lance a plain crab-tree staff. Thus equipped, he presented himself before the altar of the Holy Virgin, hung his military weapons on a pillar near the altar, and watched all night, sometimes kneeling and sometimes standing, devoting himself as a champion. Early in the following morning Loyola departed on foot for Manresa, three leagues from Montserrat, intending to go through a course of penance, by way of preparation for his expedition to the Holy Land. He underwent, for the space of twelve months, the most rigorous mortifications of every

kind, after which he commenced his labours of spiritual exhortation, both in private families and in public places, and in a very short time he published his book entitled "Spiritual Exercises." Loyola, intent upon visiting the Holy Land, embarked for Italy, and proceeded to Rome to obtain the pope's blessing, which he obtained from Adrian VI. with leave to pursue his pilgrimage to Jerusalem. After visiting the scenes of our Saviour's principal transactions in that city, and the surrounding country, and going through the exercises usually performed by pilgrims, Loyola formed the design of remaining in Palestine, for the purpose of devoting himself to the conversion of the inhabitants of the East. This design he communicated to the father guardian of the Franciscans, by whom he was referred to the father-provincial, who, aware of the danger of the enterprise, refused his consent, and sent Loyola back to Europe. At Barcelona he commenced a course of school learning, which he completed in two years, and then went to the university of Alcalá de Henares, where he suffered himself to be diverted to other objects besides literature, and of course made but a mean progress in his studies. He had taken as his model the works of Thomas à Kempis, which he was perpetually reading. He spent a considerable portion of his time in the service of the sick, in begging excursions, and in instructing and exhorting the people. Loyola had now associated himself with four companions who imitated his plans of life, and looked up to him as a master and leader. Their different dress, and extraordinary manner of living, induced multitudes to become their followers: this awakened the jealousy of the inquisitors, who instituted enquiries relative to Loyola's doctrine and behaviour, and having found that he was a believer in the sound faith, he was dismissed. After this he was some time imprisoned on the suspicion of having persuaded a lady of rank and her daughter to undertake a long pilgrimage barefoot. Being liberated, he went to Salamanca, and was a second time imprisoned through the interference of the Dominican monks, who were jealous of his popular exertions in a religious course. He was now determined to abandon his native country, where he was subject to so many hindrances in what he conceived the way of his duty: he accordingly went to Paris in 1528, where he recommenced the study of the Latin language at Montague college; went through a course of philosophy in the college of St. Barbara, and studied divinity under the Dominicans. His zeal in instructing others exposed him to trouble in Paris, as it had done in the Spanish universities, and he narrowly escaped whipping in St. Barbara's college-hall. No suffering had the effect of cooling his zeal; he formed an association among the scholars of that college, the members of which took a vow to conform to a strict religious discipline, and to engage in a new undertaking for promoting the interests of the Catholic faith. They agreed to preach in public places, and in every place where they could obtain permission, recommending the beauty and rewards of virtue, and pointing out the deformity and punishments of vice, and this in a simple evangelical manner, without the vain ornaments of eloquence; that they should instruct children in the Christian doctrine, and the principles of right conduct, and that they should receive no money for exercising their functions, but be governed in all their proceedings by a view to the glory of God. The society thus formed was to be denominated "The Company of Jesus." Loyola was now anxious to obtain the approbation of the pope, in order that a new institution might be formed under his sanction. His holiness, Paul III. referred the petition of Loyola to the committee of cardinals, who violently opposed the esta-

blishment of such an order, representing it not only as unnecessary but extremely dangerous. He again threw himself at the feet of the pope, and proposed that besides the three vows of poverty, chastity, and monastic obedience, which are common to all the orders of regulars, the members of his society should take a fourth vow, of obedience to the pope, binding themselves to go whithersoever he should command for the service of religion, and without requiring any thing from the holy see for their support. This was a proposal which the pope could not reject; he confirmed the institution of the Jesuits by a bull, granted the most ample privileges to the members of the society, and appointed Loyola to be the first general of the order. (See our article *JESUITS*.) In 1550, he was desirous of resigning his office of general, but the society would not consent to the measure, and he retained it till his death in 1556, when he was in the sixty-fifth year of his age. Before that event, he had seen his order spread over the greatest part of the old and new worlds, and he had established, in the short space of sixteen years, twelve large provinces, containing at least an hundred colleges. He was beatified by pope Paul V., and in 1622 he was canonized by Gregory XV. Bayle. Moreri. Robertson, and art. Jesuits.

LOYOLA, in *Geography*, a village of Spain, in the province of Guipuscoa, formerly belonging to the family of Ignatius, founder of the order of Jesuits. See *JESUITS*.—Also, a town of South America, in the audience of Quito; 50 miles S. of Loxa.

LOZE, a river of Congo, in Africa, which runs into the Atlantic, navigable for boats, but having no harbour at its mouth. S. lat. 7° 55'.

LOZENGE, or **LOZANGE**, in *Geometry*, a kind of parallelogram, or quadrilateral figure, consisting of four equal and parallel lines or sides, whose angles are not right, but whereof two opposite ones are acute, and the other two obtuse; the distance between the two obtuse ones being always equal to the length of one side.

Scaliger derives the word lozenge from *laurengia*; this figure resembling, in some respects, that of a laurel leaf. In geometry, it is ordinarily called *rhombus*; and, when the sides are unequal, *rhomboids*.

LOZENGE, in *Heraldry*, is a rhombus, or figure of equal sides, but unequal angles; resembling a quarry of glass in our old windows; placed erect, point-ways. It is in this figure that all unmarried gentlewomen and widows bear their coats of arms; because, as some say, it was the figure of the Amazonian shield; or, as others, because it is the ancient figure of the spindle.

The lozenge differs from the *fusil*, in that the latter is narrower in the middle, and not so sharp at the ends.

LOZENGES, among *Jewellers*, are common to brilliant and rose diamonds. In the former they are formed by the meeting of the skill and star-facets on the bezel; in the latter, by the meeting of the facets in the horizontal ribs of the crown.

LOZENGE is also a sort of medicine, made into small pieces, to be held or chewed in the mouth till they are melted there; the same with what are otherwise called *trochisci*.

LOZERE, in *Geography*, one of the nine departments of the southern region of France, composed of Cevennes and part of the Cevennes, N. lat. 44° 30', S.E. of Cantal, and S. of the Upper Loire, 18 French leagues long, and 15 broad, contains 5390 kilometres, or 269 square leagues, and 1,502,7 inhabitants. It is divided into three districts, 24 cantons, and 193 communes. The districts are Marvejols, including 60,750 inhabitants; Mende, 52,813;

and Florac, 42,364. Its capital is Mende. Its contributions amount to 892,776 fr. and its expences to 179,687 fr. The northern districts consist partly of granite mountains; towards the middle of the department the hills are calcareous; and in the southern part the Cevennes are composed of schistus. A considerable proportion of this territory is not susceptible of culture. The chief products are barley, flax, hemp, fruits, and pastures for sheep. Here are mines of iron, copper, lead, and antimony, with mineral springs.

LOZICZE, a town of Poland, in the palatinate of Bielsk; 56 miles S.W. of Bielsk.

LOZZI, a town of the island of Corsica; 11 miles N.W. of Corte.

LOZZO, a town of Italy, in the Paduan; 8 miles S.S.W. of Padua.

LU, a town of France, in the department of Marengo; 8 miles W. of Alexandria.

LU, in *Chinese Music*, implies a key. Dividing the octave into 12 semitones, they give the name of *lu* to each, numerically. See *CHINESE MUSIC*.

LUA, in *Geography*, a river of the island of Cuba, which runs into the sea; 25 miles N.E. of Cape Cruz.—Also, a town of Arabia, in the province of Oman, on the coast; 10 miles N. of Sohar.

LUA, in *Mythology*, a Roman divinity mentioned by Livy, lib. viii. and invoked in war. The name is supposed to be derived from *luere*, to expiate.

LUABO, in *Geography*, a river on the W. coast of Africa, a branch of the great river Zambezi, which separates from it at the distance of 30 leagues from the sea.—Also, an island situated between the Luabo and Zambezi. See *MOCARANGA*.

LUANA POINT, a cape on the S. coast of Jamaica. N. lat. 18° 2'. W. long. 77° 50'.

LUANCO, a town of Spain, in Asturia, near the W. coast; 20 miles N. of Oviedo.

LUANZA, a town of Africa, in the country of Mocaranga. S. lat. 17° 15'. E. long. 32° 30'.

LUARCA, a sea-port town of Spain, on the N. coast, in the province of Asturias; 30 miles N.W. of Oviedo.

LUBAD, a town of Asiatic Turkey, in Natolia, on a lake of the same name, 21 miles long, and four broad; 7 miles S. of Bursa.

LUBAN, a town of Lithuania, in the palatinate of Novogrodek; 20 miles S.E. of Sluck.

LUBAN, or *Lulan*, one of the Philippine islands, about 12 miles in circumference.

LUBARTOW, a town of Poland, in Volhynia; 36 miles W. of Berdyczew.

LUBASZYN, a town of Lithuania, in the palatinate of Minsk; 52 miles E. of Minsk.

LUBAT, a town of Asiatic Turkey, in Natolia; 28 miles W. of Bursa.

LUBATCHOW, a town of Austrian Poland, in Galicia; 16 miles N. of Lemberg.

LUBBECHE, or **LUTHICKE**, a town of Westphalia, in the county of Minden, consisting of about 258 dwelling-houses, which obtained the privileges of towns in 1270, and was surrounded with ramparts, ditches, and walls. This town enjoys several immunities, and particularly a territorial jurisdiction over a considerable district. Its chief trade consists in yarn and linen, breeding of cattle, and brewing of beer. It has sustained, at several times, great damage by fire; 14 miles W. of Minden.

LUBBEN, or **LUBIO**, a town of Lower Lusatia, situated on the Spree, in a circle to which it gives name; 36 miles

36 miles S. of Berlin. N. lat. $51^{\circ} 37'$. E. long. $13^{\circ} 45'$.

LUBBERT, SIBRAND, in *Biography*, a theological professor and divine, was born at Langoworde, in Friesland, about the year 1556. He studied in the colleges of Bremen and Wittenberg. He afterwards went to Geneva, and diligently attended the lectures of Beza, Casaubon, and Francis Portus. From Geneva he went to Newstadt, and attended the lectures of the learned Zachary Ursinus, who, after a time, recommended him as his own successor as professor of logic, an honour which he declined, and accepted soon after an invitation to become pastor of a congregation at Embden. The duties of this office he discharged with singular fidelity and zeal. In 1584, he removed to Friesland, and was appointed preacher to the governor and deputies of the states of that province; also professor of divinity in the new university of Franeker. He went to Heidelberg, where he was admitted to the degree of doctor of divinity, and then returned to his professorship, which he occupied with reputation nearly forty years. During this period he was often employed in very important affairs. He died at Franeker in 1625, at the age of sixty-nine. He was author of many learned pieces against Bellarmine: he published a work against Socinus, and he wrote against Arminius, Vorstius, Grotius, and the other defenders of the cause of the Remonstrants. His last work was a commentary on the Catechism of Heidelberg. Bayle. Moreri.

LUBCZ, in *Geography*, a town of Russian Lithuania; 25 miles N. of Novogrodek.

LUBECK, a city of Germany, one of the three cities of the Hanseatic league, acknowledged as such, together with Hamburg and Bremen, in the definitive treaty of indemnities, 25th of February 1803, with the guarantee of their jurisdiction and perpetual neutrality. It is also one of the college of imperial and free cities. It is situated within the limits of Holstein, on the navigable river Trave, communicating by several streams with the Baltic and German ocean. The town stands on the two declivities of a long hill, moderately high, the eastern part extending towards the navigable river Wackenitz, and the western towards the Trave. Besides walls and towers, it is so surrounded by strong ramparts, and wide moats. The streets are for the most part steep, and the houses built of stone, and old fashioned, the doors being so large as to admit carriages into the hall, which serves frequently for a coach-house. The established religion, ever since the year 1530, has been Lutheranism. It has four parochial churches, as well as the cathedral of an ancient see. The archbishopric of Lubeck lies in that part of the duchy of Holstein, which was anciently called "Wagria." Its see was first erected by the emperor Otho I. at Oldenburg, in 951, for the conversion of the Wends, or Venedi, who inhabited this country, and transferred to Lubeck in the year 1164. The reformation of the diocese was begun under bishop Henry of Bochoitz, and being promoted by his successors, was accomplished in 1561. The bishop of Lubeck, though a prince of the empire, yet in the college of princes sat neither on the spiritual nor temporal bench, but on a particular bench placed cross-ways, and laid there for him and the bishop of Osnabruck, when a Lutheran. He had also a vote among the princes of the circle of Lower Saxony. The cathedral stands in the imperial city of Lubeck: but is invested with no authority. The chapter consists of thirty persons, who, with the exception of four Roman Catholics, are all Lutherans. When the indemnities were settled at Ratisbon in 1802, it was decreed that the bishopric with its chapter should be secularised in favour of the duke of Oldenburg;

reserving only the property within the city, which was to be added to the domain of the city. Lubeck was once the chief city of the *Hanseatic league*, which see; but this honour now belongs to Hamburgh. On the spot where it now stands was formerly a town named "Bucu;" but when this was demolished, about the year 1144, Adolphus II. count of Holstein and Schaumburg laid the foundation of this city, which, in process of time, became so famous. In 1156 the town, which had suffered much from fire, was given by count Adolphus to duke Henry, which, being rebuilt, he erected into a free port, and conferred upon it a municipal right of great importance. This was confirmed in 1188, by the emperor Frederick I., and afterwards by succeeding emperors. In 1276, the whole city, five houses excepted, was destroyed by fire. Lubeck has various manufactures, and its trade is very considerable, partly owing to the commodiousness of its situation. The quay of Lubeck is on the river Trave, which falls into the sea at the distance of 14 miles, and admits vessels from 150 to 200 tons burden, and sometimes, but rarely, 300. Mr. Coxe observed about 120 merchant ships destined to Russia, Sweden, and Denmark. The trade, however, is chiefly a trade of commission, drawing from Russia, Sweden, and Denmark their raw commodities, and supplying them with wines, silks, cloth, and steel ware. The exports, partly by Lubeck, and partly by Hamburgh, are grain, flax, hemp, hops, wax, honey, cattle, butter, cheese, fruits, feathers, dried geese, tallow, linseed, wool, and timber. Lubeck, according to Hoeck, contains 30,000 inhabitants. It was taken by the French in 1806. N. lat. $53^{\circ} 52'$. E. long. $10^{\circ} 45'$.

LUBCK, or *Luboi*, an island in the East Indian sea, near Madura. Its distance W. of Tonikaky is about 112 leagues; and W. from the islands of Salemba 31 leagues. S. lat. $5^{\circ} 43'$. E. long. $112^{\circ} 44'$.

LUBEN, a small town of Silesia, with large suburbs, in the principality of Lignitz: here is a Lutheran college; 12 miles N. of Lignitz. N. lat. $51^{\circ} 22'$. E. long. $16^{\circ} 15'$.

LUBENAU, or LUBNOW, a town of Lower Lusatia, in the circle of Calau, on a small river which runs into the Spree, the chief place of a barony with a chateau; 15 miles S.S.E. of Lubben. N. lat. $51^{\circ} 53'$. E. long. $13^{\circ} 52'$.

LUBERSAC, a town of France, in the department of the Correze, and chief place of a canton, in the district of Brives; 8 miles W. of Uzerche. The place contains 3087, and the canton 10,351 inhabitants, on a territory of $247\frac{1}{2}$ k. metres, in 12 communes.

LUBIEN, a town of the duchy of Warsaw; 26 miles S.S.W. of Posen.

LUBIENIETZKI, STANILAUS, in *Biography*, a celebrated Unitarian minister in the 17th century, was born at Racow in the year 1623. He was educated with great care, and his father introduced him in due time, to persons of respectability and consequence in the state. About the year 1648 he was admitted into the ministry by the synod of Czarcow, and appointed pastor of a church of that name. This situation he was obliged to quit in 1655, upon the irruption of the Swedes into that neighbourhood, and in the following year he retired with his family to Cracow. Here he employed much of his time with the other ministers, in frequent fasting, prayer, and preaching; and for the benefit of the Hungarian Unitarians, who came thither with prince Ragotzki, he frequently preached in the Latin language. While he continued at Cracow he was much noticed by the king of Sweden, who did him the honour

not admitting him to his table. After that city fell again into the hands of the Poles, in 1657, he followed the Swedish garrison, with two other Unitarians, to supplicate that they and friends of the same religious persuasion, who had placed themselves under his protection, might be comprehended in the amnesty to be granted at the conclusion of the peace with Poland. This was not granted, and finding that there was no hope of remaining in safety in his native country, he went to Copenhagen, in 1660, to seek an asylum from the king of Denmark for his persecuted brethren who had been banished from Poland. He received kind treatment from his majesty, who could do nothing more than promise to connive at their settlement at Altona. Thus circumstanced, he thought it advisable to return to Pomerania, and arrived at Stettin in 1661. Persecution followed him to this place, and he was obliged to remove to Hamburg, where he directed his family to join him in the year 1662: from this city he was driven by the same fiend in 1667, and took refuge again at Copenhagen. He now hoped there was a prospect of a peaceful settlement, because the magistrates of Fredericksburg consented that the Unitarians should reside in their town, and enjoy, without molestation, the private exercise of their religion. He therefore removed to that city, and invited his banished brethren to join him, sparing no pains nor cost, that he might settle and provide for them there. Scarcely, however, had they taken quiet possession of their new abodes, when they were banished from the city, and even the dominions of the prince to whom the city belonged. Lubienietzki was ill at the time when he received the order, but promised to obey it as speedily as possible. Before, however, he could be removed, poison was administered to him in his food, to which two of his daughters, as well as himself, fell sacrifices, while his wife, who had eaten very sparingly, narrowly escaped the same fate. He died in 1675, about the age of fifty-two. He wrote many books, the greater number of which was not printed. The principal published work was entitled "Theatrum Cometicum," in two vols. folio, which contains a minute historical account of every single comet which had been seen or recorded from the deluge to the year 1665. At the time of his death he was engaged in writing "A History of the Reformation in Poland," which was printed in Holland in 1685, in 8vo, with an account of the author's life.

LUBIN, AUGUSTINE, an able geographer in the seventeenth century, was born at Paris in the year 1624. He entered, at an early age, among the religious of the reformed order of St. Augustine, and was distinguished by his proficiency in literary pursuits, particularly in ancient and modern geography, and in sacred and profane history. He passed through all the offices of his order, and his scientific skill was rewarded with the post of geographer to the king. He died at Paris in 1695. His principal works are "Martyrologium Romanum, cum Tabulis Geographicis et notis Historicis;" "Tabulæ Sacræ Geographicæ, five Notitia Antiqua, mediæ Temporis, et nova, Nominum utriusque Testamenti ad Geographiam pertinentium;" being a kind of dictionary to all the places mentioned in the bible; "Geographical Tables;" "The History of Lapland," translated from Scheffer; "The Geographical Mercury," &c.

LUBIN, EILHARD, was born at Westerstede, in the county of Oldenburg, of which place his father was minister. He studied at several German universities, and acquired an exact knowledge of the Greek language, with the branches of science usually taught in those seminaries. He was appointed professor of poetry in the university of Rostock

in 1595, and ten years afterwards, was promoted to the professorship of divinity. He wrote notes on Anacreon, Juvenal, Persius, &c. His principal work was entitled "Phosphorus de Causa prima et Natura Mali," printed at Rostock in 1596. He died in 1621. Bayle.

LUBINIA, in *Botany*, was named by Commerçon, the French botanist, in honour of his friend the chevalier de St. Lubin, who distinguished himself formerly at the siege of Madras, and was, it seems, in the confidence of Hyder Ally. What pretensions the chevalier had to commemoration, as a votary of science, does not appear, nor was Commerçon very select in the distribution of such honours. Justieu, who must have seen specimens, passed over the plant and the name in silence. Lamarck referred it to *Lyfimachia*. Venten. Jard. de Celf. 96.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Lyfimachie*, Juss.

Gen. Ch. *Cal.* Perianth inferior, in five deep, ovate, rather unequal segments, with membranous edges, permanent. *Cor.* of one petal, nearly salver-shaped, slightly irregular; tube funnel-shaped, the length of the calyx; limb in five deep obtuse segments, the two lowermost rather the smallest. *Stam.* Filaments five, awl-shaped, inserted into the lower part of the corolla, equal, the length of the tube; anthers erect, oval, two-lobed. *Pist.* Germen superior, almost globular, smooth; style cylindrical, the length of the filaments, permanent; stigma simple, obtuse. *Peric.* Capsule roundish-oval, crowned by the style, with five notches at the top, of one cell, not bursting. *Seeds* numerous, roundish, compressed, rough. *Receptacle* central, ovate, somewhat compressed, unconnected with the capsule except at the base, from which it separates as the seeds ripen.

Eis. Ch. Corolla salver-shaped, irregular. Capsule ovate, not bursting, crowned with the style, of one cell. Seeds numerous, attached to a central receptacle.

1. *L. spatulata*. Vent. Jard. de Celf. t. 96. (*Lyfimachia mauritiana*; Lamarck Dict. v. 3. 372. Illustr. n. 1980.)—The only known species. Native of the isle de Bourbon. M. Cels appears to have had it in cultivation. The root is said by Ventenat to be biennial, and the flowers to be produced in the beginning of summer. This plant has something of the aspect of *Convolvulus tricolor*, but is firmer, and quite smooth. The woody stem produces a few simple branches, a span long, clothed with numerous, scattered, spatulate, obtuse, entire, rather fleshy leaves, above an inch long, tapering down into a bordered footstalk. Flowers axillary, solitary, on simple stalks, half as long as the leaves. Calyx dark brown, dotted with black, white at the edge. Corolla yellow, nearly as broad as that of *Lyfimachia nemorum*.—Capsule when pressed bursting irregularly, sometimes at the sides, sometimes, according to Ventenat, into two or four apparent valves. Lamarck says it has five valves, but he perhaps judged from the notches at the top. The fruit therefore, and the irregular corolla, mark this genus as sufficiently distinct from *Lyfimachia*; to which may be added, on the score of habit, its alternate, not opposite or whorled, leaves.

LUBISCHAW, in *Geography*, a town of Prussia, in the province of Pomerania; 18 miles S. of Dantzic.

LUBISCHMAT, a town of Prussia, in the palatinate of Culm; 5 miles E. of Thorn.

LUBLENIEZ, or LUBENSKA, a town of Silesia, in the principality of Oppeln; 29 miles E. of Oppeln. N. lat. 50° 39'. E. long. 18° 42'.

LUBLIN, a city of Poland, and capital of a palatinate of the same name; part of which is annexed to the new country of Galicia. It is surrounded with a wall and ditch, and though not very large, its castle, which is built on a high

high rock, is seated on the river Bystrza, in a pleasant and fertile country. This town contains many churches and convents; and in its suburbs are many Jews, who are accommodated with a spacious synagogue. It has three fairs in the year, one of which lasts a month; and they are frequented by German, Greek, Armenian, Arabian, Russian, Turkish, and other traders and merchants. The chief tribunal for Little Poland was formerly held here, together with a provincial diet and a court of judicature. Lublin is distant 85 miles S.E. of Warsaw. N. lat. 51° 6'. E. long. 22° 45'.

LUBNEKI, a town of Samogitia; 10 miles N. of Miedniki.

LUBNI, a town of Russia, in the government of Kiev, on the Sula; 8 miles E.S.E. of Kiev. N. lat. 50°. E. long. 32° 54'.

LUBOK, commonly called the *Bavian*, or *Baboon*, an island in the East Indian sea, not far from the coast of Java, not large, but extremely populous. Seventy or eighty vessels are continually passing to and fro between this island and the coasts of Java and Borneo.

LUBOLO, a province of Angola, in Africa, on the banks of the Coanza.

LUBOMLA, a town of Austrian Poland, in Galicia; 32 miles E. of Chelm.

LUBOZ, a town of Lithuania, in the palatinate of Novogrodek; 16 miles N.E. of Novogrodek.

LUBRONG, or TESHOO-LOOMBOO, a town of Tibet, and residence of Teshoo Lama, capital of that part of the country which is immediately subject to his authority, is situated in N. lat. 29° 4' 20", and E. long 89° 7'. This is a large monastery, consisting of three or four hundred houses, the habitations of the Gylongs, besides temples, mausoleums, and the palace of the sovereign pontiff; in which are comprehended also the residence of the regent, and the dwellings of all the subordinate officers, both ecclesiastical and civil, belonging to the court. It is included within the hollow face of a high rock, and has a southern aspect. Its buildings are all of stone, none less than two stories high, flat-roofed, and covered with a parapet, rising considerably above the roof, composed of heath and brushwood, inserted between frames of timber, which form a ledge below, and are fashioned above into a cornice, capped with masonry. All the houses have windows; that in the centre projecting beyond the walls, and forming a balcony: they are not closed with shutters, but black mohair curtains. The principal apartment in the upper story has an opening over it, covered with a moveable shed, which serves the purpose of sometimes admitting light and air, and in the winter season, occasionally, the grateful warmth of the sun. Turner's Tibet.

LUBUNGAN, a town on the north coast of the island of Mindanao.

LUBWACH, a town of Germany, in the bishopric of Bamberg; 8 miles N.E. of Bamberg.

LUBZ, or LUBITZ, a town of the duchy of Mecklenburg; 23 miles S.S.W. of Gullrow. N. lat. 53° 30'. E. long. 12°.

LUC EN DROIS, a town of France, in the department of the Drôme, and chief place of a canton, in the district of Die, seated on the Drôme; 9 miles S. of Die.

LUCALA, a town of Africa, in Angola, on a river of the same name, which runs into the Coanza; 30 miles N.E. of Malanganio.

LUCAN, in *Biography*, a celebrated Roman poet, was born at Corduba, in Spain, about the year 39 before the Christian era. His father, Annæus Mela, a Roman knight,

was the youngest brother of Seneca the philosopher; and his mother, Acilia, was daughter of Acilius Lucanus, an eminent orator. Lucan was brought to Rome during the first months of his infancy, and was committed, at a very early age, to the care of the ablest masters in grammar and rhetoric. He studied philosophy under the stoic Cornutus, from whom he derived the lofty and free strain of sentiment by which he is so much distinguished. It is said he completed his education at Athens. Seneca, then tutor to the emperor Nero, obtained for him the office of questor: he was soon after admitted to the college of augurs, and considered to be in the full career of honour and opulence. He gave proofs of poetical talents at a very early age, and acquired reputation by several compositions; a circumstance that excited the jealousy of the emperor, who valued himself on his powers as a poet and musician. Lucan even ventured to recite one of his own pieces, in competition with Nero; and, to the surprise of every one, the judges decided in favour of Lucan. From this period Nero regarded the poet with all the malignity of a vanquished rival, and made use of his power in forbidding him again to repeat any of his verses in public. In the conspiracy against the tyrannical emperor, Lucan took a part: the plot was discovered, and he was apprehended among the other conspirators. Tacitus and other authors have accused him of the pusillanimity of endeavouring to free himself from punishment, by accusing his own mother, and involving her in the crime of which he was guilty. Mr. Hayley has endeavoured to rescue his name from so terrible a charge, by observing and commenting on the fact, that the mother of Lucan was passed over without punishment: hence he inferred, that no evidence existed of her having been charged by her son, but popular rumour; because it is well known that no other person, however distantly implicated in the conspiracy, escaped without some kind of penalty. At any rate, his confessions were of no avail, and his mind recovered its firmness for the concluding scene. No favour was granted him but the choice of the death he would die; and he chose the same which had terminated the life of his uncle Seneca. His veins were accordingly opened; and when he found himself growing cold and faint through loss of blood, he repeated some of his own lines, describing a wounded soldier sinking in a similar manner: these were the last words which he uttered. He died in the year 65, and in the 27th year of his age. Of the various poems of Lucan, none but his *Pharsalia* remain, which is an account of the civil wars between Cæsar and Pompey, but is come down to us in an unfinished state. Its title to the name of an epic poem has been disputed by those critics, who, from the examples of Homer and Virgil, have maintained that machinery, or the intervention of supernatural agency, is essential to that species of composition. As to the merits of the poetry itself there are various opinions. Lucan certainly possesses neither the fire of Homer, nor the melodious numbers of Virgil. If he had lived to a maturer age, his judgment as well as his genius would have been improved, and he might have claimed a more exalted rank among the poets of the Augustan age. His expressions, however, are bold and animated; his poetry entertaining; and it has been asserted that he was never perused without the warmest emotions, by any whole minds were in unison with his own. The best edition of the *Pharsalia* is the Variorum, Leyd. B. 8vo., 1669. The editions by Oudendorp, 1728; by Burman, 1740; by Bentley, 1760; and by Barbois, 1767, are in good esteem. The *Pharsalia* has been translated into English verse by Mr. Nicholas Rowe. There was no Delphin edition of this poem,

poem, devoted to the interests of liberty; but it was one of the first pieces of ancient literature that was published during the French republic, by Didot, in a splendid folio.

LUCAN, in *Geography*, a village of the county of Dublin, Ireland, pleasantly situated on the banks of the Liffey. It is remarkable for a sulphureous medicinal spring, which is much frequented. It is $6\frac{1}{2}$ miles W. from Dublin.

LUCAN, *Al*, a town of Asiatic Turkey, in Aladulia; 15 miles E. of Marasch.

LUCANAS, a jurisdiction of the diocese of Guamanga, in the viceroyalty of Peru, commencing about 25 or 30 leagues S.W. of Guamanga. Its temperature is cool and moderate. The parts of the former breed large droves of all sorts of cattle; and those of the latter are fertile in grain, herbs, and fruits. It also abounds in valuable silver mines, in which the riches of Peru chiefly consist; and by these means it becomes the centre of a very extensive commerce; great numbers of merchants resorting thither with their goods, and others for purchasing such provisions as their own respective countries do not afford, for which they give in exchange ingots and pinnae of silver.

LUCANIA, in *Ancient Geography*, a province of Italy, bounded on the north by Campania and Apulia, on the east by Sinus Tarentinus, on the south by Brutium, and on the west by the Tusean sea. A ridge of the Apennines, running from north to south, divides this province into two parts.

LUCANUS, in *Natural History*, a genus of insects of the order coleoptera: antennae clavate, the club compressed and divided into short pectinate leaves; jaws projecting beyond the head, so as to resemble horns, toothed; two palpigerous tufts under the lip.

This genus differs chiefly from the **SCARABÆUS**, (to which the reader is referred,) in having the jaws considerably elongated, so as to give the appearance of a pair of denticulated horns; while the antennae terminate in a laterally flattened tip, divided on the interior side into several lamellæ. There are twenty-six species, of which four are British, which will be noticed by asterisks.

Species.

ALCES. Jaws exerted, four-toothed at the tip. It inhabits several parts of Asia. The head is large, depressed, black, sinuate on each side; jaws longer than the head, compressed at the tip, and armed with a strong tooth in the middle within.

GIRAFFA. Jaws exerted, depressed, with many different sized teeth; lip rounded. Inhabits Asia. The jaws are likewise very long; the teeth at both ends larger; thorax with an unequal margin; body black.

* **CERVUS**; Stag-beetle, or Stag-chaffer. Jaws exerted, forked at the tip; a small branch near the middle within. It is the largest of all the European coleopterous insects, sometimes measuring nearly two inches and a half in length, from the tip of the jaws to the end of the body. Its general colour is a deep chestnut, with the thorax and head, which is of a squarish form, of a blacker cast; and the jaws are often of a brighter or redder chestnut colour than the wing-shells; the legs and under-parts are coal-black; and the wings which, except during flight, are concealed under the shells, are large, and of a fine pale yellowish-brown. This remarkable insect is chiefly found in the neighbourhood of oak-trees, delighting in the sweet exudation, or honey-dew, frequently observed on the leaves. Its larva, which perfectly resembles that of the genuine beetles, is also found in the hollows of oak-trees; residing in the fine vegetable mould usually seen in such cavities, and feeding on the softer

parts of the decayed wood. It is of a very considerable size, of a pale yellowish or whitish-brown colour; and when stretched out at full length, measures nearly four inches. It has been supposed by Roefel, that these *larvæ* were the *coffi* of the ancient Romans, which, according to Pliny, were in high esteem as an article of luxury. What renders this supposition the more probable is, that the larvæ of a species of *cerambyx*, as well as of a *cureulio*, are well known to be greatly admired by the inhabitants of the West Indian islands, and are frequently collected at a great expence, as a highly delicate dish, being broiled or fried for that purpose. When arrived at its full size, which, according to some, is hardly sooner than the fifth or sixth year, it forms, by frequently turning itself, and moistening it with its glutinous saliva, a smooth oval hollow in the earth, in which it lies; and afterwards remaining perfectly still for the space of nearly a month, divests itself of its skin, and commences pupa or chrysalis. It is now of a shorter form than before, of a rather deeper colour, and exhibits, in a striking manner, the rudiments of the large extended jaws and broad head, so conspicuous in the perfect insect; the legs are also proportionably larger and longer than in the larva state. The ball of earth, in which this chrysalis is contained, is considerably larger than a hen's egg, and of a rough exterior surface, but perfectly smooth and polished within. The chrysalis lies about three months before it gives birth to the complete insect, which usually emerges in the months of July and August. The time, however, of this insect's growth and appearance in all its states varies much, according to the difference of seasons. It is not very uncommon in many parts of England.

The commonly supposed female differs so much in appearance from the male, that it has by some authors been considered as a distinct species. It is not only smaller than the former, but totally destitute of the long and large ramified jaws; instead of which it has a pair of very short curved ones, slightly denticulated on their inner side: the head is also of considerably smaller diameter than the thorax. In point of colour it resembles the former. Among those who consider it as a distinct species may be numbered the ingenious Mr. Martham, F.L.S., who, in his "*Entomologia Britannica*," assures us that the real female insect extremely resembles the male, but is smaller, and wants the larger denticulation on the inner side of each horn. The generally supposed female he distinguishes by the title of "*Lucanus inermis*."

SAIGA. Jaws exerted, many-toothed; lip abbreviated, emarginate. Inhabits America. Body depressed, smooth, black; jaws hardly forked at the end.

ELAPHUS. Jaws exerted, one-toothed, forked at the tip; lip deflected, conic; hind margin of the head much elevated, emarginate. Female less; the jaws not exerted. Inhabits Virginia.

CAPREOLUS. Jaws exerted, the middle denticles differently shaped, forked at the tip. Inhabits Germany. It is about half the size of the *cervus* above described; jaws with two thick approximate lobed denticles in the middle; body black.

DAMA. Jaws exerted, two-toothed within, as long as the head. Inhabits Virginia. A variety has jaws entire at the end; thighs ferruginous.

FEMORATUS. Jaws exerted, three-toothed; body black; thighs ferruginous. It inhabits Cayenne. The head is plain, almost without lip; thorax more dusky; the fore margin fulvous, ciliate; the hind margin two-toothed each side; scutell fulvous, silky.

BISON. Jaws exerted, many-toothed; thorax and shells edged with red. Inhabits America. Edge of the thorax rufous, with a black line.

GAZELLA. Jaws two-toothed within; body black; shells edged with testaceous. Inhabits Siam. The jaws are short; head with a small plate before the eyes; hind edge of the thorax notched on each side; flanks angular, grooved.

LAMA. Jaws exerted, three-toothed, shorter than the head; thorax angular. Inhabits India.

SETURALIS. Jaws exerted, three-toothed at the base within; body testaceous, with a dorsal black line; the head is testaceous, with a black margin and dorsal line, which is bifid at the tip; thorax testaceous, with a black dorsal line and spot each side at the base.

CABINATUS. Depressed; thorax unarmed, shorter than the head, the hinder angles excavated; abdomen very short; breast ending behind in an acute angle. Inhabits India.

* **PARALLELEPIPEDUS.** Jaws with a lateral elevated tooth within; body depressed. It inhabits Europe. Body black, very small; female with a double prominent dot on the head.

TENEROIDES. Jaws lunate, one-toothed; body black; thorax margined; shells subfriate. Inhabits Russia. Abdomen pitchy.

CACEROIDES. Jaws incurved, with a thick differently shaped tooth within, shells punctured, slightly downy; thorax a little grooved; flanks ferrate. It inhabits Van Diemen's land.

* **CARABOIDES.** Bluish; jaws lunate; thorax margined; varies in being greenish, with reddish legs and abdomen. Inhabits Europe.

PICUS. Black, smooth, friate; antennæ, abdomen, and legs pitchy. Inhabits Sweden.

CAPENSIS. Excuteallate, black; body depressed; thorax friate. Found in Chili, South America.

PILMUS. Excuteallate, black; shells with punctured grooves. Inhabits the Cape.

TARANDUS. Scutellate, black, very smooth; jaws exerted, three-toothed at the tip, two-toothed on the inner side. Inhabits Africa.

ANTILOPE. Jaws exerted, edged on the inner side, the upper margin two-toothed, but the lower five-toothed; body brown, nearly smooth. Found in different parts of Africa.

BUBALUS. Black; jaws bifid; one part projecting, sub-lunate, three-toothed within; the other larger, deflected, arched entire. Inhabits Georgia.

INTERRUPTUS. Antennæ arched; body black, with a recumbent spine on the crown; thorax and abdomen remote; thorax and shells ciliate, with rufous. Inhabits America and the West India islands, under rotten sugar-canes. This is the *pallalus interruptus* of Fabricius.

DENTATUS. Antennæ arched; head many-toothed; thorax punctured at the sides; thorax and abdomen remote. Found in the island of Guadeloupe. This is the *pallalus dentatus* of Fabricius.

MINUTUS. Antennæ arched; thorax and abdomen remote, ferruginous; shells testaceous. This is the *pallalus minutus* of Fabricius, and is found in the South American islands. The body is much depressed, hardly larger than a louse; jaws exerted, short, unarmed, pointed; shells hardly friate.

Dr. Shaw mentions a highly elegant species, that has lately been discovered in New Holland, which differs from the rest in being entirely of a beautiful golden green colour, with short, sharp-pointed, denticulated jaws of a brilliant

copper colour. The whole length of the insect is rather more than an inch. Gmelin's *Linn.* Shaw's *Zoology*. Donovan.

LUCAR, among the Romans, an application given to the money expended upon plays and public shows.

LUCAR de Barrameda, St. in *Geography*, a decayed seaport town of Spain, in the province of Seville, at the mouth of the Guadalquivir, the key of Seville, with a good harbour, but difficult of access on account of a rock in the water. A whole fleet may lie securely in the road. The chief article of its trade is salt; 13 miles N. of Cadiz. N. lat. 36° 45'. W. long. 6° 27'.

LUCAR de Guadiana, St. a town of Spain, in the province of Seville, situated on the Guadiana, on the confines of Portugal, and defended by towers and battions. The tide flows up to the town, so as to bring small vessels into its harbour; 64 miles W. of Seville. N. lat. 37° 35'. W. long. 7° 25'.

LUCAR le Mayor, St. a town of Spain, in the province of Seville, on the Guadiana; 10 miles W. of Seville.

LUCARIA, an ancient feast celebrated by the Romans. Sext. Pompeius observes, that the *lucaria* were solemnized in the woods, where the Romans, defeated and pursued by the Gauls, retired, and concealed themselves. The word, according to Festus and Sext. Pompeius, comes from *lucus*, a grove or wood. Varro derives it from *lucē*, the ablative of the word *lux*, light and liberty. But the former etymology seems the more natural.

It was held in the month of July, in memory of the asylum they found in the wood, which was between the Tyber and the road called Via Salaria.

LUCAS, TUDENSIS, in *Biography*, a Spanish writer and prelate, who flourished in the thirteenth century, was first a deacon in the church, and afterwards bishop of Tuy, a city of Galicia, whence he has his surname. He travelled into several parts of the east and other countries, for the purpose of obtaining information concerning the religion and ceremonies of different nations; and was raised to his bishopric by pope Gregory IX. His principal work was "A Treatise against the Albigenes." He was author, likewise, of "The Life of St. Isidore of Seville;" and he made considerable additions to "The Chronicle of St. Isidore." Gen. Biog.

LUCAS, FRANCIS, a learned divine, who flourished in the seventeenth century, was a native of Bruges, was educated at Louvain, attained to the degree of doctor, and was made dean of the church of St. Omer's. He died in 1619. He was profoundly skilled in the Greek, and in all the oriental languages; and was an expert judicious critic. He was the author of "Notationes in sacra Biblia, quibus variantia discrepantibus Locis, Exemplaribus suarum Studio discutuntur," 4to. 1580; "Commentaria in Evangel." in 5 vols., folio; "Nota ad varias Lectiones in Evangel.;" "Concordantie Latinarum Bibliorum Vulgata Editionis," and of many other learned works.

LUCAS, PAUL, a celebrated traveller, was born at Rouen in 1664. He felt an early inclination to travel into foreign countries, which he gratified by several tours through the Levant, Egypt, Turkey, and other parts. He brought back a rich treasure of medals and other curiosities for the king's cabinet, who ordered him to draw up an account of his travels, and who, in 1714, nominated him one of his antiquaries. He was afterwards employed by the dukes of Burgundy. In 1723 he took another voyage to the Levant, by order of Lewis XV., and collected many curious and valuable manuscripts and medals. From this period to 1736 he lived a life of repose: but in the last

named year he visited Spain, a country which he had never before seen, and was well received by the king, who engaged him to arrange his cabinet of medals: but during this employment he was taken ill, and died in 1737, at the age of seventy-two. He was author of a work, entitled, "Travels of Paul Lucas," in seven volumes. In four of them is an account of his voyage to the Levant, to Greece, Asia Minor, Macedonia, and Africa. His travels in Turkey, Asia, Syria, Palestine, and Egypt, were published at Rouen, in three volumes.

LUCAS, RICHARD, a native of Wales, was born at Presteigne, in Radnorshire, in the year 1648; and when he had laid a good foundation in grammar learning, he was sent to the university of Oxford, and entered a student at Jesus college in 1664. He took his degree of arts in 1668, and in 1672; and was some time master of the free-school at Abergavenny, in Monmouthshire. From this place he removed to London, and obtained the vicarage of St. Stephen's, Coleman-street, and became lecturer of St. Olaves, Southwark, in 1683. In 1691 he took his degree of doctor of divinity, and was installed prebendary of Westminster in 1696. Soon after this, an infirmity which he had experienced in his eyes, from his youth, deprived him totally of his sight. He died in 1715, at the age of sixty-seven, and was buried in Westminster Abbey. He was highly valued by his contemporaries for his piety and learning; and his writings have transmitted his name with honour to posterity. Of these the most important is his "Inquiry after Happiness," in two volumes, 8vo., which has gone through many editions. It is remarkable that it was composed by the author, after he had lost his sight, and was rendered incapable of public services. His other works are "Practical Christianity," and "The Morality of the Gospel;" "A Guide to Heaven;" "Five Volumes of Sermons," and some smaller pieces. He translated into the Latin language "The whole Duty of Man," which was printed in 1680. Biog. Brit.

LUCAS, *St.*, in *Geography*, a town of Mexico, in the province of Guatemala; 12 miles E. of Guatemala.—Also, a small island near the coast of Mexico, in Salinas bay. N. lat. 10° 15'. W. long. 85° 22'.

LUCAU, or LUCCA, in *Geography*, a town of Saxony, in the principality of Altenburg; 8 miles N.N.W. of Altenburg. N. lat. 51° 6'. E. long. 12° 18'.—Also, a town of the duchy of Carinthia, near the Gail; 32 miles E. of Brixen.

LUCAYA ISLANDS. See BAHAMA.

LUCAYO, one of the Bahama islands; 20 miles long, and five broad. N. lat. 27° 25'. W. long. 78°.

LUCAYONEQUE, one of the Bahama islands; 75 miles long, and five or six broad, but of an irregular form. N. lat. 27°. W. long. 77° 0'.

LUCCA, a small republic of Italy, on the coast of the Tuscan sea, in N. lat. 43° 50'. It is bounded N. by the late duchy of Modena; on the S.W. by the Mediterranean; and every where else by Etruria. It is computed to be upwards of 35 miles in length, and from 15 to 20 in breadth, and to contain 288 square miles, and within its extent one city, 150 villages, and 120,000 inhabitants, of whom, it is said, that from 20,000 to 30,000 are able, on occasion, to bear arms. The Luccese are the most industrious people of Italy, and no spot of ground is left uncultivated; the hills being covered with vines, olives, chestnut, and mulberry trees, while the meadows near the coast nourish numerous cattle; but the country does not produce corn sufficient for the consumption of its inhabitants. Oil and silk are the chief exports of Lucca, and their motto is LIBERTAS. a

goddeffs, rarely found more amiable than here. Lucca was anciently a Roman colony; when the Lombards overran Italy, it became tributary to them; afterwards it was annexed to the dominion of the Franks, and from them the emperors of Germany claimed its sovereignty. In the reign of Charles IV. it became an independent state, and has, during three centuries, maintained its liberty, under the protection of some foreign power. In the recent revolutions of Italy, this state adopted a constitution similar to the French; and it is now a principality, with the addition of Massa Carrara, and Garfagnana.

LUCCA, the capital of the fore-mentioned principality, and the residence of the government, is delightfully situated in a plain, terminated by eminences, and diversified with villages, feats, summer-houses, vineyards, meadows, and corn-fields. This city is regularly fortified with eleven bastions; its circuit is about a league; it is well-built, and the streets, though irregular, are broad and well paved. Situated near the river Serchio, 12 miles N.E. of Pisa, it contains a state-palace, within which is a large arsenal, a Gothic cathedral, with a richly furnished chapel, 25 churches, 40 convents, and about 40,000 inhabitants; among whom are many artists and manufacturers, especially in silk and gold, and silver stuffs. The bishop holds immediately of the pope, and is entitled to the pallium, or crucifix, as an archbishop. In the cathedral is a *volò fanto*, or wooden crucifix, to which a peculiar veneration is paid. In the year 1799, the French entered this city, and imposed upon it a contribution of 2,000,000 livres. They seem to have taken it under their protection, and to allow it its freedom. N. lat. 43° 54'. E. long. 10° 34'.

LUCCA, a river of Asia, which rises in Persia, and runs into the Indus, about 18 miles above the conflux with the Chunaub.

LUCCHESI, ANDREA, in *Biography*, a native of Venice, and maestro di cappella, in 1772, to the elector of Cologne. A pleasing composer, whose motets were frequently sung by Manfili, and other great singers in the churches of Italy, and whose symphonies were much esteemed, even in Germany, where they have been brought to the greatest perfection. In 1767, he composed a cantata for a grand festival given to the duke of Wirtemberg at Venice.

LUCCI, in *Geography*, a town of Naples, in Calabria Citra; 3 miles S. of Bagnano.

LUCCOS, a river of Morocco, anciently called *Lixos*, which runs into the Atlantic at Laracha.

LUCE, *St.*, a cluster of small islands in the Indian sea, near the east coast of Madagascar. S. lat. 24° 30'. E. long. 47° 40'.

LUCE, *Eau de*. See *Eau de Luce*.

LUCEA, in *Geography*, a bay or harbour, on the N. side of the island of Jamaica, into which run two rivers, called East and West Lucea; 14 miles W. of Montego bay. N. lat. 18° 28'. W. long. 78° 9'.

LUCENA, a town of Spain, in the province of Cordova, in which are ten convents; 29 miles S.S.E. of Cordova. N. lat. 37° 32'. W. long. 4° 29'.—Also, a town of Spain, in Valencia; 18 miles N.E. of Segorbe.

LUCENAY L'ÉVEQUE, a town of France, in the department of the Saône and Loire, and chief place of a canton, in the district of Autun; 7 miles N. of Autun. The place contains 804, and the canton 9163 inhabitants, on a territory of 250 kilometres, in 12 communes. N. lat. 47° 5'. E. long. 4° 20'.

LUCERA, an ancient, inconsiderable, manufacturing town of Naples, capital of the province of Capitanata, and see of a bishop, suffragan of Benevento; containing four

four churches and nine monasteries, and pleasantly situated on an eminence in a plain, near the middle of the province, about 75 miles N.E. of Naples. The jurisdiction of the province is held here, and the manufacture is cloth. N. lat. $41^{\circ} 28'$. E. long. $15^{\circ} 16'$.—Also, a town of Naples, in Calabria Citra; 7 miles S. of Cosenza.

LUCERIUS, in *Mythology*, a name given to Jupiter, as *Luceria* was given to Juno, as the deities which gave light to the world.

LUCERN, in *Geography*, a canton of Switzerland, bounded on the W. and N. by Bern, on the E. by Zurich and Schweitz, on the S. by Underwalden and Bern, lying in N. lat. $47^{\circ} 10'$; being from 30 to 50 miles from N. to S., and from 25 to 30 in breadth, and containing 100,000 inhabitants, who are chiefly employed in agriculture. The southern parts of this canton are chiefly mountainous, and furnish for exportation cattle, hides, cheese, and butter. The northern district is fruitful in corn, which, being more than sufficient for the consumption of the canton, allows of a constant exportation from the weekly market held in the town, to which the inhabitants of the small canton resort for the purchase of that and of other necessaries. This commerce, together with the passage of the merchandize for Italy, is the chief support of the town, and might be much improved and augmented, considering its advantageous situation; for the Reufs issues from the lake, passes through the town, and, having joined the Aar, falls into the Rhine.

Lucern, originally subject to the house of Austria, was exposed to the inroads of Uri, Schweitz, and Underwalden, when these cantons had seized their independence. Her commerce to Italy was interrupted; her fairs unfrequented; and her citizens compelled to be continually under arms, in order to protect their territory from incessant depredations. Under these circumstances, the Austrians loading the citizens with exorbitant taxes, Lucern made her peace with the confederate cantons; and, expelling the Austrian party, entered into a perpetual alliance with Uri, Schweitz, and Underwalden, and became a member of the Helvetic union. The accession of Lucern gave additional credit and power to the confederacy, and enabled it to resist all the efforts of a great and implacable enemy. In 1386, Leopold, duke of Austria, invaded the canton with a numerous army; when the combined troops gained a bloody victory at Sempach, in which Leopold lost his life.

The government of Lucern was entirely aristocratical, or rather oligarchical. The sovereign power resided in the council of 100, comprising the senate, or little council. The great council was the nominal sovereign; but the whole power actually resided in the senate, consisting of 36 members, who were formed into two divisions, exercising the office by rotation. The administration of the current affairs, the care of the police, the management of the finances, and the whole executive power, resided in the senate, which sat constantly; whereas the sovereign council was assembled only upon important occasions. The senate had cognizance of criminal causes; but in case of capital condemnation the sovereign council was convoked, in order to pronounce the sentence. In civil causes, an appeal lay from the senate to the sovereign council, which, in reality, was a matter of mere form, as it was an appeal from the senators in one court, to the same senators in another. The influence of the senate over the sovereign council was absolute; for they constituted above a third of that body, chose their own members, conferred the principal charges of government, and nominated to the ecclesiastical benefices, which are considerable; nearly two-thirds of the revenue of the canton belonging to the clergy. From a view of this constitution, it appears, that

when the spirit of the constitution is oligarchical, all laws enacted for the purpose of counteracting the power of the nobles are mere cyphers. However, in some instances, the authority of the nobles is controlled; for, in declaring war and peace, forming new alliances, or imposing taxes, the citizens were to be assembled, and to give their consent. Lucern, being the first in rank and power among the Catholic cantons, was the residence of the pope's nuncio, and all affairs relating to religion were decided in the annual diet, which assembled in the town, and which was composed of the deputies of those cantons.

Lucern, though an oligarchical state, manifested, at the time of the French revolution, an aversion from all innovation. The people appeared to be satisfied with their government, and resisted all attempts to effect a change. During the progress of the revolution, Lucern acted with great spirit, and was inclined to join in defence of her own independence, as well as in support of the Helvetic union. Even after the surrender of Bern and the desertion of Zurich, a numerous body of peasants demanded the re-establishment of the ancient government, and joined the troops of the small cantons to resist the entrance of the French; and the whole canton did not acquiesce without much opposition and bloodshed. At length a corps of French, after a short investment, entered the town of Lucern, and reduced the people to unconditional submission. Soon after this event, Lucern became the seat of the new Helvetic government. According to the constitution of the 29th of May, 1801, Lucern was one of the 17 departments, or cantons, into which Switzerland was divided: it retained its former extent and deputed five representatives to the diet. Near the town of Lucern is mount "Pilate," formerly called *Mons Pileatus*, from the Latin word *pila*, because its top is generally covered with a cloud or cap. This word has been corrupted into "Pilatus," whence some have ridiculously contended that Pontius Pilate, after having condemned our Saviour to death, was seized with remorse, made an excursion into Switzerland, and drowned himself in a lake at the top of the mountain. At the elevation of 5000 feet, and in the most perpendicular part of this mountain, near the pasture of Brumlen, is observed, in the middle of a cavern hollowed in a black rock, a colossal statue, which appears to be of white stone. It is the figure of a man in drapery, leaning one elbow on a pedestal, with one leg crossed over the other, and so regularly formed, that it can scarcely be a *lusus naturæ*. This statue is called "Dominic" by the peasants, who frequently accost it from the only place in which it can be seen, and when their voices are re-echoed from the cavern, they say, in the simplicity of their hearts, "Dominic has answered us." It is difficult to imagine by whom, or in what manner, this statue could be placed in a situation which has hitherto proved inaccessible to all who have endeavoured to approach it. This is, perhaps, one of the highest mountains in Switzerland, if estimated from its base, and not from the level of the sea; its elevation above the lake being more than 6000 feet. Soon after the French took possession of Lucern, general Brune erected, with great solemnity, the standard of liberty on the top of mount Pilate; thus, as Coxé says, conferring on the Swiss the shadow, while he deprived them of the substance of freedom. Coxé's Switzerland, vol. 1.

LUCERN, the capital of the above-described canton, a small, tolerably built, walled, trading town, containing about 3300 inhabitants, and agreeably situated on a plain almost environed by hills, at the efflux of the Reufs from the lake of Lucern, and at the N.W. extremity of the lake; 50 miles S.W. of Zurich, and 40 N. of Bern. The cathedral

and Jesuits' church are the only public buildings worthy of notice; but they are overloaded with rich ornaments, and disgraced by bad paintings. In the cathedral is an organ of fine tone, and extraordinary size; the centre pipe is 40 feet long, near three in diameter, and weighs 1100 pounds. The bridges which skirt the town, round the edge of the lake, are the fashionable walks of the place, and remarkable for their length; being covered at the top, and open at the sides, they afford a constant view of the delightful and romantic country; they are decorated with coarse paintings, representing the histories of the Old Testament, the battles of the Swiss, and the dance of Death. In the Wallerthurm tower, the treasure of the republic is deposited. The arsenal is well furnished with arms. This place is a thoroughfare from Italy by mount St. Gothard; but it has no manufactures of consequence, and little commerce. Of late the principles of toleration have been better understood and more widely diffused than they were formerly, and a literary society has been established for the promotion of polite learning. The lake is bounded towards the town of Lucern by cultivated hills sloping gradually to the water, contrasted on the opposite side by an enormous mass of barren and craggy rocks. N. lat. 46° 56'. E. long. 8° 6'. See the preceding article.

LUCERN, *Lake of*, called the Waldstätter see, or lake of the four cantons, consists of several branches and gulfs, distinguished by particular names, and affording variety of fine scenery. See LAKE.

LUCERN, in *Botany*. See MEDICAGO.

LUCERN, in *Agriculture*, a plant of the artificial grass kind, chiefly cultivated as a green food for cattle, and which affords a larger produce than most other sorts in proportion to the extent of land. It is known among botanists by the name of *medicago falcata*, and is the *alfalfa* of the Spaniards, and the *grand trèfle* of the French. It has a perennial root, and an annual stalk, which rises full three feet high in good land, and is furnished at each point with trifoliate leaves, the lobes of which are spear-shaped, about an inch and a half long, and half an inch broad, sawed towards the stalks. The flowers grow in spikes, which are from two to near three inches in length, standing upon naked footstalks two inches long, rising from the wings of the stalks: they are of the pea-bloom, or butterfly kind, of a fine purple colour, and are succeeded by compressed moon-shaped pods, which contain several kidney-shaped seeds. It flowers in June, and its seed ripens in September.

There are several varieties of lucern, as those with violet-coloured flowers, with yellow flowers, with yellow and violet flowers mixed, and with variegated flowers: but the editor of Mr. Miller's Dictionary observes, that they are only variations of the same plant, arising accidentally from the seed. However, neither the yellow nor the variegated flowered lucern is ever so strong as that with purple flowers; and cannot of course be so profitable to the cultivator.

It may be remarked, that Columella esteemed this plant as the choicest of all fodder, because it lasted many years, and bore being cut down four, five, or six times a year. In his opinion it enriched the land on which it grew, fattened the cattle fed with it, and was often a remedy for sick cattle. About three-quarters of an acre of it is, it is supposed, abundantly sufficient to feed three horses during the whole year. But though it was so much esteemed by the ancients, and has been long cultivated to advantage in France and Switzerland, it has yet found no great reception in this country, though it will succeed here as well as in either of

the above countries, being extremely hardy, and capable of resisting the cold of our climate.

In the Synopsis of Husbandry, it is noticed, that it is not till within these thirty years that this grass has been much in repute with the farmer, though it was known in England long before that time: but the cultivation of it was chiefly confined to gentlemen who raised it on their own demesnes; for the husbandmen, being well convinced of the extraordinary care required to prepare the land for the growth of it, were deterred from embarking in a business which seemed to be attended with much expence, and contented themselves with raising green fodder from their tares and clover, leaving the cultivation of this useful grass to their landlords, who could better spare the money for that purpose. But now that its virtues are better known, and the method of raising it more perfectly understood, there are few farmers, who do not choose to sow some acres of it, to supply their horses with a wholesome and lasting feed throughout the summer. The seed is of a paler cast than that of clover, and rather larger in size. It is annually provided from Holland by the seedsmen, and sold at different prices, from one to two shillings or more *per* pound, according to circumstances.

Soil—In respect to the soils that are most suitable to the culture of this plant, they are all those of the more deep, rich, and dry kinds, as those of the sound, mellow, loamy, and sandy descriptions; but on such as are retentive of moisture, it should not be attempted, as the roots of the plants are liable to be greatly injured, if not wholly destroyed, by the stagnation of water about them. Weeping gravelly lands, and all such as are not well drained, are of course improper for this sort of culture. Mr. Young suggests, that “the soils that suit lucern, are all those that are at once dry and rich. If they possess these two criteria, there is no fear but they will produce large crops of lucern. A friable deep sandy loam or chalk, or white dry marly bottom, is excellent for it. Deep putrid sands, warp on a dry basis, good sandy loam on chalk, dry marle or gravel, all do well: and, in a word, all soils that are good enough for wheat, and dry enough for turnips to be fed on the land, do well for lucern. If deficient in fertility, they may be made up by manuring, but he never yet met with any land too rich for it.”

Preparation.—The author of the System of Agriculture remarks, that “in the preparation of the land, the soil should be always brought into as fine a condition of mould as possible. This may be effected by repeated ploughing and harrowing, and the previous growth of such sorts of crops of the green kind as have a tendency to clean and render the land more fine and mellow.” In this intention Mr. Young advises the taking of two crops of turnips, carrots, or cabbages, either in succession, or alternating with each other, the turnips in the heavier loams being eaten off upon the land in the second autumn before it is ploughed up. In either of these cases, from the hoeing and constant culture which is necessary while the crops are upon the land, it will be left in a suitable state of cleanness and friability. “Others recommend following as a better practice, the root weeds of every kind being carefully picked out in the different ploughings and harrowings. From the great length of time the ground must remain unemployed in this mode of preparation, it is probably only capable of being practised with advantage where the lands are heavy and very full of weeds.” But whatever mode is employed, the land must be rendered perfectly clean before this sort of crop is ventured upon it.

And it is requisite, that before the seed is put in, the mould

mould should be rendered perfectly fine by ploughing it over as frequently as may be necessary, and breaking it well down by occasional harrowing. It will seldom be necessary to make use of manure; but where the land is found to stand in need of it, the application is best made with the first of the green crops. The object to be constantly kept in view in this business, is chiefly that of rendering the land perfectly clean from weeds, and at the same time highly mellow and friable.

Nature and Quantity of Seed.—As feedmen are apt to keep their seeds from year to year, it may be necessary to apprise the farmer, that that which is perfectly fresh, is the most proper for being sown, as most small seeds vegetate in the most perfect manner when new.

And with respect to the quantity of seed, Dr. Dickson has stated that the proportion that is necessary, is variable according to the nature of the land, and the manner in which the crop is cultivated. In the broad-cast method, from eighteen to twenty pounds may be proper, while in that of the drill, it will be considerably less, according to the distances at which the operation is performed. In two feet equidistant rows, the usual allowance is about six pounds; in those of eighteen inches about eight pounds; in those of twelve inches, ten or twelve pounds; and in nine-inch rows, sixteen or eighteen pounds may be necessary, though Mr. Young only recommends from twelve to fifteen pounds for the acre.

Time and Manner of Sowing.—In his system of agriculture, the same writer states, that “the most proper season for putting this sort of crop into the ground, is as early as can be done in the spring months, as in this way the plants may be fully established before the season becomes too hot. The latter end of March, for the more southern districts, may be the most proper period; and the beginning of the following month for those of the north. When sown late there is more danger of the plants being destroyed by the fly, as has been observed by Mr. Tull. If the plants be intended to be transplanted out in the garden method, it will also be the best practice to sow the seed, as early in the spring as the frosts will admit, in order that the plants may be strong, and fit to set out about the beginning of August.”

In regard to the mode of sowing or putting in the crop, this writer also suggests, that “it should vary with the circumstances of the soil, and the mode of after-management that can be adopted with the most convenience. Where much attention cannot be bestowed on the business of hoeing and keeping the crop clean, the best method is that of sowing the land broad-cast; though in this method the crop may not last so long in the ground. But in cases where the crops are capable of being kept in a sufficiently clean condition by repeated hoe-culture, the drill may be more advisable, particularly in narrow distances. The practice of transplanting can, perhaps, only be done in particular cases, on small pieces of deep land that are in great heart, and require the plants in consequence to stand thin and regular upon the ground, as in these modes they become large and of vigorous growth. In soils that are inclined to moisture at some depth below the surface, it may be a useful method of keeping the roots of the plants from being injured by their penetrating too deeply, as is more the case when the plants rise from seed. The seed may be sown either alone or with grain crops, in the same manner as clover; each method has its advocates, and it is probable that they may be useful under different circumstances, as in the deeper and more fertile sorts of land the first may be the most beneficial method, and in those of the lighter and less deep kinds the latter; as in the deep sorts of land there may be less loss of time in pro-

curing the green produce for hawks or other sorts of stock, as well as a greater certainty of the crop succeeding. But in the lighter and more porous soils, by being sown with corn, the plants may be better protected in their early growth, as well by the shade as the moisture that will, in that way, be preserved. Some indeed speak of its superior utility on the ground of long experience, in its being better preserved from the fly. Wherever this mode is made use of, the grain should, however, be sown thinner than is usually the case, in proportion as the soils are more rich. Oats are preferable to barley for the purpose, as being less liable to lodge, especially when sown thin. From five or six pecks to three bushels, sown as evenly as possible, may be the best proportions, the smaller quantity being necessary on the richest soils.” Mr. Young remarks, that “the greatest success by far that has been known is by the broad-cast method, which is nearly universal among the best lucern farmers, even among men who admire and practise the drill husbandry in many other articles. But as they mostly (not all) depend on severe harrowing for keeping their crops clean, which is a troublesome and expensive operation, he still ventures to recommend drilling, but very different drilling from that which has been almost universally practised, viz. at distances of eighteen inches or two feet. Objections to these wide intervals are numerous. If kept clean good, the lucern licks up so much dirt, being beaten to the earth by rain. See, that it is unwholesome, and the plant spreads into large spaces that it must be reaped, which is a great increase of expense. For these reasons, as well as for superiority of crop, he recommends drilling at nine inches, which, in point of produce, mowing, and freedom from dirt, is the same as broad-cast; and another advantage is, that it admits a scaring once a year, which is much more powerful and effective than any harrowing. These facts are sufficient to weigh so much with any reasonable man, as to induce him to adopt this mode of drilling, as nearer to broad-cast by far than it is to drills at eighteen or twenty four inches, which open to a quite different system, and a set of very different evils. Nine-inch rows might *practically*, but not literally, be considered as broad-cast, but with the power of rearing.” And in regard to “the material point, of with or without corn, two considerations present themselves. One is, the extreme liability of lucern to be eaten by the fly, which does great mischief to many crops, when very young, and against which the growing corn is some protection. The value of the barley or oats is another object, and not to be forgotten. It is also gained in the first year’s growth of the lucern, which is very poorly productive, even if no corn be sown, so that he must own himself clearly an advocate for drilling it among corn, either between the rows of nine-inch barley, or across drilled barley at a foot; perhaps the latter is the best method, as there is less probability of the crop being laid, to damage the lucern. The quantity of food-corn should also be small, proportioned to the richness of the land; from one bushel to a bushel and a half, according to the fertility of the soil; and also taken against the mischief of *lodging*. If these precautions are taken, it would be presumptuous to say that the risk of the fly, &c. being always, and in all things, in our hands, the contrary may prove bad, the fly may eat, and drought prevent vegetation, but, in rich circumstances, the farmer may rest satisfied that he has done what can be done; and if he does succeed, the advantage will be unquestionable.”

In the broad-cast mode, in every case, as soon as possible after the grain has been sown and harrowed properly in, the lucern seed should be immediately put in in that mode, by a regular even cast over the fine surface, covering it with a light

light feed-harrow, but it should not be too deeply covered in, two inches being fully sufficient. In the drill method, the same system should be followed, the lucern seed being drilled in immediately after the corn has been put into the soil.

It need hardly be noticed that the plats of ground sown for the purpose of raising plants, to be set out in the garden method of culture, should always be without grain, or other sorts of crops, in order that they may admit of having the plants properly thinned out and kept clean, and in a vigorous state of growth, for being set out with the most advantage and success possible.

With regard to the proper distance of the rows, it may in addition be observed, where the drill mode of culture is practised, it should probably depend upon the state and circumstances of the soils. Mr. Kent advises two feet as the best distance in all cases; while others think equal distances of a foot in rich soils, such as are worth from thirty to forty shillings the acre, and nine inches in those that are of inferior fertility, as from fifteen to twenty shillings the acre, the best general distances. On soils of less value it is probable that this culture can seldom be had recourse to with much benefit to the farmer. The last distance approaches much to the broad-cast method, which is contended by some as the most appropriate in almost all cases, and of course it may be preferable, as it admits of being plowed between by a suitable plough, in the room of the harrowed method, and the observations made above are decidedly in favour of the method.

In whatever method this sort of seed may have been sown, it is, when good, quick in its vegetation, beginning to sprout in the course of a week, and soon spreading the plants over the surface of the land. And the sooner it obtains its rough leaf the better, as it is then like turnip-plants, out of danger of being destroyed by the fly. But before these plants arrive at this state of growth, they are liable, especially in dry seasons, to be much injured, if not wholly consumed, by the ravages of the same sort of insect as that which is so detrimental to the turnip crops. "Where the greatest part of the plants are injured in this way, the author of *Practical Agriculture* thinks it is probably the best method, when the crop has been put in alone, to plow up the land, and sow it down again with fresh seed, as soon as possible." And this he supposes "is an advantage which the sowing the crop alone has over that of putting it in with those of other kinds."

After Culture.—It may be stated in regard to the after-management of this grass, that, as the economy of the plant is such as to render it incapable of being grown with much advantage, where other sorts of plants, whether of the grass or weed kind, are apt to annoy it; much care and attention should of course be employed in keeping it clean and free from the intrusion of all such vegetable productions. This, the same author thinks, "may be effected in different ways, according to the methods in which the crop has been raised. Where the broad-cast plan has been pursued, little is necessary, where the land has been properly prepared after the grain crop has been removed, except keeping all sorts of heavy stock from coming upon it. In a dry season, if there be occasion, the field may however be fed a little by calves, and other very light stock, but they should never be kept long upon the plants at one time. When the second cutting has been made in the following year, if any grass shows itself the land should be harrowed over in a moderate manner, by a harrow which is not too heavy nor too long in the tines, two or more times, as may be necessary in different directions, the grassy matter being collected by a small light implement of the same kind, and removed from the land.

This business should be executed as soon in the early part of the spring as the nature and state of the ground will admit, as dry a period as possible being taken for performing the work. In the succeeding years two such harrowings may be frequently required, one in the early part of the spring season, and the other in the close of summer. In these cases, especially where there is much grass appearing, a much heavier sort of harrow should be made use of. In the 25th vol. of the *Annals of Agriculture*, one is advised of such a weight, as is sufficient for four horses, and which does not spread more than four or five feet; but in on cases, especially where the work is so frequently performed, one that requires less draught may be adequate to the purpose, as where such large heavy harrows are employed, there is much danger in injuring the crowns of the plants, and thereby causing their destruction; whereas by the use of the lighter ones, they are mostly much benefited from the mould being stirred about their roots. After these operations, as in the above case, the weeds should be brought together, and removed from the ground. When the crops are thin and patchy, seed in proportion to the deficiencies should be sown over such places before the harrowings commence each time. In every case the roller should be applied immediately after the operation has been performed, not only for the purpose of compressing the mould about the roots of the plants, but to render the surface perfectly level and fit for the scythe. In this method of culture, "where the produce is not to some extent, it is probably better to feed the crop by light cattle-stock in the autumn than mow it."

In respect to the drill-sown lucern, it is recommended, "where the rows are sufficiently evident, in the autumn season, after the grain has been secured, that a small shill should be passed between them, in order to extirpate all the weeds and grassy materials, as well as to loosen the mould about the roots of the plants, and that they may be rendered more perfectly clean, the hand-hoeing of the plants in the rows: and that, in the succeeding year, still more particular attention to the use of the shill and hoe will be requisite. The business should be begun as early as the state of the soils will safely admit of its being executed: being continued occasionally in such a manner, as to induce the cultivator to leave it again for the production of this grass. In situations where such grounds could be conveniently flooded or covered with water occasionally, they might therefore be very advantageously converted into good meadow or grass-lands; a sort of application that has long since been recommended by De Serres, a French writer of great respectability: when such lands are perfectly broken up, they afford, in most cases, admirable crops of the grain kind: oats, as being least injured by a luxuriant growth, may, in general, be the most advisable as the first crop."

It has been advised, "as a good rule in these cases, to give good hoeings, either of the horse or hand kinds, as soon as weeds appear every time after the crops are taken off. If the plants are perfectly straight in the rows, which should always be the case, a shill may be had recourse to with the greatest benefit, as it may be drawn so closely to the plants, as in a great measure to save the expence of hand-hoeing, as, in such cases, it will be only necessary to extirpate the weeds or natural grass plants that may have established themselves among the lucern plants in the rows, which is capable of being effected in a very complete manner by the use of a pronged hand-hoe. And it is further recommended never, by any means, to suffer fields of this sort to become weedy, under the supposition, that the produce may not cut well, or be free from dust; as where it is of sufficiently vigorous growth, and of a suitable distance

in the rows, according to the nature of the land, there can be no reason for such an injurious practice, as it is only where the planting is executed at larger distances than the condition of the soil will permit, that any inconvenience can be experienced in this way."

It may be stated, that "where hand-hoeing is the method chiefly depended on for keeping crops of lucern in a proper state of culture, much of the business may be performed by women, or even children, and the expence be thus considerably lessened."

Application of Manure.—In cases where the soils on which this plant is grown are not of considerable fertility, the occasional application of manure may be of great advantage, in thickening and increasing the quantity of crop; for this use clean well rotted dung is probably by much the best manure, as where earthy composts, ashes, or foot are employed, they are apt to promote the growth of, or bring up grasses too much; the latter are, however, sometimes sown over the crop in the winter season. The dung is advised, in the 25th vol. of the Annals of Agriculture, to be applied in the quantity of about twenty tons to the acre, every five or six years. Mr. Kent, however, thinks it a better practice to put a slight coat on annually in the spring season. As much expence might be incurred in the culture, establishment, and after management of this sort of crop, in order to insure a favourable produce, the farmer should not too hastily attempt it, till he has found how far it will suit his convenience and other circumstances.

Expences of Cultivation.—The various expences attending it, as stated by different writers before the late rise in the price of labour, are thus given, as well as the profit in foiling horses. At present, however, a third more may be added, and, in some cases, much more.

Nearly double this is sometimes made by soiling clover.

Number of Cuttings and Manner of Cutting.—In a late practical work, it is stated that, "as this is one of the most forward of the artificial grasses, it frequently attains a sufficient growth for the scythe towards the end of April, or beginning of the following month; and in soils that are favourable for its culture, will be in a state of readiness for a second cutting in the course of a month or six weeks longer, being capable of undergoing the same operation, at nearly similar distances of time, during the whole of the summer season. In this last sort of soil, with proper management, in the drill method, it has been found to rise to the height of a foot and a half in about thirty or forty days, affording five full cuttings in the summer. But in the broad-cast crops, in the opinion of some, there are seldom so many cuttings afforded in the season, three or four being more common, as the growth is supposed to be less rapid, than by either of the other modes;" this is, however, contradicted by other cultivators, who have bestowed much care on the subject, as will be evident hereafter. And it is stated, that "in order to have new successions of this grass constantly becoming ready to be cut, it has been recommended, for the purpose of soiling, to have the broad-cast plantations formed into so many divisions, as that one of them may be cut daily, as about sixty; and those of the drilled, and transplanted kinds, into from thirty to forty, according to the nature of the land, consuming them in the same manner. These cuttings must, however, be varied in proportion to the differences in the growth of the crops, and the consumption. The most economical mode of cutting the produce is, without doubt, by means of the scythe; though the reaping-hook has been made use of by some; after being cut, the food should be conveyed, as soon as possible, to the animals; this may be done by a light cart, or large barrow, made for the purpose, according to the scale on which the business is conducted. One cutting in the day is only advised by some, but as there is a loss as well as injury done to all sorts of green-cut food by keeping, even for a few hours in hot seasons, it may be a better practice to have two cuttings in the day, especially when the weather is warm, and the lucern at no great distance; besides, the food is eaten better when quite fresh."

Value and Application of.—It is stated, that "the produce of this sort of crop, in converting it to the purposes of soiling cattle, will necessarily be different under different circumstances, but an acre can seldom, when under proper culture and management, support less than from three to five or six horses, or other cattle, during the six summer months, the profit of which cannot be less than from seven to ten or twelve pounds." "And in letting it remain for hay, which is less advantageous, in three mowings, an acre, where the crop is good, will seldom afford less than from three to five tons of dry hay. In Mr. Arbuthnot's trials, as stated in Mr. Young's Tour, the produce was four loads, but in those of others, on rich grounds, it was five. It is likewise remarked, that "in making this sort of plant into hay, the same directions should be attended to as for clover; the less the produce is shaken about the better, provided it be sufficiently quickly dried, as the leaves will be more fully preserved in the stems, and the hay, of course, more valuable. From its greater succulence, it will, in common, require rather more time than clover, or sainfoin, in making into hay. As this sort of hay is held in less estimation than that of either of the above grasses, it should always be consumed at home by the farm horses, or other stock; and that of the other sorts sent for sale."

But the principal and most advantageous practice, in the application of lucern, is that of foiling horses, neat cattle, and hogs; yet as a dry fodder, it may also be capable of affording much assistance in many cases; and as an early food for ewes and lambs, be of great value in particular cases. "As this plant bears repeated cutting, better than most of those of the artificial grass kind, springs in a more quick and expeditious manner, and affords a healthy nutritious food, it must be of vast utility to the farmer, where horses and cattle form a large part of his stock; with horses in this way, it has been found by some, as stated in the fourth volume of Mr. Young's Eastern Tour, 'to answer better than any other sort of green food that has been tried'. The number of cuttings that it admits of, being on different soils, and under different modes of culture, from about three to five, affording a produce of green herbage adequate to the support of from three to four or five horses, for a period of nearly six months in the summer season, as has been seen above; and though much of this vast advantage, in the support of these animals, may with propriety be ascribed to the economy of the consumption of the food, that unavoidably takes place in this excellent practice, the real produce in green food, is, without doubt, larger than in most other grass crops. The broad-cast crops, in the trials of some cultivators, appear to have been more profitable, in this mode of consuming the produce, than those of either the drilled or transplanted methods of culture; in the practice of Mr. Hall, the former supported from four to five horses for twenty-six weeks, while the transplanted crop, in rows two feet asunder, only afforded produce sufficient for the keeping of three. And in those of Mr. Clayton, in the broad-cast method, without grain, five horses were kept from the middle of May till Michaelmas, while that drilled in equidistant rows, at the distance of eighteen inches, only supported four." There are many other facts, that lead to the same conclusion. "On very rich soils, the drilled lucern will, without doubt, when the plants are kept perfectly clean, and the mould well stirred between the rows, and laid to their roots, afford an abundant produce, perhaps

more so than in the broad-cast; but to do this, great attention in the culture must be bellowed." And in "its application, in the foiling of cows, and other sorts of cattle, in the fold yards, and in the feeding and fattening of oxen, its importance is equally great. It is found that in foiling cows, the proportion of this sort of food, consumed in twenty-four hours, is from about sixty or seventy, to upwards of a hundred pounds, in those which are of the middle-sized kinds; an acre maintaining in the proportion of about four for twenty weeks. In other trials, larger proportions of stock have been kept by this practice." In feeding cattle with this sort of food, it is observed, that "in its green state, care is necessary, however, not to give the animals too much at a time, especially when it is moist, as they may be *braken* or *blown* with it, in the same way as with clover." The trials, it is added, that have been made in fattening bullocks or other cattle with this green fodder, are not numerous, but they are sufficiently so to prove its utility in such application. In Mr. Young's trials, cattle have been found to increase fast in flesh by it, paying at the rate of four shillings and sixpence a head *per* week, which is considered as a great proof of the value of the plant in this view. Its superiority to tares is prodigious. It has also been considered of the greatest value in this view, in Ireland, by Mr. Herbert, after much experience of it. The great power which it possesses in fattening is rendered indeed sufficiently evident, by the sudden effects which it produces in this way, in foiling horses; in most instances they get into high condition, in a short time becoming "fat, without oats or hay," in some cases. And "sheep have likewise been fattened on this green food with great success, in Mr. Baldwin's trials." Also, "in foiling hogs in the fold yards, it has been attended with considerable success and it has been suggested that as these animals do not live so closely as sheep, they may be admitted upon the crop with safety."

And the advantage of this mode of application over that of making the crops into hay, and their expense, produce, and profit, are stated by Mr. Young in this way.

Average of Five Crops.

Soils.	Application.	Expense.			Produce.			Profit.		
		£.	s.	d.	£.	s.	d.	£.	s.	d.

Further, the result of the comparative experiment made by Mr. Anderton with this crop, and those of burnet and saintfoin, as stated by the same writer in his Eastern Tour, shews its superiority over them clearly.

Lucern, at four cuttings, green, produced	159
Burnet - - - - -	84
Saintfoin - - - - -	82

And the advantages of making them into hay, are thus stated:

One cutting of each.			
Lucern, in grass, 57½ lb.	in hay,	22 lb.	
Burnet, in ditto, 2½	—	7	
Saintfoin, in ditto, 20½	—	9	

Although lucern crops should not be closely fed down with sheep, it is not improbable but that "in particular cases they may be applied as an early green feed for ewes and lambs with great utility and convenience, as they may be relied on for this sort of feed much sooner than any of the other kinds of artificial grass crops, especially in soils of the rich, dry, and warm descriptions, being often ready for this purpose soon after the middle of March, affording a good bite through the whole of the following month; the most difficult period for the providing of suitable support for this kind of stock. The benefit in the healthy growth and improvement of the lambs in this mode, will much more than counterbalance any loss sustained in the first cut, for the foiling of horses. The sheep

Weep should not, however, remain on longer than while the fresh shoots are eaten down." And it is concluded on the whole, that "though this plant is capable of being thus usefully applied, considering the great expences which are necessary in raising and keeping lucern crops in a state of production, and their affording but little produce, especially when sown without corn, for the two first years, notwithstanding they appear to yield a great advantage in the practice of foiling animals; it is probable that much of the profit depends upon the method of consuming them, and not on that of the particularly advantageous nature of the plant. Its superiority to clover, when the differences in the expences of their culture, and other circumstances, are fairly brought into view, will not perhaps appear so great as many, on a superficial observation, may have supposed. The point in which it most materially excels that almost invaluable plant, is, the duration, or time, which it lasts in the ground, after being once introduced, continuing from ten to fifteen and even twenty years, according to the state and nature of the soil and the attention that is bestowed in the after management. This is a circumstance of the first importance, in cases where the cultivator wishes to avoid the trouble and expence of grain crops, as he can keep a suitable extent of land under this crop, for the purpose of foiling his stock without them, while with clover it is utterly impossible. Where the proportion of land is small, and the quantity of cattle and horse stock disproportionately large, it is a plant admirably calculated for the cultivator's purpose, when grown convenient to the farm-yards, and kept in due order by proper cultivation. It has also been recommended on dairy farms, as of great utility in supporting the cows, and increasing the quantity of milk. Where the soils are suitable, a few acres under this grass, round the house, must in almost all cases be valuable for the purpose of early green food."

The advantages of cultivating lucern are considered by Mr. Young so extremely great, that the "agriculturist should, he thinks, determine at all events to have sufficient at the least, for the summer support of all his teams, and other horses; and if in addition to this quantity, he provides also for thus feeding much other stock in his farm-yard, he will find it a most profitable practice."

Breaking up old Lucern Grounds.—It has been already suggested, that "on attempting to break up lands that have been long under this sort of crop, it has been sometimes found, from the great strength of the roots of the lucern plant, and the consequent difficulty of destroying them, that they have been restored in such a manner, as to induce the cultivator to leave them again for the production of this grass." And that in situations where such grounds could be conveniently flooded or covered with water occasionally, they might be very advantageously converted into good meadow or grass lands. A sort of application, that has long since been recommended.

In cutting lucern crops, the author of the Farmer's Calendar suggests that it should always be performed in a longitudinal direction of the drills, or rows, or of the field, in order that a scarifying may be given to the young growth before it is too far advanced. And the same writer remarks, that this sort of crop requires much manure, for though on good land it may afford a good produce, without such application; to carry its cultivation to the highest state of perfection, "not only of *product* but also of *clear profit*," it should have plenty.

But though this sort of plant is seldom liable to be injured by the frost, in the southern districts of the kingdom, where it is the most extensively cultivated, a writer in an useful pe-

riodical work, complains that in an experiment of his, in which the lucern was drilled about a foot distant in the rows, it destroyed every plant. "A few indeed, (says he,) at distant intervals, recovered in the spring, and grew very decently, pushing out long, strong, and carrot roots; but their number was so inconsiderable, and the weeds so abundant and luxuriant, that it became necessary to plow all down." In this case the land does not seem to have been in a proper state of either preparation or heart for the growth of this sort of crop. And it is suggested, that in giving this sort of food to cows, it is necessary to have the precaution of letting it be made use of the day after it is cut, and not the same day, as in this case the animal is liable to swell. In his trials it was found that a large cow consumed about eighty-four pounds of this food in twenty-four hours, and that if more be given, the animal will probably waste it. And it is added, that the butter made from milk produced from this sort of food, is equal to any made from cows fed on the best meadows and pastures.

LUCERNA, in *Geography*, a town of France, in the department of the Po, lately belonging to Piedmont, in the province of the Four Vallies, to one of which it gives name; five miles S.W. of Pinerolo.

LUCERNA, in *Ichthyology*, a species of *Trigla*; which see.

LUCERNARIA, in *Natural History*, a genus of the Vermes Mollusca class and order. Body gelatinous, wrinkled, branched; mouth placed beneath. There are three species, which inhabit the Northern seas, and live among the "fuci" and "ulvæ," generally adhering firmly to their habitation, and rarely changing their abode; they feed on polypes, or onisci; the body is commonly headless and eyeless, with granulated tubercles.

Species.

QUADRICORNIS. Body long coiled, with four forked arms tentaculate at the tip. Inhabits fuci, and feeds on polypes. The body is without head or eyes, brown, pellucid, quadrangular, each angle running into an arm, the branches of which are terminated by a fasciculus of thirty or forty tentacula; tail flexuous in the middle and disposed in numerous plaits and folds, thickened at the base and tapering gradually, obtuse at the tip, and extensile, like the tentaculæ; mouth white with cinereous stria, and four-toothed.

PURYGIA. Body long papillous, with numerous globiferous arms deflected into an hemisphere; fixed at the base by a byssus or mass of filaments. This is found in the Greenland seas at a considerable depth, and seldom changes its abode. Body varying in shape, about half an inch long, reddish with white globules and papillæ; neck erect, extensile, and beset with numerous exsertile papillæ; arms short, slender, and entangled together.

AURICULA. Resembling an oil-disk; neck round, the lower extremities dilated and furrowed with eight fasciculi of tentacula. This species is likewise found in the Greenland seas, adhering very firmly to the largest ulvæ, from which it rarely moves; feeds on onisci, and is about an inch and a half long. Body black or reddish, rarely chestnut-brown with a gold tinge, lubricose, glabrous, the margin surrounded with eight granulate tubercles, resembling so many fasciculi of tentacula, containing about sixty in each; these are black tint with white; mouth white.

LUCERNATES, in the *Ecclesiastical History*, a term used by the primitive Christians for canticles, which they sung in their nocturnal assemblies; probably from these rites being performed by lamp-light.

LUCHNOW HILLS, in *Geography*, a range of mountains in Hindoostan, between the circars of Ruttunpour and Goondwana; the passage over which is called "Luchnow Pass," and is situated about eight miles W. of Kyragur.

LUCHO, a town of the principality of Pomerelia; 12 miles S.W. of Dantzic.—Also, a town of the principality of Lüneburg, on the Jetze, in a moist soil, so that most of the houses are erected on piles; 40 miles E.S.E. of Lüneburg. N. lat. 52° 58'. E. long. 11° 17'.

LUCHOWICZE, a town of Lithuania, in the palatinate of Novogrodek; 40 miles S.S.E. of Novogrodek.

LUCIA, *St.*, or, as it is called by the French, *St. Oloffe*, from its having been discovered on St. Lucia's day, one of the Charaibe or Caribbee islands in the West Indies, about 27 miles in length from N. to S., and 12 broad. In this island are several hills, two of which are remarkably round and high, and said to have been volcanoes. At the foot of these hills are fine vallies, well-watered, and having good soil, that produces trees, the timber of which serves the planters of Martinico and Barbadoes for building their houses and windmills. The island also supplies plenty of cocoa and fustic. The air, fanned by the trade winds, which, by the arrangement of the hills, are admitted into the island, and thus moderating the heat, is reckoned salubrious. The island has several good harbours and bays, which afford commodious anchorage; particularly the "Little Carénage," which is accounted the best in all the Caribbees, and which induced the French to prefer it to the other neutral islands. This harbour possesses several advantages, such as its depth, the excellent quality of its bottom, and its convenient careening places. Thirty ships of the line may lie here sheltered from hurricanes, without the trouble of mooring them. As to the other harbours, the winds are always favourable for going out, and the largest frigate may be in the offing in less than an hour. In the island are nine parishes, eight to the leeward, and only one to the windward. A high road is made round the island, and two others which cross it from E. to W., and thus afford an easy conveyance of the commodities of the plantations to the barcaderes, or landing places. In the year 1769, the free inhabitants of the island amounted to 2524; the slaves to 10,270. Of cattle it had 1819 horned beasts, and 2378 sheep, besides 598 mules and horses. Its plantations consisted of 1,279,680 plants of cocoa; 2,463,880 of coffee; 681 squares of cotton; and 254 of sugar canes: 16 sugar works were actually at work, and 18 nearly completed. Its produce yielded 112,000*l.*, which was capable of being improved to 500,000*l.* After the English had been settled for some time in this island, the Charaibes, mitigated by the French in the year 1638, either killed or drove from the island the English settlers with their governor. When the civil wars broke out in England, a party of French arrived here, under a person named Rousselan, well provided with stores and ammunition. Rousselan recommended himself to the Charaibes, so that he and his colony carried on an advantageous trade; but upon his death in 1654, he was succeeded by La Riviere, who with his whole colony was massacred by the Charaibes. It is needless to recount the attempts made by the French, and also by the English in 1672, and at a later period in 1723, to obtain and preserve a settlement in this island. At length, when the English were compelled to relinquish all hopes of obtaining this and other islands by force, St. Vincent, Dominica, Tobago, and St. Lucia were declared neutral by the treaty of Aix-la-Chapelle in 1748; and those who remained of the ancient proprietors were left in unmolested possession. The treaty

of neutrality was no sooner concluded, than both English and French appeared dissatisfied with the arrangement they had made. The English, in particular, discovered, that by acceding to the compromise, they had given up St. Lucia, an island worth all the rest, and to which, it must be owned, they had some colourable pretensions, founded on a treaty entered into with the Charaibe inhabitants in 1664, 600 of whom attended an armament that was sent thither by lord Willoughby, and actually put the English publicly and formally into possession. By the peace of Paris, February 1763, the three islands of Dominica, St. Vincent, and Tobago were assigned to Great Britain; and St. Lucia to France in full and perpetual sovereignty; the Charaibes not being once mentioned in the whole transaction, as if no such people existed. The English took this island in the year 1770, but restored it at the peace in 1783; it was retaken by the English in 1794, restored in 1795, and retaken in 1796; restored and recaptured in 1803. N. lat. 13° 37'. W. long. 60° 30'.

LUCIA, *St.*, a town of Sicily, in the valley of Demona; seven miles N. of Messina.—Also, a town of the island of Corfica; six miles N.E. of Corte.—Also, one of the smaller Cape Verd islands, about 24 miles in length, high and mountainous. On the E. side is a harbour, defended by two small islands, which afford good shelter and anchorage. N. lat. 16° 46'. W. long. 24° 30'.—Also, a town of South America, in the government of Buenos Ayres, on the E. side of the river Plata; 140 miles N. of Santa Fé.—Also, a town of Brazil, in the government of Goyas, on the river Tocantins. S. lat. 12° 20'.—Also, a town of South America, in the government of Buenos Ayres, on the Parana; 110 miles S. of Corrientes.—Also, a town of Peru, in the government of Arequipa; 50 miles S.E. of Arequipa.—Also, a town of South America, in the audience of Quito, on the Daülé; 35 miles N.N.W. of Guayaquil.—Also, a town of Italy, in the Trevisan; 20 miles E.S.E. of Trevigio.—Also, a river of Africa, which runs into the Indian sea; S. lat. 28.—Also, a river of America, in East Florida, which runs S.E. along the E. side of the peninsula, and communicates inland with the Indian river.

LUCIA Bay, *St.*, a bay on the E. coast of the island of Borneo. N. lat. 4° 16'. E. long. 117° 18'.

LUCIAN, in *Biography*, a distinguished Greek writer, a native of Samosata, on the banks of the Euphrates, was born in the reign of Trajan, of mean parentage, and in his youth was placed with his uncle to learn the art of a statuary. Having no genius for the profession, and failing of success in some of his first attempts, he withdrew from his master, and went to Antioch, where he engaged in literary studies, and embraced the profession of a pleader. He reported, that he was induced to this step by a dream, in which Learning seemed to draw him to her, and to promise to his efforts fame and immortality. He was soon disgusted with the contention of the bar, and confined himself to the practice of eloquence as a sophist or rhetorician, in which capacity he visited several foreign countries, particularly Greece, Italy, Spain, and Gaul. The emperor M. Aurelius was sensible of his great merit, and appointed him register to the Roman governor of Egypt. He died about the year A.D. 180, when he had attained the great age of 90. The works of Lucian, which are numerous, and written in the Attic dialect, consist chiefly of dialogues, in which he introduces different characters with much dramatic propriety. His style is easy, simple, elegant, and animated, and he has stored his compositions with many lively sentiments, and much of the true Attic wit. His frequent obscenities, and his vulgar manner of exposing to ridicule almost

almost every kind of religion, have drawn upon him the censure of moralists in all ages. The best editions of Lucian's works are those of Bourdelet, Paris 1615; of Grævius, Amst. 1687; of Reitzius, Amst. 1743; and the Bipontine edition in 10 vols. 1789—93.

LUCIAN, (de elect. seu Cygnis,) is the only ancient writer who has dared to doubt of the musical abilities of swans. He tells us, with his usual pleasantry, that he tried to ascertain the fact, by making a voyage on the coasts of Italy; and relates, that being arrived at the mouth of the Po, he and his friends had the curiosity to sail up that river, in order to ask the watermen and inhabitants concerning the tragical fate of Phaeton; and to examine the poplars, descendants of his sisters, whom they expected to shed amber instead of tears; as well as to see the swans represent the friends of this unfortunate prince, and hear them sing lamentations and sorrowful hymns, night and day, to his praise, as they used to do in the character of musicians, and favourites of Apollo, before their change. However, these good people, who never had heard of any such metamorphoses, freely confessed, that they had indeed sometimes seen swans in the marshes near the river, and had heard them croak and scream in such a disagreeable manner, that crows and jays would be sirs, compared with them, in a musical capacity; but that they had never even dreamed of swans singing a single note that was pleasing, or fit to be heard.

LUCIAN, a Christian martyr in the fourth century, is supposed to have been a native of Antioch, of which place he became a presbyter. He was a pious and learned man, very eloquent, and well skilled in the knowledge of the scriptures. He published an edition of the Septuagint, with corrections, suggested by a collation of ancient copies, which version was generally used in Jerome's time by the churches from Constantinople to Antioch. He published also an edition of the New Testament, the canon of which appears to have been much the same with that of other Christians. Jerome does not commend these editions; he depreciates Lucian's Septuagint in comparison with Origen's. It is certain that Lucian was in high esteem with the Arians of the fourth century, and on that account it has been supposed that he adopted their principles; though he is claimed on the other side as the advocate of the doctrine of the Trinity; but Dr. Lardner, who has examined the question with his usual diligence, candour, and impartiality, observes, "Whether Lucian's opinion concerning the Trinity, particularly concerning the *Word*, was the same with that, which is now reckoned orthodox, or not, which is a point not easily determined; we have seen other accounts of him which are unquestioned; and all must be satisfied, that he was a pious, learned, and diligent man; that he believed Jesus to be a divine teacher and the Christ." During the persecution of the Christians in the reign of Maximin, Lucian was apprehended, and conducted to Nicomedia, where the emperor then was. Here he was commanded, in the presence of the monarch, to renounce the Christian faith; this he not only refused, but delivered an able and very eloquent defence of it, of which the following is given in Lardner: "It is no secret, said he, that the God whom we Christians worship, is the one God declared to us by Christ, and by the Holy Ghost inspired in our hearts. I own, that we also once trusted in gods of our own making, but Almighty God, commiserating the errors of mankind, sent his wisdom into this world clothed in flesh to teach us the knowledge of God, who made the heavens and the earth, who is eternal and invisible. He, moreover, gave us a rule of life, and delivered to us the precepts of righteousness; he taught us to practise sobriety, to rejoice in poverty, to be very meek,

to be willing to suffer, to preserve the purity of our minds, to be patient at all times. He likewise foretold the things that have since happened to us; that we should be brought before kings and rulers, and be slaughtered as victims; for which cause also, though he was immortal, as being the Word and Wisdom of God, he yielded himself to death, that, whilst he was in the body, he might set us an example of patience. Nor did he deceive us by dying, but on the third day rose again, being innocent and unspotted, and undergoing death only that he might overcome it by rising again. These things are well attested, and a large part of the world now acknowledge the truth of them." Upon this he was sent to prison, and speedily put to death, but in what manner is not known. He was buried at Heleopolis. Lardner, vol. iii. edit. 1788.

LUCIANA, in *Geography*, a town of Spain, in the province of Seville; eight miles W.N.W. of Ecija.

LUCIANANO, a town of Etruria; 12 miles W. of Cortona.

LUCIANISTS, or LUCANISTS, a religious sect, so called from Lucianus, or Lucanus, a heretic of the second century, being a disciple of Marcion, whose errors he followed, adding some new ones to them.

Epiphanius says, he abandoned Marcion; teaching, that people ought not to marry for fear of enriching the Creator; and yet other authors maintain, that he held this error in common with Marcion, and other Gnostics. He denied the immortality of the soul; asserting it to be material.

There was another sect of Lucianists, who appeared some time after the Arians. They taught that the Father had been a Father always, and that he had the name even before he begot the Son; as having in him the power, or faculty of generation; and in this manner they accounted for the eternity of the Son.

LUCIANO, in *Geography*, a town of Spain, in New Castile; 19 miles W. of Ciudad Real.

LUCID INTERVALS, the fits of lunatics, or maniacs; wherein the phrenzy leaves them in possession of their reason.

It is said, lunatics are capable of making a will in their lucid intervals.

LUCIDA CORONÆ, in *Astronomy*, a fixed star of the second magnitude, in the northern crown. See CORONA Borealis.

LUCIDA Hydra. See COR Hydra.

LUCIDA Lyra, a bright star of the first magnitude, in the constellation Lyra.

LUCIDO, ST., in *Geography*, a town of Naples, in Calabria Citra; 11 miles W.N.W. of Cosenza.

LUCIDUM SEPTUM. See SEPTUM.

LUCIFER, in *Astronomy* and *Mythology*, a name given to the planet Venus, when she appears in the morning before sun-rise.

LUCIFER, in *Biography*, a celebrated bishop of Cagliari, the metropolitan city of the island of Sardinia, flourished in the fourth century. He was one of the deputies sent by pope Liberius to Milan, in the year 354, at the time when the emperor Constantius had summoned a council for the purpose of condemning Athanasius. Lucifer, and Eusebius, bishop of Vercell, adhered most strenuously to the cause of Athanasius, which so enraged the emperor that he banished them into the East. Lucifer was sent to a city in Syria, from whence he was removed to Eleutheropolis in Palestine. Here he wrote two books, in defence of Athanasius and his supporters, with so much boldness, or perhaps violence, that St. Jerome says he must at the time have made up his mind to the suffering of martyrdom. These books he not only made public, but sent a copy of them to Constantius.

in his own name. The emperor, amazed at his intrepidity, desired them to be returned to the bishop, in order that he might have an opportunity to acknowledge or to disavow them. The prelate avowed himself the author, and knowing the probable consequences, said he was ready to suffer death in defence of what he had written and done. Athanasius sent him a letter of thanks for the service which he had performed for the Catholic cause, and requesting a copy of his works, which he either translated himself, or caused to be translated from the Latin into Greek. On the death of Constantius, Lucifer recovered his liberty and came to Antioch, where the Catholics were divided into two parties. Lucifer widened the breach already made, by joining with the opponents of the bishop of Miletus, who, though a Catholic, was ordained by bishops suspected of Arianism, and had communicated with them, and ordained a Presbyter among the malcontents to the episcopal office. This step was condemned by his friend, and formerly fellow sufferer Eusebius, who had been sent to Antioch by the synod of Alexandria, with the view of re-establishing the peace of the church. But Lucifer determined to maintain what he had done, and withdrew from the communion of Eusebius, and he formed a party, called after himself Luciferians, who resolved to avoid all commerce or fellowship with those bishops who had declared themselves in favour of the Arians. With this resolution he went into Sardinia, and thereby produced a schism in the church, which at first spread widely, but did not obtain numerous adherents, and does not appear to have out-lived the century. Lucifer died about the year 370. His works are written in a harsh and barbarous style. According to Lardner, they consist very much of passages of the Old and New Testament, cited one after another, which he quotes with marks of the greatest respect. He farther adds, that the works of this prelate have not yet been published with all the advantage that might be wished. The titles of these works are "Ad Constantinum Imperatorem, lib. ii.;" "De Regibus Apollaticis;" "De non conveniendo cum Hereticis;" "De non parcendo Delinquentibus in Deum;" "Quod moriendum sit pro Filio Dei;" and "Epistola brevis ad Florentium." They were collected together, and published at Paris by John Till, bishop of Meaux, in 1568. Gen. Biog. Lardner, vol. iv. edit. 1788. Moreri.

LUCIFERA, in *Mythology*, a surname given to Diana, under which title she was invoked by the Greeks in childhood. She was represented as covered with a large veil, interspersed with stars, bearing a crescent on her head, and holding in her hand a lighted flambeau.

LUCIFERIANS, a religious sect, who adhered to the schism of Lucifer, bishop of Cagliari, in the fourth century, who was banished by the emperor Constantius, for having defended the Nicene doctrine concerning the three persons in the Godhead.

St. Augustine seems to intimate, that they believed the soul, which they considered as of a carnal nature, to be transmitted to the children from their fathers. Theodoret says, that Lucifer was the author of a new error. The Luciferians increased mightily in Gaul, Spain, Egypt, &c. The occasion of the schism was, that Lucifer would not allow any acts he had done to be abolished. There were but two Luciferian bishops, but a great number of priests and deacons. The Luciferians bore a peculiar aversion to the Arians.

LUCILIUS, CAIUS, in *Biography*, a Roman poet, was born at Suessa, in the country of the Aurunci, about the year 148 B.C. He was of a good family, and in the Numantine war bore arms under Scipio Africanus the

younger, with whom, and his friend Lælius, he lived in terms of friendship. He is looked upon as the founder of satire, and as the first considerable writer of satires among the Romans. From Horace, who refers to them several times in his own satires, it appears that he imitated the old Greek comedians in marking out by his censure individuals notorious for their vices, even those of the very highest rank. Though superior to his poetical predecessors at Rome, and though he wrote with great roughness and inelegance, he gained many admirers. By Horace he is compared to a river which rolls upon its waters precious sand, accompanied with mire and dirt. Of his thirty books of verses only a few scattered fragments are come down to modern times. He died at Naples about the year B.C. 103. His fragments have been collected and published, with notes by Francis Douza, in quarto. They are also given in Maittaire's "Corpus Poetarum."

LUCINA, of *lux, light*, in *Mythology*, a deity who presided over the labour of women and the birth of children. This title is sometimes given to Diana, but most commonly to Juno.

LUCIO, ST., in *Geography*, a town of Etruria; 14 miles E.S.E. of Leghorn.

LUCIOPERCA, in *Ichthyology*, a species of *Perca*; which see.

LUCIPARA, or **LUSIPARA**, in *Geography*, a small barren island in the East Indian sea, near the S. coast of the island of Banca. S. lat. 3° 14'. E. long. 106° 20'.

LUCITO, a town of Naples, in the county of Molise; 11 miles N.E. of Mohse.

LUCIUS I., pope, in *Biography*, succeeded to the high dignity upon the death of Cornelius in the year 252, and after a short pontificate he is supposed to have died in March 253. He was banished Rome immediately after his ordination, under the reign of Gallus; but he soon returned to the great joy of his flock, who crowded to meet him. St. Cyprian wrote him a letter of congratulation, in which he observes, that he was perhaps recalled to be immolated in the sight of his flock, that they might be encouraged and animated by his Christian constancy and resolution. Cyprian in another place calls him a martyr, nevertheless we have no account of the manner of his death, and hence it has been thought that the expression made use of by this father is not to be understood strictly and literally.

LUCIUS II. pope, raised to that dignity on the death of Celestine II. in 1144, was a native of Bologna, who embraced the ecclesiastical life among the canons of St. Augustine. In 1125 he was created a cardinal, and appointed librarian of the Roman church. After this he was nominated the chancellor, and twice was sent papal legate into Germany. A short time before the death of Innocent II. the Romans threw off the papal yoke in temporal matters, restoring the senate, and creating their own magistrates, to whom they would yield obedience. In this attempt to recover their ancient liberties, they persisted after the election of Lucius, whom they acknowledged for lawful pope, but would not own him for their sovereign. They contended that it was inconsistent with the profession of the clergy, that they should possess lordships, estates, and temporal dominion, and that they ought to content themselves with such decent subsistence as they might derive from voluntary tithes and oblations. To Lucius, as their bishop, they paid all due respect; but soon after his election, they veiled the patrician dignity in one of their own body, and submitted to him as their prince. Lucius took every method to oppose their plans; he sought assistance from Conrad, king of Germany, and when he was refused, he put himself

himself at the head of his own troops, and marched against the Capitol, where the senate was sitting. His forces were defeated and himself wounded with a stone, which terminated his life in a few days, after a pontificate of about eleven or twelve months. Some of his letters are extant in the 10th vol. of the Collect. Concil.; and two in the second vol. of Baluze's Miscel.

LUCIUS III., pope, a native of Lucca, was educated to the church, and after various degrees of preferment, he was created cardinal by Innocent II. By Adrian IV. he was sent legate into Sicily; after this pope Alexander III. appointed him legate to the emperor Barbarossa, and on the death of Alexander in 1181, he was raised to the holy see. He was the first pope who was elected by the cardinals alone, to the exclusion of the people and clergy, who had hitherto taken a part in the choice of a new pope. Towards the close of the year 1182, a quarrel took place between the pope and the Romans, owing to his refusal to comply with some customs which had been observed by all his predecessors. The people broke out into insurrection, and drove him out of the city, pursuing him from one strong hold to another, till he retired for safety to Verona. At first he was ably supported by the emperor, who ordered Christian, archbishop of Mentz, to march in his defence at the head of a powerful army. This prelate soon reduced all the strong holds in the neighbourhood of Rome, and so harassed the Romans, that they were ready to receive the pope on his own terms, when the death of Christian produced a sudden alteration in the state of affairs; and the Romans, feeling their power, became more determined than ever in their opposition. Lucius sent nuncios to all Christian princes and bishops to gather contributions; large sums were gained which he spent in bribing the leaders of the opposing parties, and then ventured to return to Rome. A second insurrection drove his holiness to Anagni, whence he went into Lombardy, to implore the protection of the emperor, who was at that time on his march into Italy, for the purpose of holding a council at Verona. In 1184 the council was opened, and the pope preferred his complaints against the Romans, painting, in the strongest colours, the enormities which they had perpetrated; and they were, without hesitation, declared enemies of the church. To this council is to be traced the origin of the inquisition against heretics. For not only were the Albigenses condemned and anathematized anew, under different names, but all who should admit them into their houses, suffer them in their territories, or afford them any sort of relief. Under the same sentence were included all those who held or taught different doctrines from those held and taught by the Roman church. Some grounds of dispute arose between the emperor and the pope, as well with respect to the reinstatement of certain bishops who had been suspended; as also on account of the pope's refusal to crown the emperor's son Henry, and to give him the title of emperor. The pope, however, was not willing to proceed to a direct rupture with the emperor, and the business in dispute was suspended. In 1184, we find Lucius pressing, with great earnestness, the Christian princes to send powerful succours to the assistance of their friends and brethren in the Holy Land. While he was promoting, to the utmost of his power, a new crusade, he died at Verona in November 1184, after a pontificate of little more than four years. He is commended for prudence, piety, and unblemished manners. Two of the "Letters," and a "Decree" of this pope's, are to be found in the 10th vol. of the Collect. Concil. Mr. Gibbon, speaking of the 2d and 3d Lucius, says, "I cannot forget the sufferings of two pontiffs of the same age,

the second and third of the name of Lucius. The former, as he ascended in battle array to assault the Capitol, was struck on the temple by a stone, and expired in a few days. The latter was severely wounded in the persons of his servants. In a civil commotion several of his priests had been made prisoners, and the inhuman Romans, reserving one as a guide for his brethren, put out their eyes, crowned them with ludicrous mitres, mounted them on asses with their faces to the tail, and extorted an oath, that in this wretched condition they should offer themselves as a lesson to the head of the church." Bower. Moretti. Gibbon, vol. xii.

LUCIUS, in *Ichthyology*, a species of *Esox*; which see.

LUCIUS *Martinus*, the *Sea-pike*, a name given by some authors to the fish more usually called the *merlucius*, and in English the *hake*. See *GADUS*.

LUCIUS *Martinus* is also used by many authors for the *judis*, called also by some *sphyræna*.

LUCIUS *Terræstris*, the *Land-pike*, in *Zoology*, the name of a very singular species of American lizard, which has the shape, scales, &c. of the pike-fish; in the place of the fins of that fish it has four legs, but these are so weak and slender that it makes no use of them in walking, but crawls along upon the ground in the manner of a snake, and draws its legs after it; it grows to about fifteen inches long, with a proportionable thickness; it is all over covered with small, strong, and glossy scales, of a silver grey. In the night they retire into holes and caverns, and make a very disagreeable and loud noise, much louder than the croaking of frogs. They seldom stir out of their holes, unless in the dusk of the evening; and if they are ever met with in the day-time, their strange motion surprises all who see them.

LUCKAMPOUR, in *Geography*, a town of Bengal; 70 miles N.W. of Midnapour.

LUCKAU, or LUCCA, a town of Lower Lusatia, in a circle of the same name, on the river Preile, containing four churches, a Latin school, and an hospital; 49 miles N. of Dresden. N. lat. 51° 51'. E. long. 13° 40'.

LUCKENS, a town of Sweden, in the province of Drontheim; 25 miles S.S.W. of Drontheim.

LUCKENWALDE, a town and principal place of a circle, in the duchy of Magdeburg; 50 miles E. of Magdeburg. N. lat. 52° 6'. E. long. 13° 3'.

LUCKERCOOT, a town of Hindoostan, in Guzerat; 30 miles E. of Godra.

LUCKIA, a town of Hindoostan, in Oude; 40 miles N.E. of Gooraspour.

LUCKIDAU, a town of Bootan; 40 miles N. of Beyhar, 46 geographical miles in horizontal distance from Tassafudon. N. lat. 26° 56'.

LUCKIGATCHY, a town of Bengal; 10 miles N.E. of Kishenagur.

LUCKINPOUR, a town of Hindoostan, in the circle of Cicacole; 24 miles N. of Cicacole.—Also, a town of Hindoostan, in Surgooja; 10 miles S.W. of Surgooja.

LUCKIPOUR, a town of Bengal; 40 miles S.E. of Calcutta.—Also, a town of Bootan; 55 miles S. of Tassafudon.—Also, a town of Hindoostan, in Bengal; 35 miles S.S.W. of Comillah.—Also, an island in the mouth of the river Ganges, about nine miles long and two broad. N. lat. 22° 27'. E. long. 90° 48'.—Also, a town of Bengal, on an island of the same name; 50 miles S. of Dacca.

LUCKMIPOUR, a town of Hindoostan, in Bahar; 30 miles E. of Bahar.—Also, a town of Bengal; 32 miles S.S.E. of Curruckpour.

LUCKNADANG, a town of Goendwana; 88 miles N. of Nagpour.

LUCK.

LUCKNORE, a town of Hindoostan, in Bahar; 28 miles S. of Patna. N. lat. $25^{\circ} 8'$. E. long. $85^{\circ} 16'$.

LUCKNOUTI. See GOUR.

LUCKNOW, a circar of Hindoostan, in Oude, bounded on the N. by Kairabad, on the E. by Oude circar, on the S. by Manickpour, and on the W. by Cawnpore; about 75 miles long, and 45 broad. The capital is Lucknow.

Lucknow, a large and populous, but irregular and inelegant, city of Bengal, capital of the fore-mentioned circar, and of the subah of Oude, situated on the Goomty, which runs on the N. side of the town, and is navigable for boats of a common size at all seasons of the year; founded by Lutfehan, or Laeman, and rebuilt by Bikramadit, king of Oude. The spot on which the founder resided is preserved in remembrance by a mosque, erected for this purpose by Aurungzebe. This is a very ancient city, and moderately extensive; many of the houses are of brick, but the greater part consists of mud walls, covered with tiles, and built on scattered eminences, so that the ascents and descents are numerous and fatiguing; and the streets are narrow and filthy, no care being taken to preserve them clean. Most of the old palaces were destroyed by Suja Dowla, and others erected. The magnificent edifices are few. The houses of the merchants are constructed of brick, and are lofty and strong. Lucknow is distant from Allahabad 127 miles; from Agimere 428; from Arcot 1147; from Bahar 388; from Cabul 1118; from Dacca 790; from Dowlatabad 728; from Golconda 794; from Gwalior 211; from Oude or Fyzabad 85; from Patna 316; from Seringapatam 1201; from Villapour 920. N. lat. $26^{\circ} 52'$. E. long. $81^{\circ} 14'$.

LUCKO, or LUZK, a city of Russian Poland, capital of the palatinate of Volhynia, with a castle, where the bishop of Volhynia resided, and where the Jesuits had a college; it is also the residence of a Russian bishop, and has a provincial diet, and court of judicature; 200 miles E.N.E. of Cracow. N. lat. $50^{\circ} 45'$. E. long. $25^{\circ} 19'$.

LUCKOUR, a town of Hindoostan, in the circar of Sohajepour; 20 miles S. of Sohajepour.

LUCKUMRY, a town of Meckley; 35 miles W. of Munnypour.

LUCO, a town of Naples, in Abruzzo Ultra; nine miles S.S.W. of Celano.

LUCON, a town of France, and see of a bishop before the revolution, in the department of the Vendée, and chief place of a canton, in the district of Fontenoy le Comte; 15 miles from it. It is situated on a canal, about six miles in length, communicating with the sea. The environs are marshy, and the air is unwholesome. The place contains 2630, and the canton 8572 inhabitants, on a territory of $332\frac{1}{2}$ kilometres, in 10 communes. N. lat. $46^{\circ} 29'$. W. long. $1^{\circ} 4'$.

LUÇON, or LUZON, sometimes called *Manilla*, from its capital, is the largest and most important of the Philippine isles, being more than seven degrees, or near 500 British miles in length, and about 100 of medial breadth. This island is pervaded in its length by a high chain of mountains towards the east, so that its interior parts are difficult of access; and the examination of it is also restrained by the jealousy of the Spaniards. It is also traversed by the branches of a considerable river, on the banks of which the capital is seated; and its lakes are numerous, the largest of which is the source of the river Manilla. Several volcanoes occur in this island, nor are earthquakes uncommon. Its soil is uncommonly fertile, and its products are gold, copper, and iron. Such is the fertility of the soil, that rice, which in other countries requires much cultivation, grows every where with little

or no attention, and even in the highest mountains, without being watered. Of rice they have different kinds, some of which requires four or five months between the sowing and the harvest, and some which is sown and reaped within 40 days. Although they have no wheat but that which is imported, the soil is very capable of bearing it, as appeared by an experiment, in which one bushel produced 130. The grafts grow, the trees bud, blossom, and bear fruit all the year, not only in the gardens but on the mountains. The richest fruits of the West Indies, as well as of the East, are here abundant, and some that are found nowhere else. Here are 40 different sorts of palms, the most excellent cocoas and cassia, the sugar-cane and cotton of peculiar beauty. In the mountains are found wild cinnamon, wild nutmegs, ebony, sandal wood, together with excellent timber for building and shipping. Gold is found upon the mountains in every part of the island, washed out of the earth by the heavy rains; in the mould of their vallies, carried down by their rivulets; and in the sand and mud of their lakes, brooks, and rivers. The Spaniards obtain about 1000 or 1500 pounds weight every year, as a tribute of the inhabitants. All kinds of cattle abound, so that a large fat ox does not cost above four pieces of eight. Civet-cats are also very common, and their civet is highly valuable. Ambergris is also thrown on their coasts in prodigious quantities. The natives, who are of a mild character, are called Tagals, like all those of the Philippines, and seem to be of Malay origin. They are tall and well made, wearing only a kind of shirt, with loose drawers; but the dress of the women is chiefly a large mantle, and their black and beautiful hair sometimes reaches the ground; their complexion is a deep tawny. Their houses are of bamboo covered with palm leaves, raised on pillars to the height of eight or ten feet. The chief food is rice, which is often eaten with salted fish. M. Sonnerat has given some account of the interior part of the country, as far as he was able to penetrate it. At the distance of about a day's journey from the capital, he found himself buried in woods, no habitation nor appearance of cultivation presenting themselves to his view. Some scattered Indians, having their shoulders covered with the skins of wild goats, the rest of the body being naked, with a bow in their hands and arrows on their back, were discovered. Their looks were haggard, and their countenances very unprepossessing. They seemed to be timid and disposed to flee from the face of man, and even from one another. They have no society; they are solitary wanderers; stopping when night overtakes them, and sleeping in the hollows of trees. They have no families, and they seem to be constrained merely by instinct to sue the females whom chance has thrown in their way. After traversing the wood above-mentioned, M. Sonnerat was led to a large lake, in the middle of which is an island, where some Indian families have taken refuge; here they live by fishing, and preserve their liberty, suffering no one to land on the place, which serves them for an asylum. On the E.S.E. the lake is bounded by high mountains; the soil is fertile, and there are many fruit trees; and hence Manilla is supplied with fruit. These mountains are inhabited by a mild set of people, who employ themselves in making mats, cloth, and different works with the abacca, a kind of banana which bears no fruit, and of which the filaments are very strong. These people have laws, and punish crimes, the chief, in their estimation, being adultery. On the other side of the mountains, which bound the lake on the E.S.E., are immense plains, traversed by large and deep rivers, which diffuse fertility. Here are a few scattered villages inhabited by men, without morals, without virtue, without equity; who

who fear each other, and having no protection from laws, trust to the force of arms alone for their safety. In a word, they live in perpetual distrust and dread of one another. Nevertheless, says our traveller, the arts have reduced this savage nation, without softening their ferocious manners. Columba was the name of one of the largest villages possessed by this savage tribe; and on the day of his arrival the people had a grand festival, which they celebrated with divers spectacles. Part of these spectacles was the exhibition of a tragedy, and this was preceded by a cock-fight, and by other games, at which large sums were won and lost. Two leagues from Columba, in a village of less extent, was a rivulet, whose water was hot and boiling; and yet on the banks of this rivulet were vigorous shrubs; one of these shrubs was an "agnus castus," and the two others "aspalatus." The Spanish governor, conceiving that these waters possess some good qualities, has constructed near them several baths. Fish were found swimming in this water, the heat of which was so great, that our author could not touch it. In the interior of the country, he says, there are many nations, which the Spaniards have in vain endeavoured to subdue. No force is sufficient to subjugate them; but they fly to a distant asylum, and there it is said they swear an implacable hatred against the oppressors of their country, meditating and preparing means of vengeance. From thence they issue in mean boats; but fortified by courage, and animated by hatred, they dare to approach the gates of the capital. Their incursions are a succession of pillages, murders, ravages, and rapes. On leaving the village, traversed by the rivulet of hot water, our author took an easterly route, and after three hours' journey, found himself in an immense plain, which was watered and rendered fertile by a rivulet of clear, light, and wholesome water, that descended from the top of a neighbouring mountain. Large meadows were enamelled with flowers, whose variety of colour and perfume delighted equally the sight and the smell. The inhabitants were friendly and hospitable.

In some provinces of this island there are Pintadoes, that is, painted negroes, whose persons are tall, straight, strong, and active, and disposition excellent; and to the blacks, such as we have described, who live in the mountains and thick woods, the Spaniards have given the name of Negrillos; they are a rude and barbarous people. In the mountains, near springs, and in caves pleasantly situated, there is a nation called the Ilayas, or Tinghianos, who, as some suppose, are descended from the Japanese, as free as the Negrillos, but differing from them in disposition and character; for they are not only very brave, but very courteous and humane. This island is divided into provinces, most of which are under the jurisdiction of the Spaniards. The principal are the Balayan, in which are 2500 tributary Indians; in that of Camarinas is the city of New Caceres, the see of a bishop. Paracale contains 7000 Indians, who pay tribute to Spain; this province abounds in mines of gold and other metals, and of valuable load-stones. In Cagayan are 9000 tributaries; but the richest and most populous province is said to be that of Ilocos, whose coast extends upwards of 90 miles. There are several others, such as Pangasinan, Bahi, Balacan, &c. N. lat. $12^{\circ} 48'$ to $18^{\circ} 48'$. E. long. $120^{\circ} 6'$ to $124^{\circ} 10'$. See MANILLA.

LUCOTTA, a small island in the East Indian sea, near the W. coast of Sumatra. N. lat. $1^{\circ} 43'$. E. long. $97^{\circ} 25'$.

LUCRETIA, in *Biography*, a distinguished Roman lady, was the wife of Collatinus, a relation of Tarquin, king of Rome. Her accomplishments proved fatal to her;

and the praises which a number of young nobles at Ardea, who were attached to the Roman army, among whom were Collatinus and the sons of Tarquin, bestowed upon the domestic virtues of their wives at home was, in truth, productive of a revolution in the state. While each was warm with wine, it was agreed that they should instantly take their horses, and go to Rome to ascertain the fact how the wife of each was employed. The ladies of the Tarquins were found passing the night with their friends and relatives at a banquet, but Lucretia was employed in the midst of her female servants, and sharing their domestic labours. The beauty and innocence of Lucretia, who received her husband and the young princes with the most exquisite female grace, made such an impression upon Sextus Tarquinius, that he resolved, at whatever expence, to gratify the guilty and infamous passion which he had conceived. In a few days after, he left the camp in secrecy, and came to the house of Lucretia, who entertained and lodged him with a noble and unsuspecting hospitality; but, in return for her kindness, in the dead of the night he introduced himself to the virtuous lady, who refused to his intreaties, what her fear and shame granted to his savage threats. She submitted to the cruel wretch, whom he not only, with a drawn sword, threatened to murder, but to blast also her reputation, by killing one of her slaves, and putting him in her bed, that an apparent criminal connection might seem to have met with its deserved punishment. Tarquin left her in triumph, but his exultations were short-lived; she, who had lost her honour, had nothing left in life of any value: she assembled, in the morning, her husband, her father, and nearest relatives, revealed to them the indignities she had suffered, entreating them to avenge her wrongs, at the same time declaring that she was resolved to expiate her own fault by a voluntary death. To their intreaties, their arguments, and remonstrances, she turned a deaf ear, and while they were inventing new reasons why she ought to live to bear testimony against the monster, she drew a dagger that she had concealed for the purpose, and plunged it into her heart. Historians have given the accounts somewhat different; our account is that of Livy, but all agree that the melancholy catastrophe was the immediate cause of the expulsion of the Tarquins, and the change of the Roman form of government.

LUCRETIVS, TITUS CARUS, a celebrated Roman poet and philosopher, born about the year 96 B.C., was sent at an early age to Athens, where he is said to have studied under Zeno and Phaedrus. Here he imbibed the philosophical tenets of Epicurus and Empedocles, which, at that period, prevailed at the great seat of Greek learning; these and other doctrines, popular among the literati, he afterwards explained and elucidated in his celebrated work, entitled "De Rerum Natura;" it contains, in fact, the first complete and accurate statement of the Epicurean philosophy in the Latin language. In this poem the writer has controverted all the popular notions of heathenism, and even those points which are fundamental in every system of religious faith, the existence of a first cause, by whose power all things were and are created, and by whose providence they are supported and governed. Nevertheless, the masterly genius and unaffected elegance of the poet are every where conspicuous; his language and versification sometimes partake of the rudeness of an early period of literature, and in the argumentative parts of his work, the poet is frequently difficult to be understood; but where the subject admits of elevated sentiment and descriptive beauty, no Roman poet has taken a better sight, or exhibited more spirit and sublimity; the same animated strain is supported almost throughout

out entire books. Virgil studied him, and has borrowed much of his diction. This poem was written and finished while the poet laboured under a violent delirium, occasioned by a philtre, which the jealousy of his mistress or his wife had administered. The morality of Lucretius is generally pure, but many of his descriptions are licentious. The absurdities and impiety of his philosophy cannot in this country, and in this age, be accounted dangerous; and persons of high integrity and the greatest respectability have become, in modern times, the editors and commentators of Lucretius's poem. The best editions are those of Creech, 8vo. 1695, Oxon.; of Havercamp, Lugd. B. 4to. 1725, and of the celebrated Gilbert Wakefield, Lond. 3 vols. 4to. The last is exceedingly rare, on account of the fire which destroyed the greater part of the impression. Mr. Good, the translator of the poem, and whose work was published in 1805, has taken advantage of this circumstance, and has given the entire text from Mr. Wakefield's edition, which had been collated and printed with the utmost care by that learned and much-to-be-lamented classical scholar. In the translation just referred to, there are, besides elaborate annotations, a critical account of the principal editions and translations of his author, a history of the poet, a vindication of his character and philosophy from vulgar misrepresentation, and a comparative statement of the rival systems of philosophy that flourished in the time of Lucretius. In this poem the translator imagines he has discovered the inductive method of the illustrious Bacon; part of the sublime physics of sir I. Newton, and various chemical discoveries of our own days, in a surprising degree anticipated, as to their principles and many important results.

LUCRINO, in *Geography*, a lake near Naples, anciently celebrated for its green oysters and other fish, separated from the sea by an artificial bank. In the year 1538, an earthquake formed a mountain near two miles in circumference, and 200 feet in height; consisting of lava, burned stones, scoria, &c. which left no appearance of a lake, but a morass filled with grass and rushes.

LUCULLEUM MARMOR, in the *Natural History of the Ancients*, the name of a hard stony kind of marble, of a good fine black, and capable of an elegant polish, but little regarded from its want of variegations. When fresh broken, it is seen to be full of small, but very bright shining particles, appearing like so many small spangles of tale. It had its name from the Roman consul Lucullus, who first brought it into use in that city. It is common in Italy, Germany, and France. We have much of it imported, and our artificers call it the *Namur* marble, the Spaniards call it marble of *Buga*.

LUCULLIAN GAMES, in *Antiquity*, were annual games decreed by the province of Asia, about the year 70 before Christ, in honour of the exploits of Lucullus.

LUCULLUS, **LUCIUS LICINIUS**, in *Biography*, a Roman commander, who has been celebrated for his fondness for luxury, as well as for his military talents, was born about the year 115 before the Christian era, and being well educated, he soon distinguished himself by his proficiency in the liberal arts, particularly in eloquence and philosophy. As a military man, he was first noticed with applause in the Marston war, and was, on account of his good conduct, made an edile. He was employed by Sylla in many important concerns, and during the siege of Athens was sent by that commander into Egypt and Lybia, to procure a supply of ships. With respect to king Ptolemy he was unsuccessful, but he pleaded the cause of his employer with more effect in other places, and collected a fleet, with which he gave two defeats to that

of Mithridates, and convoyed Sylla's troops from the Thracian Chersonesus. After the peace he was appointed quaestor in Asia, and praetor in Africa, in which offices he rendered himself illustrious by his love of justice, moderation, and humanity. He was raised to the consulship when he was about forty years of age, and entrusted with the care of the Mithridatic war; his first proofs were conspicuous in rescuing his colleague Cotta, whom the enemy had besieged in Chalcedonia. This was soon followed by a celebrated victory over the forces of Mithridates, on the borders of the Granicus, and by the conquest of all Bithynia. His victories by sea were as great as those by land, and Mithridates was driven with great loss towards Armenia, to the court of Tigranes, his father-in-law. His flight was quickly discovered, and Lucullus crossed the Euphrates, and gave battle to the vast army which Tigranes had assembled to support the cause of his son. It is not easy to give entire credit to the account of the numbers said to have been slain on this occasion, but the slaughter must have been prodigious, when Plutarch estimates that not less than 100,000 foot, and 55,000 horse soldiers lost their lives in this battle; and this at the expence of a very few Roman lives. Lucullus is represented by Plutarch as having paid much attention to dreams and auguries, yet he certainly exhibited, at the same time, an avowed contempt of vulgar superstition, for being admonished by some of his officers not to give battle on that day, being the anniversary of a great defeat sustained by the Romans from the Cimbri, he replied to the monitor, "I also will make this a day to be remembered by after-ages." The taking of Tigranocerta, the capital of Armenia, was the consequence of the victory, and Lucullus there obtained the greater part of the royal treasures. This continued success rendered the commander haughty and imperious, and his changed manners were offensive to the soldiers, and displeasing to those who adhered to the cause of Rome. He was accused in the senate with designedly protracting the war for his own emolument, and discontents proceeded so far that he was superseded, first by the consul Glabrio; after which Pompey was sent to succeed him, and to continue the Mithridatic war. His interview with Lucullus began with acts of mutual kindness, and ended in the most determined enmity. Lucullus was however permitted to retire to Rome, and 1600 soldiers, who had shared his fortune and his glories, were allowed to accompany him. At Rome he was coldly received, and he obtained with difficulty a triumph which was claimed by his fame, his successes, and his victories. This was the termination of his military glory, he retired to the enjoyment of ease and peaceful society, and no longer interested himself in the commotions which disturbed the tranquillity of Rome. He now adopted a life of luxurious profusion, scarcely paralleled by a private citizen in any age or country, but under the direction of a refined taste, and not excluding the rational pleasures of literature. He collected a splendid library, which he threw open to all persons of learning and curiosity. It was particularly the resort of the Greeks who visited Rome, and whom he treated with great hospitality, delighting to converse with them on topics of philosophy, with all the doctrines and sects of which he was thoroughly conversant. He was himself principally attached to the doctrines of the old academy, the defence of which is put into his mouth by Cicero, in a dialogue entitled "Lucullus." Toward the close of his life, Lucullus fell into a delirium, and he died in about the sixty-eighth year of his age, and was much regretted by the Roman people, who doubtless had tasted the fruits of his munificence: they would willingly have given him an honourable funeral

in the Campus Martius, but their offers were rejected, and he was privately buried by his brother at Tusculum. Lucullus has been admired for his many accomplishments, but he has been censured for his severity and extravagance. The expences of his table were immoderate; his halls were distinguished by the different names of the gods, and when Cicero and Pompey attempted to surprise him, they were astonished at the collinefs of a supper which had been prepared upon the word of Lucullus, who had merely said to his servant that he would sup in the hall Apollo. In his retirement Lucullus was fond of artificial variety; subterraneous caves and passages were dug under the hills on the coast of Campania, and the sea-water was conveyed round the house and pleasure-grounds, where the fishes flocked in such abundance, that at his death they were sold for a very large sum of money. Lucullus may rank among the great men of Rome, both for his civil and military qualifications. He was also estimable in many points of moral character; he was generous, humane, mild, and equitable. He was a perfect master of the Greek and Latin languages, and employed himself some time in composing a concise history of the Marfi in Greek hexameters. Such are the characteristics of a man who meditated the conquest of Parthia, and who might have disputed the empire of the world with a Cæsar or Pompey, if his fondness for retirement had not withdrawn him from the reach of ambition.

LUCUMA, in *Botany*, the Peruvian name of the Linnean *Achras qummeja*, which Juslieu has separated, under this appellation, as a distinct genus; chiefly, as it appears, on account of the flowers being pentandrous and five-cleft, and the corolla globose rather than bell-shaped. The seeds moreover are round or angular, not of that elliptical compressed form, with the peculiar long fear of attachment, which characterizes *Achras*; see that article. See also Juss. 152, and *Sapota Achras*, Gærtn. t. 104.

LUCY-LE-BOIS, in *Geography*, a town of France, in the department of the Yonne, and chief place of a canton, in the district of Avallon. The place contains 830, and the canton 7886 inhabitants, on a territory of 242½ kilometres, in 16 communes.

LUCZAY, a town of Lithuania, in the palatinate of Wilna; 16 miles S. of Bresslaw.

LUCZYNCZ, a town of Poland, in the palatinate of Bracław; 48 miles W.S.W. of Bracław.

LUDAIA, a town and district of the island of Java, near the S. coast.

LUDAMAR, a Moorish country of Africa, bounded on the N. by the Great Desert, on the E. by Bambarra and Beeroa, on the S. by Kaarta, and on the W. by Jaffnoo. It is governed by a Mahometan prince. The country is not fertile; the principal article of trade is salt, which they procure from the Great Desert, and exchange for slaves, to be disposed of to the Europeans. The capital is Benown, or Benown. N. lat. 15 to 16°. W. long. 5° to 8°. The Moors of this, and the other states adjoining the country of the negroes, resemble in their persons the Mulattoes of the West Indies, to so great a degree as not easily to be distinguished from them; and in reality, the present generation seems to be a mixed race between the Moors (properly so called) of the north, and the Africans of the south; possessing many of the worst qualities of both nations. By these Moors Mr. Park was taken captive, and confined for some weeks at Benown. See **MOORS**.

LUDDINGHAUSEN, a town of Germany, in the bishopric of Munster, on the Stever; 12 miles S.S.W. of Munster. N. lat. 51° 45'. E. long. 7° 36'.

LUDE, *LE*, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of La Fleche. The place contains 3018, and the canton 10,376 inhabitants, on a territory of 237½ kilometres, in 10 communes.

LUDENSCHEDE, a town of Germany, in the county of Mark, the principal trade of which consists in the manufacture of iron; 28 miles N.E. of Cologne. N. lat. 51° 8'. E. long. 7° 42'.

LUDER, a town of Germany, in the bishopric of Fulda, the seat of a jurisdiction; six miles W.N.W. of Fulda.

LUDGERSHALL, or **LUGGERSHALL**, a market and borough town in the hundred of Amesbury and county of Wilts, England. In the year 1800 this place contained 109 houses, and 471 inhabitants, most of whom are employed in agricultural pursuits. Ludgershall is a borough by prescription, and sent members to all the parliaments in the reign of Edward I. The returns were afterwards irregular, till the ninth year of Henry V., since which time it has continued to be represented by two members. Like the generality of small boroughs, this has occasioned some parliamentary investigation, and instances of bribery and corruption have been proved against its members. About seventy persons, who are freeholders, or lease-holders, in the borough, have the privilege of voting. The principal object of curiosity, or historical interest, in this town, is its castle; a small fragment of which only remains. According to a legendary account, but which is not entitled to much credit, this fortress was erected by king Lud, and thence obtained the name of Lud-gars-hall. Stow, in his Annals, relates that Richard I. gave this castle, with another at Marlborough, in the same county, to his brother John, in the first year of his reign. Gough, in his additions to Camden's Britannia, states that it belonged to "Geoffrey Fitz-Piers, the wealthy chief-justice of England, and earl of Essex." It was possessed by this family till the reign of Henry III., when Jolan de Nevill was appointed its governor. In the reign of Edward III. the manor, castle, &c. were vested in John, lord Molins, who obtained a grant from that monarch to impark the woods with 100 acres adjoining. See *Grove's Antiquities of England*, and Britton's *Beauties of Wiltshire*, vol. ii. p. 156, &c. West of this town is Chidbury, or Shidbury hill, said to be the highest eminence in Salisbury plain. Its summit is inclosed with an entrenchment, which is deep, and which Aubrey attributes to the Britons. From the top, a ditch extends down the northern slope, and terminates at the bottom, where the inequality of the ground shews that a permanent encampment, or town formerly existed. The open downs in this part of the county abound with barrows, or tumuli of various sizes, and encampments. See *Stukeley's Account of Stonehenge*, and *Hoare's Ancient Wiltshire*.

LUDHANA, a town of Hindoostan, in the circar of Sirhind, on the Settledge; 18 miles N.W. of Sirhind. N. lat. 30° 2'. E. long. 74° 57'.

LUDHOA, a town of Sweden, in East Botania; 36 miles S.E. of Brahestad.

LUDI CIRCENSES. See **CIRCENSES**.

LUDI Cereales. See **CEREALES**.

LUDI Florales. See **FLORALES**.

LUDI Juveniles. See **DECEMBER**.

LUDI Trojanæ. See **TROJANI**.

LUDIA, in *Botany*, from *ludo*, to sport. The name was given by Commerlon, as Juslieu informs us, because nature, to use a common expression, sports remarkably in the shape of the leaves; which in the young shrub are minute,

with spinous teeth, but in the adult one much larger, and entire.—Juss. 343. Lamarck Dict. v. 3. 612. Illustr. t. 466 Willd. Sp. Pl. v. 2. 1129.—Class and order, *Polyandra Monogynia*. Nat. Ord. *Rosacea*, Juss.

Gen. Ch. Cal. Perianth inferior, of one leaf, in from four to seven deep, nearly equal, roundish, spreading, fringed segments, permanent. Cor. none. Stam. Filaments numerous, thread-shaped, inserted into the receptacle, twice or thrice the length of the calyx; anthers roundish, of two lobes. Pist. Germen superior, sessile, ovate; style columnar, scarcely so long as the stamens; stigma obtuse, three or four-cleft, more or less deeply. Peric. Berry dry, globose, tipped with the permanent style, and standing on the rest of the deformed, permanent calyx, of one cell. Seeds numerous, somewhat angular.

ET Ch. Calyx in several deep segments. Corolla none. Stigma three or four-cleft. Berry dry, superior, of one cell, with many seeds.

Obs. This genus is evidently most nearly allied to *Prockia*, and wherever the latter is placed, in a natural or artificial system, this must go along with it. Both seem to belong to the *Leglandria*, but they have been universally classed in *Polyandria*. Jacquin indeed asserts that the stamens of his *Ludia tuberculata* are inserted into the receptacle; but, on the other hand, the *Prockia integrifolia*, Willd. Sp. Pl. v. 2. 1214, is as truly icelandrous as the strawberry or any other plant can possibly be, though Lamarck's figure, t. 465 f. 2, does not express it. He has, moreover, made the serratures of the leaves too strong, they being very shallow in the original.

1. *L. heterophylla*. Lamarck n. 1 t. 466. f. 1, 2.—Leaves of the adult shrub obovate, coriaceous, shining; of the young one sharply toothed. Stigma slightly notched.—Gathered by Commerçon in the island of Mauritius, where it is called *Bois sans ecorce*, or tree without bark. Lamarck describes and figures the young shrub with small roundish leaves, furnished with strong spinous teeth, somewhat like *Quercus coccifera*, or *Malspigia coccifera*. Jussieu also relates the same. We have seen no specimens in this state. Our's is an adult one, with coriaceous, obovate, obtuse or emarginate, entire, alternate leaves, an inch or an inch and half long, broad, veiny, and shining, paler beneath, on strong footstalks, half an inch in length; see Lamarck's fig. 1. We find no stipulas. The flowers are axillary, solitary or in pairs, on short, thick, scarred stalks, with numerous, minute, imbricated, roundish concave bractlets at the base of the stalks. The calyx is green, finely downy. Stamens long and slender. Style short, erect and thick, with a slightly notched, very little enlarged, stigma.

2. *L. myrtifolia*. Lamarck n. 2. t. 466. f. 3. —Leaves ovate, nearly entire. Style somewhat curved. Stigma with three notches.—Native of the isle of Bourbon.—This is what Jussieu intends when he says the leaves of the increasing shrub (in *Ludia*) are like myrtle or box, and entire; as however the specimens are in flower, Lamarck judged them to be arrived at perfection, and a distinct species from the above; especially as the style is somewhat incurved, and the stigma has only three notches, instead of four. We are totally unable to form any decided opinion on the subject. The leaves of the present plant are much smaller, thinner, and generally more pointed than in the former; but we perceive here and there among them rudiments of teeth, and minute spines, as if they were in a progressive state from one shape to the other. Neither are the differences indicated in the style and stigma very striking or decided. We are therefore not inclined to adopt the opinion of Jussieu, that the present is only the advancing, or first-flowering, state of the

above very extraordinary species. We have moreover a specimen, gathered by Commerçon in Madagascar, which is evidently intermediate in the form, margin, and texture of its leaves, betwixt this *myrtifolia* and the adult *heterophylla*.

3. *L. sessiflora*. Lamarck n. 3. (*L. tuberculata*; Jacq. Hort Schoenbr. v. 1. 59. t. 112.)—Leaves elliptic-lanceolate. Stigma deeply three-cleft.—Native of the island of Mauritius. It flowered under Jacquin's observation, in the stove at Schoenbrunn, in June and July, and formed imperfect fruit, which he thought did not agree with Jussieu's character, and which Willdenow has, from his figure, described as being, in this species, a berry of three cells, with solitary seeds. But we presume nothing can be judged from such an abortion. We should have preferred Jacquin's specific name to Lamarck's, as the flowers are rarely sessile, had it not been equally applicable to both the former. This is a small tree, with drooping, subdivided branches. Leaves scattered, stalked, more or less elliptical, but rather irregular in shape, coriaceous, veiny, smooth and shining, both sides nearly of the same hue. Flowers axillary, solitary; in our specimen nearly as much stalked as in the above. Calyx all over very downy. Germen large, and rather elevated. Style divided, almost half way down, into three blunt cloven stigmas.

LUDITZ, in *Geography*, a town of Bohemia, in the circle of Saatz

LUDLOW, EDMUND, in *Biography*, a distinguished leader of the republican party in the civil wars of Charles I., son of sir Henry Ludlow, knight, was born about the year 1620, and received his academical education at Trinity college, Oxford, whence he removed to the Temple to study the laws and constitution of his country. His father was representative for Wiltshire in the Long parliament of 1640, and having joined the party in opposition to the court measures, Edmund adopted the same principles, and entered into a military association among the students of law, with whom he joined the army as one of the life-guards of the earl of Essex. In this situation he was present at the battle of Edgehill, in which it appears that he endured much personal fatigue and suffering. Speaking of the night after the battle, he says, "No man nor horse got any meat that night, and I had touched none since the Saturday before; (this was Monday,) neither could I find my servant, who had my cloak, so that having nothing to keep me warm but a suit of iron, I was obliged to walk about all night, which proved very cold by reason of a sharp frost." And he farther adds, "when I got meat, I could scarcely eat it, my jaws, for want of use, having lost almost their natural faculty." Soon after this, Ludlow raised a troop of horse, which he commanded at the siege of Wardour castle. Of this fortress, when taken, he was made governor, and he held it ten months against all the efforts of the king's party, till it was battered to ruins. He was taken prisoner on its surrender, but was soon exchanged, and then appointed by the parliament sheriff of the county of Wilts. He took a commission under sir William Waller, was present at the second battle of Newbury, and at several other important actions, in which he displayed equal valour and good conduct. When the leaders of the presbyterian party were thrown out of power by the self-denying ordinance, Ludlow seceded with them, and remained without public employment till he was chosen, in 1645, knight of the shire for the county of Wilts, in the place of his father, who died two years before. At this period the plans of Cromwell began to be developed, and Ludlow was one of those who opposed them with the greatest firmness and openness. He appears to have acted with principle,

iple, and his measures were all the result of integrity and honour. He was one of the king's judges, and soon after that event, Cromwell, to keep him out of the way, caused him to be nominated lieutenant-general of horse in Ireland, and one of the commissioners for civil affairs. After the death of Ireton, the chief command of the army devolved on Ludlow, but as he continued to oppose the ambitious projects of the protector, he was, in a very short time, superseded. He was afterwards imprisoned, but being admitted into the presence of Cromwell, he vindicated his own conduct and the republican principles on which he acted with great freedom and presence of mind, and could not, by any means, be induced to make any engagement for future submission. When Richard was declared protector, Ludlow, with other republicans, joined the army party of Wallingford-house, and was instrumental in the restoration of the Long parliament, in which he took his former seat; was appointed one of the committee of safety, and had likewise the command of a regiment. He was again sent to Ireland as commander-in-chief of the forces there, and his first care was to fix the officers in the interest of parliament. When he found things taking a decided turn towards monarchy, he hastened to London with a view of preventing this change, and when he found the effort hopeless, and that the tide of public inclination in favour of a king was irresistible, he began to consider of his own safety. His name was not among the seven excepted in the bill of indemnity; nevertheless, the proclamation respecting the person who sat in judgment on the late king Charles filled him with just apprehension, and notwithstanding the remonstrances of his friends to the contrary, he determined, as his safest course, to withdraw from the kingdom. He landed at Dieppe in 1665, whence he proceeded to Geneva, where he was joined by two other persons who had likewise been judges of the late king, but thinking themselves not sufficiently secure they withdrew into Switzerland. Even here, the vengeance of the royal family pursued the regicides, some of whom were actually assassinated by the agents of the English government; an attempt was made against the life of Ludlow, but being discovered, he evaded the blow, and passed the remainder of his life in the neighbourhood of Berne, highly respected and esteemed by the magistrates and people of that city, as well for his private virtues as his public character. In 1689 he ventured to come over to England, and appear openly in London; but a motion being made in the house of commons for an address to the king to issue a proclamation for his apprehension, he returned to the continent, and closed his life in exile, at the age of seventy-three. A monument was erected to his memory, in the principal church at Vevay, by his widow, who had been the faithful and courageous partner in all his fortunes. Edmund Ludlow was undoubtedly one of the purest and most disinterested persons who flourished in those times. He was equitable and humane, calm and sedate, yet resolute; virtuous without austerity, and pious without fanaticism. His "Memoirs" were first printed at Vevay, in two vols. 8vo. 1698, to which, in the following year, another volume was added. They were reprinted in one volume folio, London 1751; to this edition was added "The Case of king Charles I.," drawn up by John Cook, solicitor to the high court of justice on his trial. In the same year, the work was printed in three vols. 12mo. at Edinburgh. An edition in 4to. was published in 1771. The "Memoirs" contain an account of the author's own transactions during the civil wars, and the subsequent period, together with many particulars relative to the general history of the times, written in a clear, interesting, and unaf-

fect style. Biog. Brit. Ludlow's Memoirs, three vols. 12mo.

LUDLOW, in *Geography*, a market-town, situated in the hundred of Munslow, and county of Salop, England. It stands on an eminence at the junction of the rivers Teme and Corve, in a fertile and picturesque district, and commands a variety of beautiful prospects. The ancient British name of this place was *Dinan Llys Tywysog*, or the *Prince's Palace*. Hence it is supposed to have been the residence of some prince of the country, prior to the subjection of Wales by Edward I. This town extends about a mile in length, and in its broadest part is somewhat more than half a mile in that direction. It was formerly surrounded by a wall, some part of which is still standing, but in a state of great dilapidation. Towers were placed at certain distances, and there were formerly seven gates, of which only one now remains. The streets are mostly wide, and well paved, and lie in a diverging and inclined direction from the highest or central part of the town. The houses, in general, present rather an elegant appearance, and are more regularly disposed than in most inland towns of the same antiquity. They are chiefly occupied by families of independent fortune, who are attracted by the healthful situation of the place. Glazes constitute the principal manufacture, besides which, however, there is a considerable trade in the tanning, timber, and cabinet-making lines. A number of persons are likewise employed in the various branches of mechanism. There are four markets during the week, but the most important one is held on Monday, and is well supplied with every article necessary for the support of man.

Ludlow, according to the parliamentary returns of 1801, contained 804 houses, and 3897 inhabitants. It was incorporated by charter in the reign of Edward IV. The government is now vested in a recorder, two bailiffs, two capital justices, twelve aldermen, twenty-five common councilmen, a town clerk, a coroner, and several other inferior officers. The election of the bailiffs is usually attended with a degree of magnificence and splendour far surpassing the same ceremony in other towns of similar extent. The quarter-sessions are held here before the recorder and justices of the town, who, in former times, had the power of inflicting capital punishments, but all criminals liable to death are now removed to the county gaol at Shrewsbury. There is a court of record every week, in which the recorder and bailiffs sit as judges. This place sends two members to parliament, who are chosen by the common burgesses, amounting to about 500 in number.

Several of the public buildings of Ludlow are remarkably neat structures. The church, situated in the highest portion of the town, is a very spacious and elegant edifice, in the form of a cross, and seems to have been built in the reigns of Henry VII. and VIII. In the centre rises a lofty square tower, embattled at the top, and very handsomely embellished. This tower adds in no small degree to the beauty of many of the views from the neighbouring country. The principal entrance to the church is under a large hexagonal porch. The nave is divided from its aisles by six lofty pointed arches on each side. The choir is of large dimensions, and lighted by five lofty pointed windows on each side, and one at the east end, which occupies the whole breadth, and nearly the whole height of the choir. This great window is entirely filled with painted glass, representing chiefly the legend of St. Lawrence, the patron saint of the church. On each side of the choir stands a chantry chapel. That on the north exhibits some very splendid remnants of painted glass, portraying the story of the ring presented by some pilgrims to Edward

Edward the confessor; which pilgrims the legend recites were *men* of Ludlow. The whole of this noble church is coiled with fine oak, and embellished with carving. It is 228 feet in length, and 73 in breadth. In the chancel are many fine monuments of the lords presidents of the council of Wales, who resided in the neighbouring castle. A variety of tombs likewise appear in the church-yard, adjoining to which stands an alms-house, founded in 1486, by Mr. John Hoffer, merchant, for aged widows and widowers, and rebuilt by the corporation in 1758. Another alms-house, situated at the bottom of Corve street, was founded in the year 1590. The grammar-school, erected by Edward IV. in Mill-street, is a very excellent institution, where both the ancient and modern languages are taught. Nearly in the centre of the town, at the top of Broad street, stands the cross, a handsome stone building, with rooms over it used as a public school. The market-house, in Cattle-street, is a large building; beneath which is an area, serving as a corn-market, and the upper rooms, which are very extensive, are used for corporation meetings, balls, assemblies, &c. The guild-hall, where the quarter sessions, &c. are held, is a neat, commodious, modern structure, and to the west of the church stands a range of buildings, called the College. There is likewise a prison, named Goalford's tower.

But the object of greatest interest in Ludlow, and that to which it owes its celebrity and importance, is its castle, which stands on a bold wooded rock at the north-west angle of the town. It was founded, according to the generally received opinion, by Roger de Montgomery, about the year 1130, though some writers maintain it to be of earlier origin. Much, however, was added by others at different periods, particularly by sir Henry Sidney. Robert de Belesme, grandson of the founder, having engaged in rebellion against Henry I. it was seized by that monarch. The castle, now made a princely residence, was greatly augmented in the strength of its fortifications, and supplied with a numerous garrison. In the reign of king Stephen it was besieged in consequence of the governor, Gervas Paganel, having been induced to espouse the cause of the empress Matilda. With respect to the event of the siege, different accounts are handed down to us by historians, some asserting that the king succeeded in reducing it, and others, that finding it impregnable, he was compelled to abandon the attempt. Speed says, that the governor, repenting of his conduct in withdrawing from his allegiance, proposed a capitulation highly advantageous to the garrison, which was joyfully accepted. During this siege, Stephen gave a signal proof of his personal bravery, in rescuing prince Henry of Scotland, who had advanced too near the walls, and had been caught from his horse by a grappling iron, fastened to the end of a rope. In the troublesome reign of Henry III. the ambitious Simon Montfort, earl of Leicester, seized upon this castle, in conjunction with Llewelin. From this period nothing remarkable happened till the time of Henry VI. when it was held by Richard duke of York, who laid claim to the crown. Having assembled an army of ten thousand men in the Marches, he drew up a declaration of allegiance to the king, pretending that this large army was only raised for the security of the public peace. Time, however, disclosed the perfidy of his views; for no sooner was he informed of the defeat of lord Audley at Bloreheath, but he threw off the mask, avowed his pretensions to the throne, and appointed the castle of Ludlow as a place of rendezvous for his adherents. Upon this, the king's forces advanced to Ludford, a vill at a little distance from hence. The king's troops preparing for the attack, the duke's forces

began to disband. Sir Andrew Trollop likewise went over to the royal standard with a large body, whereupon the duke and his two sons, with the earl of Warwick and other chiefs, fled with precipitation. Edward, his eldest son, obtained possession of Ludlow in the course of the war, and upon his accession to the throne repaired it, and made it the court of his son the prince of Wales. Here the latter, after his father's death, was proclaimed king before he removed to London, at the instigation of his uncle, Gloucester, whose barbarous usurpation is not paralleled in the annals of England. Arthur, son to Henry VII. fixed his residence at this castle, and held a court here with vast splendour and magnificence after his marriage with Catharine of Arragon, afterwards the wife of Henry VIII. At this time the court of the Marches for the principality of Wales was established here, and continued for many years with much grandeur and solemnity. The power of this court was very extensive, and consisted of a lord-president, as many counsellors as the prince pleased, a secretary, an attorney, a solicitor, and four justices for the counties of Wales. King Charles I., when prince of Wales, visited this castle. It was next distinguished by the representation of the celebrated Masque of Comus in 1634, during the presidency of John earl of Bridgewater. This exquisite effusion of Milton's genius was founded on a real incident. The two sons of the earl, and his daughter lady Alice, being on their way from a house belonging to their family in Herefordshire to Ludlow,

"To attend their father's state
And new intrusted sceptre,"

were benighted in Haywood forest, where the lady was lost for a short time. The adventure being related to the earl on their arrival at the castle, Milton, at the request of his friend Mr. Henry Lawes, who taught music in the family, wrote the Masque. Lawes set it to music, and performed the character of the attendant spirit; the lady herself playing the part which she had already acted in real life. The patronage afforded to the muse of Milton, at this period, by the earl of Bridgewater, does great honour to that nobleman.

During the civil wars in the reign of Charles I. this castle was for some time kept as a garrison for the king. In 1645, a small part of the royal army was defeated in this neighbourhood, and on the 9th of June, in the following year, the fortress was surrendered to parliament. After the restoration, the celebrated Samuel Butler, secretary to the earl of Carbery, then appointed lord president, wrote here a great part of his incomparable poem of Hudibras. From this period nothing remarkable happened till the reign of William and Mary, when the court of the Marches was dissolved by act of parliament, being, as therein recited, "a great grievance to the subject." After this event the castle gradually fell into decay, and was despoiled of its curious and valuable ornaments. In the days of its prosperity it seems to have been one of the most extensive and superb baronial fortresses in Europe. It commands grand and extensive prospects, and is strongly environed by embattled walls of great height and thickness, with towers placed at convenient distances. That portion of it which lies nearest the town, was likewise defended by a deep ditch. The whole was divided into two distinct parts or courts, one of which contained the palace and lodgings, and the other the court of judicature and records, stables, garden, and other offices. The former constituted what was properly denominated the Castle, and the latter was called the Green or Barbican.

bican. This noble fabric now presents a mass of magnificent ruins, retaining, however, ample assurances of its former glory. Of the chapel, a circular building, in the inner court, is all that remains. Over several of the stable doors the arms of Elizabeth and the earl of Pembroke are still visible, and over the inner gate of the castle are the arms of the Sidney family, with an inscription beneath. Along the sides of the eminence on which these splendid ruins are seated are some public walks, which were laid out in 1772, at the instigation of the counts of Powis. Part of Ludlow castle has been recently occupied by Lucien Buonaparte, his family, and suite, who are prisoners of war in this country.

The neighbourhood of Ludlow abounds with gentlemen's seats and agreeable villages. In the village of Bromfield are the remains of a cell of Benedictine monks, formerly belonging to the abbey of St. Peter, Gloucester. These ruins stand on a delightful situation within the grounds of Oakley park, the residence of the dowager lady Clive. Richard's castle lies about three miles from Ludlow. The town contiguous was originally called Gayton or Boytane, but the lustre of the castle afterwards eclipsed that name, and it is now called by the same appellation as the castle. This was once a place of considerable importance, as is evident from several old records prior to the time of Henry II. when it began to decay, in spite of the exertions of the noble family of Mortimer to support its declining state. Some part of the keep and walls of the castle are still remaining. About four miles N.W. of the town is Downton castle, the seat of — Knight, esq., brother to R. P. Knight, author of a poem called "The Landscape," and of several other literary productions. This gentleman built an irregular and singular mansion here, and called it a castle. He also laid out the grounds, immediately adjoining the house, in a style corresponding to his theoretical principles of the picturesque. On this subject both Mr. Knight and his friend Mr. Price have published some essays. The grounds and woods of this demesne are particularly bold, grand, and diversified. See the Ludlow Guide by J. Price, 18mo. 1797. Also an Historical Account of Ludlow Castle, &c. by W. Hodges, 1794.

LUDLOW, a township of America, in Hampshire county, Massachusetts, 90 miles W. of Boston; incorporated in 1784, and containing 650 inhabitants.—Also, a township on Black river, Windsor county, Vermont, containing 410 inhabitants, 10 or 12 miles W. of Weathersfield, on Connecticut river.

LUDOLF, Jon., in *Biography*, a learned orientalist, born in 1624 at Erfurt, in Thuringia, was educated in the university of his native place, paying particular attention to the study of jurisprudence and of the learned languages, especially those of the East. With the view of farther improvement he travelled into foreign parts, and was from home during six years, when he returned to Erfurt, where he exercised the functions of a counsellor for nearly twenty years of his life. He frequently assisted at the diets held upon the subject of the contentions between the dukes of Saxony and the archbishops of Mentz. At length, weary of public business, he obtained leave to retire, and chose for the place of his retreat the city of Frankfort on the Mayne: but scarcely had he settled his family, when the elector palatine placed him at the head of his finances. In his service he made two journeys to France, where he consulted the libraries of Paris, in order that he might make some advances in his favourite studies. At length he returned to Frankfort, and employed himself in finishing and revising the different works which he had composed. He died in 1704, universally esteemed; he has been characterized as equally fitted

for the dispatch of public business, and the retired pursuits of the closet. He was author of a great number of works, of which the principal are, "Historia Æthiopica," folio; "A Commentary on the same;" and an "Appendix." In these works the history, religion, and manners of the Ethiopians are detailed at length. He also published an "Abyssinian Grammar and Dictionary," folio; "Dissertatio de Locustis," folio; "Fasts Ecclesiae Alexandrinae;" "De Bello Turcico feliciter Consiendo." Moreri.

LUDOLF, HENRY WILLIAM, nephew of the preceding, was born at Erfurt in the year 1655. He was well educated, and was particularly instructed in the Oriental languages. He was a man well calculated for public business as well as deeply learned: he obtained the post of secretary to the envoy from Christian V. king of Denmark to the court of Great Britain, who recommended him to prince George of Denmark, by whom he was appointed secretary in 1686. This situation he held some years, till a very violent fever rendered him incapable of discharging its duties, when he retired with a handsome pension. As soon as his health would permit he set out on his travels to foreign countries. He first went to Russia, and having soon acquired its language, he met with a polite reception from the natives, and being a good performer in music, he had the honour of displaying his accomplishments in this art before the czar of Moscow, to the surprize and delight of that prince. The various knowledge which he discovered in his conversations with the Russian clergy led them to consider him as a prodigy of learning. He arrived in London in 1694, when he underwent an operation of cutting for the stone. Having recovered, he applied himself to the composition of "A Russian Grammar;" intended for the use not only of traders and travellers, but of the natives themselves, by exhibiting the principles of their language in a more regular form than had been laid down before. This work was printed at Oxford in 1696. Ludolf's curiosity led him next into the East, that he might obtain information concerning the state of the Christian church in the Levant. He arrived at Smyrna in November 1698, whence he went to Jaffa, from Jaffa to Jerusalem, and from thence to Cairo. As soon as Ludolf had returned to England, his reflections on the deplorable state of Christianity among those who professed that religion under the Turkish government, induced him to undertake an impression of the New Testament in the vulgar Greek, and to present it to the members of the Greek church. He was very desirous that the Protestant powers of Europe should establish a kind of college at Jerusalem, and that the persons selected for such an institution should not be devoted to the propagation of the peculiarities of any particular systems concerning which Protestants differ among themselves, but united by an agreement in the fundamental principles of the gospel, and by universal love and charity. In the year 1709, Ludolf was appointed by queen Anne one of the commissioners for managing the money collected for the relief of the Palatines, who had been driven from their native country. He died in 1710. He was author of several works besides his "Russian Grammar," which were collected and published in the year 1712. Gen. Biog.

LUDOLFFIA, in *Botany*, a genus of Adanson's, (Familles des Plantes, v. 2. 244.) named by him after Michael Matthias Ludolff, author of a catalogue of the plants of the garden at Berlin, where he was professor of Botany and Materia Medica, and where his book was printed in 1746. He published also a German Pharmacopoeia in 1734; and wrote on the subject of botanical classification, in the Mem. de l'Acad. de Berlin for 1745, where, according to Haller, he rejects the flammens as well as the cotyle-

cotyledons for the purposes of arrangement. We have not seen this treatise. What he offers relative to this matter and others, at the end of his work first mentioned, gives no exalted idea of his judgment. The above name has never been established, the plant of Adanson being esteemed a *Tetragonia*. It is curious that Boehmer, in his dissertation upon plants named after botanists, supposes the *Ludolfia* to have been called after Job Ludolf, author of the *Historia Ethiopiae*, being ignorant, as it seems, of the existence of the Berlin professor; but we can have no doubt that Adanson meant to commemorate the latter.

LUDSCHEN, in *Geography*, a town of Prussia, in Oberland; 7 miles E.S.E. of Marianwerder.

LUDSWIGSBURG, a town of Wurtemberg, containing two churches, one for Roman Catholics and another for Lutherans, and a fine picture gallery, a pleasant garden, and an old castle. The manufactures of this place are cloth, damask linen, and marble paper: 16 miles S. of Heilbronn. N. lat. 48° 54'. E. long. 9° 18'.

Though Stuttgart was in 1772 the nominal capital of the duchy of Wurtemberg, it had not, for the preceding ten years, been the residence of its sovereign. And though the operas and musical establishments of this prince used to be the most splendid in Europe, during the seven years' direction of Jomelli, they were, at the time just mentioned, but the shadow of what they had been. In Burney's German Tour, there is a list of his serene highness's musical establishments, at their most flourishing time, as well as at that of their declension.

In 1771 he had two new serious operas, the one composed by Jomelli, and the other by Sacchini, entirely at his own expence. The theatre is immense, and is open at the back of the stage, where there is an amphitheatre in the open air, which is sometimes filled with people to produce effects in perspective. It is built, like all other German theatres, on the Italian model.

The prince who reigned in 1772 was himself a good harpsichord player; Emanuel Bach dedicated to his highness the best book of six sonatas which he ever composed, printed at Nuremberg. At one time this duke had in his service three of the greatest performers on the violin in Europe; Ferrari, Nardini, and Lolli: on the hautboys, the two Pla, and Schwartz, a famous bassoon, with Walther on the French horn, and Jomelli to compose, for the best serious and comic singers of Italy. At Solitude, a favourite country palace, a conservatorio was established for the education of two hundred poor and deserted male children of promising talents; of these a great number were taught music, and from these his highness had already drawn several excellent vocal and instrumental performers for his theatre; some were taught the learned languages and cultivated poetry; others were initiated into the practice of the stage, as actors and dancers. At Ludwigsburg there was a conservatorio for a hundred girls, who were educated in the same manner, and for the same purposes. The building constructed at Solitude for the reception of the boys, has a front of six or seven hundred feet. It used to be the favourite amusement of the duke to visit the school, to see the children dine and take their lessons.

LUDUS HELMONTII, so called from Van Helmont, who extolled its medicinal virtues, in *Natural History*, an opaque fossil of an irregular shape, but of a very regular and singular internal structure. It is of an earthy hue, and always divided into separate masses, by a number of veins of a different colour, and purer matter than the rest. These masses, into which it is divided, are sometimes small and pretty regularly figured; in which case, they are called *talli*

or *ludi, dice*; but they are more frequently of no regular shape at all. There are others of them crullated, or composed of many coats, disposed one over another about a central nucleus. In these the *septa*, or dividing veins, are very thin and fine, in the others thicker.

These septa were used in medicine, being given in nephritic complaints, as it has been said, with success: the dose from a scruple to a drachm.

LUDWIG, CHRISTIAN THEOPHILUS, in *Biography*, was born in Silesia in 1709, and educated for the medical profession. Having a strong bias towards natural history, he was appointed to accompany Hebenstreit in his expedition to the north of Africa. (See *HEBENSTREIT*.) Soon after his return in 1733, he became Professor of Medicine at Lipsic. The first thesis defended there under his presidency, in 1736, related to the manner in which marine plants are nourished. These he shewed to differ essentially from the generality of the vegetable kingdom, as not deriving their nourishment by the root. In 1737 he published a *Programma* in support of the doctrine of the sexes of plants, from his own observations upon the date palm. Two years afterwards he, nevertheless, advanced some objections to the Linnæan system of arrangement by the organs of impregnation, under the title of *Observations in Methodum Plantarum Sexualem Cel. Linnæi*. This work begins with much just commendation of Linnæus, and even with great admiration of his system; accompanied however by an attempt at depriving him of the merit of originality, by insinuating that this system had been "indicated by others;" without saying by whom. These words are underlined by Linnæus in his own copy of the dissertation. They are as little to the purpose as the similar charge of plagiarism brought against the immortal Harvey. He proceeds to detail various difficulties and mistakes, which occurred to him in his scrutiny of this system, some of which relate to matters of opinion, others to anomalies or variations in Nature herself. His remarks however are free from asperity or illiberality. He chiefly fails, in point of judgment, when he blames Linnæus for making any particular character important in one genus or family, and not in all; not perceiving that the very essence of skill, in technical discrimination and arrangement of natural productions, consists in discovering, in each particular case, what is the most essential for the purpose in view. We do not see why his dissertations, "*de minuendis plantarum generibus*," published in 1737, and "*de minuendis plantarum speciebus*," in 1740, should be deemed inimical to Linnæus, to whom he gives full credit for having established the surest principles for the advancement of botany, though he criticises him here and there in the detail of their application. He also wishes to indicate some sources of discrimination, which Linnæus has less regarded, for the accomplishment of the same objects; particularly mentioning the anatomy of plants. He points out the colours of flowers as sometimes affording permanent specific distinctions, though Linnæus has in general discarded them from his characters. It must be allowed that Ludwig, in this and other instances, seems prompted by a desire to differ and to find fault; for Linnæus himself founds his primary divisions of species in *Mesembryanthemum* and *Cnaphalium*, no matter whether judiciously or not, upon this very circumstance. Such critics however are useful to science, as they promote enquiry and examination. Ludwig justly blames Linnæus for confounding the bulbous *Fumaria* as one species, and he may also be correct in some other remarks. The late lord Bute has well observed, that Ludwig, like Haller, was only a Linnæan in disguise, having frequently applied principles in unison with his, if not imbibed from him,

him, to build systems, and to exercise criticism, against him. Ludwig, in 1756, 1758, and 1759, published three dissertations on the colours of flowers, tending to shew their variableness! If he has in one instance suggested an example to the contrary, he is in that surely most unfortunate. Haller says he points out the *Fraxinella* (*Dictamnus albus* of Linnæus) as a case in which colour makes a specific difference. As this plant is frequently raised from seed, and the progeny differs, under every body's eyes, in having some white-flowered plants, perhaps in every crop, we presume the question may be readily decided; whether the lesser White *Fraxinella*, figured in Rivinus, Fl. Pentap. Irr. t. 135, be a distinct species, of which we see little probability, or a variety in size as well as colour. Rivinus himself says the common one, t. 134, is either red or white.

Ludwig published in 1737 his *Definitiones Plantarum*, in 8vo. for the use of his pupils. In this the genera of plants are arranged in a method supposed to be natural, founded on the corolla in the first place, the subordinate characters being taken from the fruit. The generic distinctions are derived from the herbage, flower, smell, taste, colour, or any thing that came in the author's way; certainly with no advantage whatever over the laws and practice of Linnæus, but rather evincing, at every step, the superiority of the latter to the vague scheme of his opponent. In another little volume of Ludwig, the *Apherismi Botanici*, published in 1738, the assertion of his being "a Linnean in disguise" is strongly justified. In vain does the writer try to forget the *Philosophia Botanica*, and to seek originality, at any rate, by wandering from its light. In vain does he extol the system of Rivinus in preference to all others. He is brought back by his own judgment, in spite of himself, at every step; and as he could never give the least degree of popularity to the system he extolled, the slightest study of his works will shew it to have been a mill-stone about his own neck. Boehmer gave a new and improved edition of the *Definitiones Plantarum* in 1760. Whether any use is made of this work at present, among the various botanical schools on the Continent, we have never heard, but we believe it has fallen into oblivion.

In 1742, and again in 1757, our author published his *Institutiones Historico-Physicæ Regni Vegetabilis*, in 8vo.; still in pursuit of novelty rather than of truth, he rejects the Linnean distinctions between animals and vegetables, founding the characteristic mark of the latter on the supposed propulsion of their fluids through a cellular texture, and not through a vascular system as in animals. This distinction is now known to have no foundation. In this work at length even the disguise of a Linnean is almost laid aside, a system of arrangement being proposed in which the stamens and styles make an essential, if not a leading, feature. The favourite old system of Rivinus still takes precedence, though it serves only as an additional impediment in the way of natural affinities, which defect is in some measure concealed by the primary characters not being strictly followed. Thus, though *Eryngium* is violently separated by its inflorescence from its natural allies, *Ilex* is silently left amongst the *Tetrapetalæ regulares*. The *Umbellati* are kept together by their inflorescence, in spite of the diversity of their flowers, as to regularity or irregularity; a difficulty which Rivinus had previously been obliged to overlook. It is remarkable that our author, in thus professedly adopting the principles of Rivinus and Linnæus combined, and disclaiming as he does, p. 86, all pretensions to originality, never mentions those persons from whom he had long ago asserted that Linnæus borrowed his system. This volume may therefore be considered as a tacit tribute of respect to

the illustrious Swede, arising from its author's progress in judgment and experience. He had no motive to withhold this tribute, as Linnæus never resented nor repelled his attacks. The latter says in a letter to Haller, "I have read the Characters of Dr. Ludwig entirely through. He has given very great attention to the subject; but I with the authors whom he chiefly follows may not have led him astray. All that comes from Boerhaave is not oracular. I every day augment or correct my own characters, which are nothing but generic descriptions, and therefore differ from those of Ludwig and Tournefort, as a specific name (or definition) differs from the description of a plant. Both are necessary in Botany." *Epist. ad Hallerum* v. 1. p. 12. We give this passage entire, because Haller in his index says Linnæus here "carps at Ludwig," than which surely nothing can be more unjust.

Our author began, in 1760, to publish impressions, chiefly of medicinal plants, taken from the dried specimen with printer's ink, or with smoked paper, in folio, under the title of *Etypha Vegetabilium*, which he continued from time to time. Such impressions give undoubtedly a correct outline, at least if the plant be fully displayed, but the rest is a mass of confusion; especially as the more elevated parts, which should be light, are necessarily the darkest. He wrote also occasionally on medico-botanical subjects, as on the effects of extract of *Stramonium*, and of the *Belladonna*, or Deadly Nightshade, in the epilepsy. His opinion seems not to have been favourable of either.

Ludwig died at Leipzig in 1773, aged 64. He left a son named Christian Fredrick, born in 1751, who became Professor of Natural History in the same university, and is the author of various tracts on Botany, Anatomy, and Physiology.—Ludwig's Works. Hall. Bibl. Bot. Dryandr. Bibl. Banks. S.

LUDWIGIA, in Botany, named by Linnæus in honour of Christian Theophilus Ludwig, Professor of Medicine in the university of Leipzig. (See the preceding article LUDWIG C. T.) Linn. Gen. 60. Schreb. 83. Willd. Sp. Pl. v. 1. 672. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 1. 205. Juss. 319. Lamarck Illustr. t. 77. Gærtn. t. 31.—Class and order. *Tetrandria Monogynia*. Nat. Ord. *Calycaethæzæ*, Linn. *Onagres*, Juss.

Gen. Ch. Cal. Perianth superior, of one leaf, permanent, cloven into four, lanceolate, widely spreading segments, equal in length to the corolla. Cor. Petals four, inversely heart-shaped, flat, greatly spreading, equal. Stam. Filaments four, awl-shaped, erect, short; anthers simple, oblong, erect. Pist. Germen inferior, quadrangular, clothed with the base of the calyx; style cylindrical, as long as the stamens; stigma slightly four-sided, capitate. Peric. Capsule of four valves, the partitions opposite to the valves. Seeds numerous, small. Recept. columar, membranaceous, four-winged; wings at the angles of the partitions, bearing seed at each side.

Ess. Ch. Corolla of four petals. Calyx four-cleft, superior. Capsule square, inferior, of four cells, and many seeds.

1. *L. alternifolia*. Linn. Sp. Pl. 173. Trew. Rar. p. 2. t. 2. (*Lythmachia non papposa*, flore luteo majore; Pluk. Alm. t. 203. f. 2.)—Leaves alternate, lanceolate. Stalks axillary, single-flowered. Stem erect, angular. Calyx-leaves remarkably large.—Native of Virginia, and sent from thence, to Miller, by Dr. Dale before 1752. It flowers in June and July.—Root annual. Stem about a foot high, upright, branching. Flowers solitary, small and yellow, situated at the base of the leaf-stalks.

2. *L. kirilowii*. Willd. n. 2. Lamarck Dict. v. 3. 614.—Leaves

Leaves alternate, lanceolate. Flowers axillary, solitary, nearly sessile. Stem round, diffuse.—A native of South Carolina.—Lamarck observes that this is very nearly allied to the last species in the form and arrangement of its leaves. The whole plant however is hairy. Stem woody, cylindrical, branched. Leaves alternate, oblong-lanceolate, entire. Flowers solitary, axillary, on such short stalks as to be nearly sessile, furnished at their base with two opposite, very long bractæas. Fruit less angulated than in the other species.

3. *L. jussiaeoides*. Willd. n. 3. Lamarck Dict. v. 3. 614.—Leaves alternate, linear-lanceolate. Flowers axillary, solitary. Germen very long.—A native of marshy ground in the Isle of France.—This is said particularly to resemble *Jussiaea* in its habit, whence the specific name.—Stem about a foot and half high, shrubby, branched. Leaves alternate, scattered, pointed, entire. Flowers solitary. Petals yellow, the length of the calyx.

4. *L. oppositifolia*. Linn. Syst. Veg. ed. 14. 161. Willd. n. 4. (*L. perennis*; Linn. Sp. Pl. 173.)—Lower leaves opposite, lanceolate. Stem diffuse.—A native of the East Indies.—Stems procumbent, six or eight inches long. Branches nearly all radical. Leaves smooth, entire, striated, three or four pair of the lower ones only opposite, the rest alternate. Flowers yellow. Petals shorter than the calyx.

5. *L. erigata*. Linn. Syst. Veg. ed. 14. 161. Mant. 40. Willd. n. 5. (*L. triflora*; Lamarck Dict. v. 3. 615.)—Leaves opposite, lanceolate. Stem erect.—A native of the East Indies.—Root annual. Stem a foot high, herbaceous. Leaves on footstalks, quite entire, smooth. Flowers so small as to be scarcely visible.

L. repens, Swartz Ind. Occ. v. 1. 273, proves, by a specimen from himself, to be *Iguardia palustris* of Linnæus, as Willdenow mentions.

Michaux, in his *Fl. Boreale Amer.* v. 1. 87, defines nine species as natives of North America, chiefly Carolina, of none of which we have any precise information. They are called *nitida*, *pedunculosa*, *microcarpa*, *angustifolia*, (which he supposes to be *ramosissima* of Walter,) *jussiaeoides*, (taken for *decurrens* of Walter,) *macrocarpa*, (which is the *alternifolia* of Linnæus,) *virgata*, *mollis*, and *capitata*. The last is said to be *jussieuifolia* of Walter.

LUDWIGSBURG, in *Geography*, a town of Anterior Pomerania, on the coast of the Baltic; five miles E.N.E. of Griefswalde.

LUDWIGSTAT, a town of the principality of Culmbach; 13 miles S. of Saalfeld.

LUDWIGSTEIN, a town of the principality of Hesse Rhinels; 14 miles E. of Cassel.

LUDWIGSTHAL, a town of Wurtemberg, famous for its iron forges; about one mile from Duttlingen.

LUDWIGWALL, a town of Prussia, in Natangen; four miles S. of Königsberg.

LUC, ST., the chief town of the captainship of Petagues, in the north division of Brasil.

LUES, in a general sense, is used for a disease of any kind.

LUES, in a more particular sense, is restrained to contagious and pestilential diseases.

LUES *Veneræ*, the venereal disease; called also *morbus gallicus*, *syphilis*, *morbus neapolitanus*, *morbus aphrodisius*, &c. In French, *la maladie vénérienne*, or *la verole*, or *grande verole*; in German, *huss-uche franzosen*.

The venereal distemper arises from a peculiar and specific morbid animal poison, which, when applied to the human body, is capable of producing both local and constitutional effects, such as primary sores or chancres, buboes, spots on

the surface of the body, nodes, ulcerations of the throat, pains in the bones, secondary ulcers, &c. Excepting chancres, none of these complaints can occur, unless some of the syphilitic virus has been taken up, and conveyed into the constitution by the absorbents proceeding from the primary sore, or surface originally infected. The venereal poison affects the human species alone, and has not the property of imparting the disease to any other animals. When applied to the human body, "it has the power of propagating or multiplying itself;" that is to say, it gives rise to a sore, from which is secreted matter containing a virus of the same specific nature. Of its appearance in an unmixed state we really know nothing; for we never see the poison in any other form than that in which it is blended with fluid matter. Its general properties are equally unknown; so that, if we put out of consideration its peculiar and remarkable effects on the human body, our ignorance of its nature is complete. It is not contagious through the medium of effluvia, or any volatile invisible matter in the air, the infection never being communicated, except by actual contact. The virus must be applied to a part of the body; the usual local effect is a particular sore, called a chancre; and some of the poisonous matter at length being imbibed by the absorbents, buboes, eruptions, &c. follow. Many cases seem even to prove that the poison may be absorbed from the skin, and buboes and constitutional symptoms take place, without the occurrence of any primary sore at all in the part to which the infectious matter was first applied.

Before entering into a more detailed account of a distemper which, as being a kind of scourge to illicit pleasure, and a curb to the most impetuous of passions, has made the generality of mankind very feelingly interested in the subject, we shall solicit the reader's attention to a point that is in the highest degree curious, and has afforded matter for numerous disputations.

Of the first Origin of the Venereal Disease.—Several writers have endeavoured to prove the great antiquity of this distemper. The principal of these are, Mr. William Becket, whose papers are contained in the 30th and 31st vols. of the Philosophical Transactions; Dr. Charles Patin, and Dr. Sanchez, authors of dissertations on the origin of the disease. The opinion has even been maintained, that the venereal malady has existed from time immemorial, and passages in support of this sentiment are referred to in Hippocrates, Galen, Avicenna, Celsus, and likewise the holy scriptures. "The Lord shall smite thee in the knees, and in the legs, with a sore botch, that cannot be healed, from the sole of thy foot unto the top of thy head." (Deuteronomy, chap. xxviii. ver. 35.) This, and many other ancient quotations, however, cannot be received as proofs, that syphilis was the affliction alluded to, because the leprosy, elephantiasis, and several other diseases, attended with ulcers, or eruptions, might be signified, as far as a judgment can be formed, from the words actually employed. (See Lombard sur la Mal. Vénérienne, tom. i. p. 39.) That the Greeks and Romans were at all acquainted with the venereal disease seems extremely improbable, and is an assertion quite unestablished. As Dr. Adams has well observed, the ancient physicians, being ignorant of the medical powers of mercury, must have been infinitely more familiar with every form of the disease than ourselves. Yet, till near the close of the 15th century, we have no description of local appearances that can be mistaken for venereal; and during the following century, the industrious Astruc enumerates more than one hundred writers on the subject. If other proofs are required, let us mark the difference between the licentious

licentious poets of former times and our own. Can a reader of common sense suppose that Horace, Juvenal, Persius, or Ovid, could have been silent on a subject so perpetually occurring in the satirical writings of Pope and Swift? On Morbid Poisons, p. 88. edit. 2.

But though it must be owned that the attempts to trace the existence of the venereal disease as far back as the times of Moses, and of the Greeks and Romans, have entirely failed, we must not infer that the people of those remote periods were not subject to maladies of the generative organs. Celsus has expressly treated of such complaints, and they probably afflicted mankind at a much earlier period than the reign of Augustus. The ancients were certainly liable to sores on the genitals; but these ulcers, like many which are met with at the present day in the same situation, were not syphilitic, notwithstanding they might sometimes put on a very bad aspect.

Giving up the supposition of lues venerea being of such antiquity, still it is contended that the disorder prevailed in Europe long before the return of Columbus from his voyage to America, or Charles VIII. besieged Naples; two events which happened at the close of the 15th century, when it is commonly thought that the disease first began its ravages in Spain and Italy, and thence spread to other parts of the old world. We are told that Gulielmus Salicetus, who practised at Verona in 1210, was well acquainted with the cause and effects of syphilis, and, in confirmation of this remark, we are referred to his work on surgery, where may be found a chapter, intitled, "De pustulis albis, et scissuris et corruptionibus quæ fiunt in virga et circa præputium, propter coitum cum meretrice, vel alia causa." Gordon, who lectured on physic at the university of Montpellier in 1289, mentions, in chap. 5, "De passionibus virgæ," the affections originating from connection with women whose wombs are foul, virulent, fanious, infectious, &c.; and he likewise specifies a remedy for a chancre proceeding from such a cause. See Lombard sur la Maladie Vén. tom. i. p. 40.

In the 30th and 31st vols. of the Philosophical Transactions, Mr. W. Becket published his papers in support of the antiquity of lues venerea. In his first dissertation, he labours to prove that a venereal gonorrhœa was known in England some ages before the year 1494, under the name of *ardor*, *arsura*, *incendium*, &c. in English, *brunning* or *burning*, of which, indeed, there is frequent mention made by British historians. In confirmation of this opinion, Mr. Becket produces authorities, of which some are earlier, and others later than the year 1494, the period when lues venerea is generally imagined to have first shewn itself in Europe.

The earliest of these authorities being the most material, will alone be noticed by us.

1. The first is a manuscript treatise of John Arden, an eminent surgeon in England, about the close of the 14th century. In this book mention is made of *burning*, which, according to Becket, is defined "a certain inward heat and excoiation of the urethra."

2. The second authority rests upon certain physical pieces supposed to have been written about the years 1390 and 1440. These works are said to contain some receipts for the cure of this *brunning*, both in men and women.

3. The third and last that we shall notice is founded upon the manuscripts, rules, and ordinances of the stewes, which were by public authority allowed to be kept at London, in the Borough of Southwark, under the controul of the bishop of Winchester. These documents are supposed to have been drawn up about the year 1430. One of them begins thus: "Of those, who keep women having a wicked infirmity," and further, it is ordered, under a severe penalty, that no

stew-holder keep any woman "wythin his hous that hath any sycknefs of brenning."

The celebrated Dr. Astruc, on the other hand, has deduced a different inference from these productions, without denying that they may be authentic; for he will not admit that this burning was the same disease as a venereal gonorrhœa, or that a venereal gonorrhœa was at any time expressed by such a term. His arguments are supported by considerations of the following kind.

1. The leprosy of the Arabians, which was formerly a common disease in England, as well as in other parts of Europe, was exceedingly contagious and infectious; and, therefore, lepers were, by several severe edicts, prohibited from having intercourse with the rest of mankind.

2. In case any person had carnal knowledge of a leprous woman, the leprosy was communicated to him by almost immediate infection. That the disease was thus imparted, is proved by Forellus, Obs. Chirurg. lib. iv. Obs. 8. Palmarius de Elephantiasi, cap. 2. Paræus, Op. lib. xx. cap. 8. Fernellius de Partium Morbis et Symptomatis, lib. vi. cap. 19. Valesius de Taranta, Philon. 7. cap. 39. Gordon's Lillii Partic. i. cap. 22.

3. When the case did not turn out to be leprosy in the worst form, yet the pudenda were for the most part affected with an inflammation, erysipelas, herpetic or miliary exulcerations, cuticular eruptions, &c.; whence arose a dysuria, called, in old language, *ardor*, *arsura*, *incendium*, *calcfactio*, and, in English, *brunning*.

4. In confirmation of this statement, Astruc cites Theodorici's Chirurg. lib. vi. cap. 55; a manuscript treatise on surgery, intitled Rogernia; Gilbert's Compend. Medicin.; Glanville's Breviarium Medicinæ, lib. ii. cap. 4; John of Gaddisden's Rosa Anglica, cap. de infect. ex concubitu cum leproso vel leprosa; and, lastly, John Manardus, of Ferrara, in Epist. Med. lib. vii.

5. All these writers describe the complaints caught by commerce with leprous women, and, on the whole, Astruc infers that the *burning*, or *brunning*, referred to by Mr. Becket, was the same disorder as, according to the doctor's authorities, might arise from connection with a leprous woman, or one who had lately cohabited with a leprous man. As for the *nefanda infirmitas*, mentioned in the laws of the stewes, Dr. Astruc conceives it must have been the leprosy itself. De Morb. Veneris.

We shall not follow these gentlemen through the whole of their arguments. The most important are set before the reader, and he must judge of them himself. That discharges from the urethra, attended with heat and pain in making water, must have existed from time immemorial, we decidedly believe; because experience has well proved that such complaints may often proceed from causes which are decidedly not venereal. Nay, it is even a question among modern surgeons, whether any claps at all originate from the same poison as lues venerea. This point, though so highly interesting, is far from being settled; and notwithstanding the sentiments of Mr. Hunter, we think the arguments and facts at present on record are rather more weighty in favour of the doctrine, that a gonorrhœa does not depend upon the same virus as syphilis. According to Fallopius, what has been called a venereal gonorrhœa did not shew itself among the symptoms of this disease before the year 1545, or 1546, that is, above fifty years after the period commonly assigned for the first eruption of syphilis. (Tract. de Morb. Gallico, cap. 23.) Supposing that a gonorrhœa really depended on the same infectious matter, is it credible that the complaint should never occur for half a century, during all which time chancres, and other venereal affections,

are known to have prevailed to a very great extent? As we shall be obliged to touch upon this subject again, and have already mentioned it in the article ΓΟΣΟΚΗΘΕΑ, we shall not pursue it at present. In our opinion, Becket has fully proved that inflammations, discharges, &c. existed long before the year 1494; but his evidence fails in establishing that they were actually venereal.

Astruc himself has very sensibly remarked, "that the genitals are no less subject to violent diseases than the other parts of the body, that they are equally exposed to all the causes of indisposition, and that they enjoy no prerogative above the rest to guard them against the attack of distempers. From the very infancy of physic, and long before the venereal disease was known, several writers have treated at large of an abscess, ulcer, cancer, and mortification in the genitals." (See Galen, lib. vi. de locis affectis, cap. 6, and Cornelius Celsus, lib. ii. cap. 1. lib. v. cap. 20. and lib. vi. cap. 18.) Astruc also quotes the historian Flavius Josephus, who, in his second book against Apion, related, that that vile slanderer of the Jews was afflicted with an ulcer in the penis, of which disease, after several incisions to no purpose, he died in exquisite torments, the genital parts being mortified. And again, (Hist. Jud. lib. xvii. cap. 8.) he says, that Herod, king of the Jews, died consumptive and convulsed, his private parts being putrefied and eaten up by worms. Astruc likewise quotes passages from Eusebius, Pliny, and other ancient authors, shewing, beyond all doubt, that complaints and diseases of the generative organs existed and prevailed in the earliest times. The phimosis, paraphimosis, and hyperærosis, or caruncle of the urethra, among other cases, were undoubtedly known to the Greek physicians; but then, these disorders proceeded from an ordinary cause, and not from any venereal contagion, as will be plain to any one who will take the trouble to consult the old writers.

Dismissing the idea of the venereal disease being so ancient as some have supposed, let us examine what grounds there are for believing that the close of the fifteenth century was the era, when the disorder first commenced its ravages in Europe.

The authorities in support of the opinion, that the venereal distemper first made its appearance in this quarter of the world towards the latter end of the year 1494, are the united testimonies of all the medical writers who at that time flourished in Italy, and who could not confound it with the leprosy, which, being then a common disease, was well known to them. The practitioners of that period were astonished at the novelty of the malady; and finding, from experience, that the medicines, which were usually given in analogous cases, proved ineffectual, were at a loss what method to pursue, and, for a time, gave up the treatment into the hands of quacks.

Joseph Grunpech, a German physician, published, in the year 1496, "Tractatum de Pestilentiali Scorra, sive Malade Frantzoz," in which he affirms, that it was a disease so lately inflicted on mankind, that it seemed to be a plague sent down from heaven; that it was a new kind of disease, hateful to nature, a most horrid and terrible prodigy, and altogether unknown to mortals before that time.

Alexander Benedict of Verona, who was physician in the Venetian army, which Charles VIII. of France destroyed in the battle of Fornova, in the year 1495, and therefore had the opportunity of observing the first appearance of this new disease, asserts in his work, "De omnibus Morbis," published in 1496, that, "by the venereal contact, a new French disease, or, at least, one that was unknown to former physicians, owing to the pestiferous aspect of the stars, had

burst in upon them from the west;" and, in another part of his work, that "the French disease, a new plague which had sprung up in the world, contracted by lying together and contact, was reckoned in his time incurable."

Nicolas Leoniceus of Vicenza, professor of physic at Ferrara, in a treatise, which he wrote in 1496, "De Morbo Gallico," observes, that "new diseases had appeared in Italy, which were unknown to former ages, after the manner of the lichenis, which, according to Pliny, Hist. Nat. lib. xvi. were never known before the time of Claudius." Then he continues: "Something like this has happened in this age; for now a new disease, of an unusual nature, has attacked Italy, and several other countries; however, this disease has obtained no proper name hitherto by our present physicians, but they commonly call it the French disease; as if the contagion had been imported by the French into Italy, and that this country was infected both by the disease and the arms of France at the same time. I, for my part, am forced to believe, (nor, indeed, can I conceive the case to be otherwise,) that this infectious disease, which has lately sprung up, has harassed this present age as it never did any former one."

Coradinus Gilinus, in his "Opusculum de Morbo Gallico," begins thus:

"Last year (1496) a very violent disease attacked great numbers of people, both in Italy and on the other side of the mountains, which the Italians call the French disease, affirming that the French introduced it into Italy; which the French call the Italian or Neapolitan disease, because, they say, they were first infected in Italy, and especially at Naples, with this cruel plague; or, because the disease appeared first in Italy, at the time of the passage of the French over the mountains. And as this disease is yet unknown to the moderns, and there have been, and still subsist great debates about it amongst physicians, I have therefore determined to write something upon it."

Dr. Astruc further confirms the opinion, that the disease was regarded quite as a novelty at the close of the fifteenth century, by numerous other citations from the works of the medical writers, who published within a moderate space after that period: as, for instance, Bartholemew Montagnana, Gaspar Torella, Anthony Bonevenius, Wendelinus Hock de Brackenaw, Jacobus Catanus, Peter Trapolinus, John de Vigo, Peter Maynard of Verona, Ulrich Utten, a German knight, who published his own cure by guaiacum, James à Bothincourt, Lawrence Philius, Peter Andrew Matthiolus, Alphonfus Ferrus, Jerome Fracastorius, Anthony Musa Brassavolus, Gabriel Fallopius, &c.

Not only is the foregoing statement corroborated by medical writers, it receives additional testimonials from several historians; particularly Mark Anthony Coccius Sabellius, in his *Chapod* Hist. lib. ix. first published at Venice in 1502; Baptiste Fulgosius, in his treatise on Memorable Actions, written in 1509; Jean de Bourdigné, in his History of the Province of Anjou, published 1529; Guicciardini, in his History of Italy, &c.

That the venereal disease first began to make ravages in Europe, and in particular that it afflicted many soldiers of the army of Charles VIII. at the siege of Naples, towards the close of the fifteenth century, appears then to be proved beyond dispute. But still other questions remain for determination. Was the venereal infection originally produced in Italy? or, was it conveyed thither from America, which had been discovered a little before the breaking out of the distemper in Europe?

We learn from history, that the new world was first found out by Christopher Columbus. In August 1492, he set sail

LUES VENEREA.

fell with three ships and 120 men, arrived at Hispaniola in December of the same year, and returned to Spain in March 1493. On the 25th of September following, he departed from Cadiz again with 17 ships and 1500 men, besides mariners and workmen; and, in November, he arrived once more at Hispaniola. In the following year, 1494, he dispatched 14 ships back to Spain. In April 1494, Barth. Columbus, the brother of Christopher, arrived at Hispaniola with three ships, which returned to Spain, about the conclusion of the same year, with Pedro de Margarit, a Catalonian gentleman, and father Bayl, a Benedictine monk: the former was, at that time, severely afflicted with the venereal disease. In August 1494, four other ships arrived at Hispaniola from Spain, under the command of Antonio de Torrez, and returned at the same time as those last specified. Lastly, in October 1495, John Aguado, the envoy of their Catholic majesties, came to Hispaniola with four ships, to inquire into the crimes of which Christopher Columbus stood accused; and, the year following, departed for Cadiz, where he arrived with Christopher on the 11th of June 1496, and with 200 soldiers, who were infected with the venereal disease.

The first conveyance of this distemper from the West Indies to Europe, by the followers of Columbus, is supported by numerous testimonies; among which are those of Anthony Musa Brassavolus, John Baptista Montanus, Gabriel Fallopius, and Roderic Diaz. These confirm the disease to have originated in the West Indies, and to have been brought over by Columbus's men; that it appeared in Spain first in 1493, at Barcelona, and there spread immediately through the whole city; that, in Hispaniola and the adjacent West India islands, the disease was very frequent and familiar to the natives, who had found out an antidote, called guaiacum wood; and, lastly, that the distemper in America was milder than in Europe, where, on its first breaking out, it was undoubtedly more severe than at subsequent periods.

This last circumstance is referred by some authors to the treatment being now better understood, and, in particular, to the efficacy of mercury, with which practitioners were formerly unacquainted. Others appear to think the distemper actually milder in its nature. Mr. Foot entertains the first of these opinions; while Astruc and Sydenham profess the latter. Our own observations have induced us to believe, that the disease has actually become somewhat milder within the last fifteen years: for, we are sure, not half so many bad and fatal cases are now met with in the London hospitals, as were seen about the close of the preceding century. If this be a fact, it cannot be ascribed to our more familiar acquaintance with mercury, though it may perhaps be imputed to better treatment: for there can be no doubt that many cases have been exasperated by the long, unremitting, and violent salivations, which the old surgeons, who were blinded by false fears and prejudices, deemed so essential to the radical cure of the distemper.

There is only one other sentiment, which we have to notice, respecting the first origin of syphilis, namely, that it was not brought from the West Indies, but began in Europe, as an epidemical affection. Mr. Hunter seems inclined to think, that the distemper did not originally come from the West Indies; and he was led into this persuasion by reading a short treatise, entitled, "A Dissertation on the Origin of the Venereal Disease; proving, that it was not brought from America, but began in Europe from an epidemical Distemper. Translated from the original Manuscript of an eminent Physician. London, printed for Robert Griffiths, 1751."

In our opinion, however, Astruc has adduced abundant proofs of the distemper having existed in Hispaniola, before it was at all known in Europe; and he has explained, as satisfactorily as can reasonably be expected, how the disease was conveyed from the West Indies to Barcelona in 1493, and to Italy shortly afterwards.

The subject, which we are about to quit, is highly interesting; though the time that has now elapsed, since the commencement of lues venerea in Europe, forbids any advantageous investigations of the controverted points. That the ancient leprosy could not be syphilis, Dr. Astruc has entirely satisfied us; and we join him in the belief that the latter disease was originally imported into Europe from the West Indies. It is unquestionably a matter of infinite curiosity, that the leprosy, common as it was in former times, should scarcely ever have made its appearance after the venereal disease spread over Europe; but this may not be more curious and unaccountable than the departure of the plague, and the access of the small-pox. See Astruc De Morbis Venereis, and Foot on Lues Venerea.

General Observations.—As Mr. Hunter has remarked, in whatever manner the disease arose, it certainly began in the human race; for we know of no other animal that is capable of being infected with this poison. It is probable, too, that the parts of generation were the first affected; for if the disorder had occurred in any other part of the body, it might probably never have gone further than the person in whom it first arose, and, therefore, never have excited public attention; but as it was seated in the parts of generation, where the only natural connection takes place between one human being and another, except that between the mother and child, it was in the most favourable situation for being propagated. Besides, as no constitutional effect of the poison can impart the disease to others, we are obliged to conclude that the first effects were local.

We know little about the syphilitic poison, if we exclude from consideration its effects upon the human body. It is commonly in the form of pus, or united with pus, or some such secretion, and, when applied to parts, it has the peculiarity of giving rise to a process, in which is produced matter of similar qualities to its own. In most cases, it excites an inflammation in the parts contaminated: but there is not simply inflammation: a peculiar mode of action is super-added, different from all other actions attending inflammation; and, according to Mr. Hunter, it is this specific mode of action that produces the specific quality in the matter. The peculiar mode of action, however, may exist without the presence of inflammation: at least, this inference is drawn, since the poison continues to be formed, and a healing chancre will communicate the disease to another person.

The formation of matter, also, though a very general, is not a constant attendant on this disease; for sometimes the syphilitic poison produces a kind of inflammation, which does not terminate in suppuration. But, according to Mr. Hunter, no venereal poison can exist, unless matter is formed. A person, therefore, having the venereal irritation in any form, not attended with a discharge, cannot communicate the disease to another. To impart the disorder, the venereal action must first have taken place; matter must have been formed in consequence of that action; and such matter must be applied to the person who is to be infected. We have no examples of this distemper being communicated by vapour, or effluvia, like many other diseases.

Mr. Hunter believed, that the circumstance of the virus being more or less diluted, in different cases, is not the cause of any variety in the effects produced, provided the dilution

is not so considerable as to prevent the poison from having any action at all. The same matter appears to affect very differently different people; and the diversity of the symptoms is, therefore, attributed to causes existing in the constitution and habit.

In treating of GONORRHOEA, we have adverted to the long disputed question, whether the virus of that disease is of the same nature as that which gives rise to lues venerea? We have there explained Mr. Hunter's reasons for believing in the identity of the two poisons, and mentioned the motives which have hitherto kept us from giving credit to the doctrine. Mr. Hunter declares that he has seen all the symptoms of lues venerea originate from gonorrhœa only; that he had even produced venereal chancres by inoculating with the matter of gonorrhœa; and that he had repeated these experiments in a manner in which he could not be deceived. (On the Ven. Disease, p. 293, &c.) He has referred the different effects of the virus, in these cases, to the difference in the nature of the parts affected. He maintains that the matter of a chancre will produce either a gonorrhœa, a chancre, or the lues venerea. Supposing the poison to be the same both in the chancre and gonorrhœa, why do not these complaints always happen together in the same person? For one would naturally think that the gonorrhœa, when it has appeared, could not fail to become the cause of a chancre; and that such fore, when it happens first, must produce a gonorrhœa. Mr. Hunter believes that this sometimes really occurs, although he confesses it is only seldom; and he suspects that the presence of one irritation in general becomes a preventive of the other.

The experiments made by Mr. Hunter with the matter of gonorrhœa and chancre, have been repeated with a different result. (See B. Bell on Lues Venerea, chap. 1.) On the other hand, the defenders of Mr. Hunter's opinion contend, that we cannot wonder at this contrariety, when we consider from how many causes gonorrhœa may arise, and how impossible it is to distinguish the venereal from any other. See Adams on Morbid Poisons, p. 91, edit. 2.

Having already touched upon this controverted subject, in speaking of *Gonorrhœa*, we shall here refrain from commenting on the arguments adduced against the identity of the virus, from mercury being requisite for the cure of chancres, and not necessary in the treatment of gonorrhœa. Neither shall we expatiate on the asserted experiment, that venereal matter, applied to the urethra, will produce a chancre in that canal, and not simply a discharge. We wish, however, in this place, to call the reader's attention again to the circumstance of gonorrhœa not being described as a symptom of syphilis, till nearly half a century after the other symptoms of the venereal disease were known. Fallopius was the first who set down a clap as an effect of the syphilitic virus. The fact of gonorrhœa not having been remarked as a symptom of lues venerea till so long a time after this last disease had been known, has been brought forward as another argument against the identity of the poisons from which these disorders arise. A late writer endeavours to place this matter in a very different point of view, remarking, that if the venereal gonorrhœa remained unnoticed till fifty years after the other forms of the disease were described; what does this prove, but that contagious gonorrhœa was so common, as to be disregarded as a symptom of the new complaint? Can there be a doubt (says Dr. Adams), from the caution given by Moses, that gonorrhœa was considered as contagious in his days? During the classical age we find inconveniences of the urinary passages were imputed to incontinence, and the police of several states, before the siege of Naples, made laws for preserving the health of such as would content them-

selves with public stews, instead of disturbing the peace of families.

In the opinion of the foregoing author, this is enough to lessen our surprise that gonorrhœa should be unnoticed for some time after the appearance of the venereal disease. But, according to his sentiments, so far is it from proving the difference of the two contagions, that the fairest inference we can draw is in favour of their identity. For, if fifty years after the breaking out of typhils, this disease began to be so far understood, that secondary symptoms were found to be the consequence of primary ones in the genitals, it is most probable that the first suspicion of venereal gonorrhœa arose from the occurrence of such secondary appearances, where no other primary symptoms could be traced. Adams on Morbid Poisons, p. 95, edit. 2.

We are glad that this gentleman does not mean these observations to afford any material support to an argument, which, as he acknowledges, rests on the basis of experiment. Every one will coincide with him that gonorrhœas must have prevailed from time immemorial, and hence, perhaps, were not regarded as a novelty, or even suspected of being syphilitic for many years after the first breaking out of lues venerea in Europe. Nor shall we dispute the probability of Dr. Adams's conjecture, that the occurrence of secondary venereal symptoms, where no primary ones could be traced, excepting a gonorrhœa, caused this last complaint to fall under the suspicion of being itself syphilitic. In these points we rather agree with the author; but we cannot perceive how they at all warrant an inference in favour of the identity of the virus of the two diseases. The antiquity of gonorrhœas certainly weighs against such opinion, inasmuch as it proves that some species of claps prevailed when the venereal disease was unknown, and could not possibly have any share in their origin. The silence of medical writers for fifty years after the venereal disease was known, in regard to gonorrhœa being a symptom of it, undoubtedly militates against the identity of the virus producing these affections, since it tends at least to prove that practitioners were unable all that time to discern any evidence in proof of the gonorrhœa depending upon the same poison as lues venerea. And when the occurrence of secondary symptoms, apparently unpreceded by any primary ones, excepting a gonorrhœa, first gave rise to the supposition of this last affection being itself syphilitic, the notion might be erroneous, and the secondary venereal complaints admit of explanation in another way. Among the received doctrines concerning lues venerea, the possibility of the syphilitic virus being absorbed from the surface of the body, without any ulceration of the skin, seems to have gained the general assent of modern practitioners. In this manner buboes, sore throats, nodes, eruptions, and other secondary venereal symptoms, may be occasioned. Such absorption is the more likely to occur where the cuticle is moist and thin. Many cases, where neither gonorrhœa nor chancre has existed, can be explained in no other way; unless, indeed, we suppose the sore to have been so trivial, and to have healed so quickly, as to have escaped the patient's notice or recollection. Secondary venereal symptoms may be produced in either of these modes, and yet, though no chancre can be traced, and a gonorrhœa, as happening to be a previous malady, falls under suspicion of being the original cause of the constitutional complaints, the notion may be on the above account entirely erroneous.

We are aware of the sentiment entertained by Dr. Adams and many other practitioners, that it is the nature of a chancre to increase in all directions till mercury is exhibited. However true this may be as a general observation, few surgeons of extensive experience will be persuaded that there are

LUES VENEREA.

no exceptions. We have heard it confessed by a surgeon, who has seen as much of the venereal disease as any man, that syphilitic sores, instead of spreading to an unlimited extent, will sometimes heal up without any mercury being given, the disease afterwards breaking out, however, in another form. Besides, who can doubt that guaiacum, and some other remedies, have healed venereal sores, though they may not have extirpated the disease in such manner as to hinder the access of future mischief? We shall presently find, on the authority of Mr. Pearson, that even bark, and other articles, will make primary venereal complaints give way, without the assistance of mercury. Mr. Clutterbuck, in a letter addressed to Dr. Adams, makes the following remarks: "I have seen cases which induce me to believe that the venereal disease, in some of its stages, and in certain circumstances, may get well without mercury, or any other remedy. But this is contrary to the doctrine of Mr. Hunter, who supposed that venereal actions go on increasing, without any tendency to wear themselves out."

"That lues venerea is much modified by climate and other circumstances, is generally allowed; that it has been cured by other means than mercury, we have also very sufficient evidence in the older writers on the subject: not to mention the late successful trials with acids and other substances." See Remarks on some of the Opinions of John Hunter, &c. by Henry Clutterbuck, p. 27.

Dr. Adams informs us, that according to the laws of morbid poisons, when a chancre has existed and been cured, a perpetual memorial of the event must be left, because the sore heals without granulations. In practice, we have so frequently seen this observation contradicted, that we are somewhat surprized at its ever having been advanced. Chancres are not only often filled up by granulations before becoming covered with skin; but there is actually a redundancy of such new substance, and we are obliged to repress it with lunar caustic. Mr. Clutterbuck has remarked, in his letter to Dr. Adams, "With respect to what you suppose a law of morbid poisons, that loss of substance in their primary ulcers is never supplied, but that skinning takes place immediately, as soon as the poison ceases to act, whilst, in the secondary ulcers of these diseases granulations as constantly take place and supply the lost substance; I suspect the difference to be rather owing to the nature of the affected parts, according to the greater or less readiness with which they take on and complete the healing process. Thus, for instance, in the confluent small-pox, the face alone suffers materially from pitting, though the skin on other parts has been equally crowded with pustules, &c. The traces of previous chancre are much more visible on the glans than on the prepuce." P. 71.

These and other reflections, stated in the article GONORRHOEA, make us disbelieve in the identity of the virus of this malady and lues venerea, as well as the possibility of secondary venereal symptoms ever in reality being the consequence of any kind of gonorrhoea.

The Hunterian doctrines respecting lues venerea produced a sudden and considerable revolution in the theories concerning the nature and treatment of this distemper; and, as they are still highly interesting, and continue to have vast influence over modern practice, we feel it our duty to enter a little further into the explanation of them.

The effects produced by the venereal poison appeared to Mr. Hunter to arise from its peculiar or specific irritation, joined with the aptness of the living principle to be irritated by such a cause, and the part so irritated acting accordingly. He therefore considered it as a poison, which, by irritating

the living parts in a manner peculiar to itself, produced an inflammation peculiar to that irritation, and occasioned the formation of a specific kind of matter, that could alone arise from that particular sort of inflammation. P. 19.

The following seems to us a very fair summary of the principal opinions promulgated by this philosophical and original character, on the subject of lues venerea.

1. That the venereal poison, being taken into the system, becomes universally diffused, and communicates such parts as are susceptible of the venereal action; and that it is soon afterwards expelled the system, along with some of the excretions.

2. That the parts contaminated do not immediately go into venereal action; but that they acquire a new state, or condition, which is termed a *disposition* to take on the venereal action.

3. That the number of parts contaminated does not depend on the quantity or strength of the virus absorbed.

4. That the *disposition* once formed in a part, necessarily goes on to action at some future period.

5. That mercury can cure the *venereal action*; but cannot remove the *disposition* which has been previously formed, and has not yet come into action.

6. That although mercury does not destroy the disposition already formed, yet that it prevents it from forming.

7. That although the disposition continues, it does not go into action during the use of mercury.

8. That the action, having once taken place, goes on increasing, without wearing itself out.

9. That parts once cured never become contaminated again from the same stock of infection.

10. That the matter of the secondary ulcer is not infectious.

11. That the venereal action is as soon destroyed in a large chancre as in a small one, the mercury acting equally on every part of the sore.

We shall now endeavour to describe the different forms in which syphilis presents itself to our notice; we shall then introduce some general observations on the treatment of the disease; and afterwards conclude with such remarks as seem necessary to convey the requisite information respecting the management of each particular case.

Of Chancres—Whatever may be the effect arising from the application of venereal matter to a secreting surface uncovered with cuticle, whether gonorrhoea, as Mr. Hunter represents, or a syphilitic sore, as Mr. B. Bell has asserted, it is admitted by all parties, that when the venereal virus is applied to any part of the common skin, a peculiar sore, called a chancre, is apt to be occasioned. This, which is the primary venereal ulcer, is generally caught on the parts of generation, in consequence of a connection between the sexes; but any part of the body may be affected by the application of venereal matter, especially if the cuticle is thin. In men, chancres usually occur upon the frænum, glans penis, prepuce, or upon the common skin of the body of the penis, the most frequent situation being the frænum, or corona glandis. The reason why chancres commonly affect these parts depends upon the manner in which such sores are caught, and not upon any greater specific tendency in the parts to catch the disease, than exists in other situations. They affect the frænum thus frequently, because that part is irregular, and the infectious matter is apt to lie undisturbed in the folds, by which means it has time to irritate and inflame the place where it lodges, and to produce there the suppurative and ulcerative inflammation. On

LUES VENEREA.

the other hand, since the matter is easily rubbed off prominent parts by every thing that touches them, they oftener escape the disease. In his common instances, chancres are seen on the scrotum, and even on the skin of the pubes.

In women, chancres mostly take place on the labia and nymphæ. In a few examples they are met with on the perineum. They are generally formed on the inner surface of the labia, though sometimes just on their edge, or even on their outside. Chancres have been observed in the vagina; in these cases Mr. Hunter suspected, that the sores never occupy such situation originally; but arise there from the spreading of ulcer on the inside of the labia. In women the ulcerations are apt to be more numerous than in men, because the surface, for the occurrence of chancres, is more extensive.

From what has already been observed, it must be obvious, that chancres may be caught in other ways besides coition. Whenever venereal matter accidentally comes into contact with any part of the skin, where a sore, cut, or scratch exists, or whenever such matter is applied where the cuticle is thin and moist, a chancre is likely to be the consequence. Mr. Hunter saw on the red part of the lip a chancre, which was as broad as a sixpence, and caught the patient knew not how; it was attended with bubo under the jaw, and might have been the consequence of infectious matter inadvertently conveyed to the part by the patient's own fingers. (P. 217.) In Dr. W. Hunter's lectures, mention is made of a midwife in extensive practice, who, having caught a chancre on her right fore-finger in examining a pregnant woman that had the disease, infected no less than eighty other women in the course of her business. That surgeons occasionally catch chancres by venereal matter lodging in a slight cut, or scratch, on their hands or fingers, is universally known.

It does not follow, as a matter of certainty, that because venereal matter has been applied to the surface of the body, a chancre is sure to ensue. The thickness of the cuticle, no doubt, frequently hinders infection, and the disease is often prevented by the matter being washed or rubbed away. It is believed, that some persons cohabit with diseased women with little risk, and we are told they are, for the most part, strong subjects, with a short prepuce, and of course the glans always uncovered.

It is a circumstance worthy of attention, that when a chancre is caught upon the hands or fingers, as related above, the virus seems constantly to operate more powerfully than when such a sore is formed in one of the usual situations. "I know a midwife," says Swediaur, "who having been infected in this manner several years ago, still suffers from the disease; and we have another instance in this metropolis of an eminent male practitioner in the same art, who, by delivering an infected woman got ulcers in his hand, and at this present time still labours under the consequences, though it is now three years since he received the infection. I know a gentleman, who wounding his finger by accident with a pen-knife, exposed it the same evening to infection, without suspecting any bad consequences; the wound changed in two days to a very bad venereal ulcer, accompanied with a painful and obstinate swelling of the whole arm, together with a bubo under the arm-pit, and symptoms of a general infection." *Practical Observations on Venereal Complaints*, p. 194, edit. 2.

The time, which elapses between the application of the virus and the appearance of a chancre, is exceedingly different in different cases, depending however, in some measure, on the nature of the part affected. According to Mr.

Hunter, the disease generally begins earlier in the frænum, or termination of the prepuce in the glans, than on the glans itself, the scrotum, or the common skin of the penis. This celebrated surgeon was acquainted with examples, in which chancres made their appearance as early as twenty-four hours after infection; but on the other hand, he mentions instances in which such sores did not begin till seven or eight weeks after the application of the virus.

The inflammation which precedes a chancre, like most other inflammations which terminate in ulcers, begins first with an itching in the part. If it is the glans that is inflamed, a small pimple generally appears full of matter, without much hardness, or seeming inflammation, and with very little tumefaction, the glans not swelling so much from inflammation as many other parts do, especially the prepuce. Chancres on the glans are also less painful and annoying than those on the prepuce. When, however, an ulcer of this kind affects the frænum, or in particular the prepuce, the inflammation is more extensive and visible. The itching gradually changes into pain. In some cases the surface of the prepuce is first excoriated, and ulceration afterwards takes place; while, in other instances, a small pimple or abscess is the forerunner of the ulcers as on the glans. The fore becomes surrounded by a thickening, which, at first, and while of the true venereal kind, is very circumscribed, and instead of diffusing itself imperceptibly into the surrounding parts, has rather an abrupt termination. The base of a chancre is hard, and the edges somewhat prominent. When the sore begins on, or near the frænum, it often happens that this part is quite destroyed, or else a hole is made through it by the ulceration. Hunter, p. 218, 219.

The indurated base, or surrounding thickening of a chancre, is a most remarkable symptom, and one to which surgical writers exhort us to pay considerable attention; for if the chancre heal, and a hardness remain, it will either break out again, when the constitution becomes infected, or the hardness will still be increased, as ominous and indicative of a constitutional infection. "This symptom, therefore, will always explain, by its presence, that the local infection is not radically removed; and by its absence that it is." If, by embracing the part, which was the seat of the chancre, the appearance be thin, so that the finger and thumb do almost meet, the cure may then be concluded to be perfect; but if a hardness and thickness remain, although it be healed, and if there be a scale upon the part where the chancre was, then the case must be deemed as not cured, and as requiring much more to be done for it." *Foot on Lues Venerea*, p. 413.

When chancres occur on the scrotum, or body of the penis, they generally first appear in the form of a pimple, which turns to a scab, and this being rubbed off, is succeeded by a larger one. Chancres, thus situated, are attended with less inflammation than such as take place on the frænum or prepuce; but with more than those on the glans.

When the disease advances, it sometimes partakes of the inflammation peculiar to the habit, and becomes more diffused, so as to produce phymosis, paraphymosis, and other disagreeable complaints, which tend to retard the cure.

The local or immediate effects of the venereal disease are seldom wholly specific, but partake of the constitutional inflammation. The first appearance and progress of chancres, therefore, should be watched, as the nature of the constitution may thereby be ascertained. If, says Mr. Hunter, the inflammation spreads fast and considerably, it shews a constitutional

constitution more disposed to inflammation than natural. If the pain is great, it shews a strong disposition to irritation. A strong tendency to mortification is also sometimes betrayed by chancres beginning in an early stage to form sloughs.

According to Mr. Hunter, venereal ulcers have no disposition to heal, which, generally speaking, is undoubtedly true. We may add, that the edges of a chancre are commonly jagged and vertical, instead of shelving, like those of most other sores; and its surface, before the administration of remedies, is smeared with a greyish viscid matter, which is in very small quantity, and said to have a peculiar smell. If a bit of lint is applied to the sore in this state, it becomes adherent to the part, the matter secreted not being enough to moisten and loosen the connection.

When there is a considerable loss of substance, either from sloughing or ulceration, a profuse bleeding is no uncommon circumstance, more especially if the ulcer is on the glans, the blood escaping from the corpus spongiosum urethrae. The ulcers, or sloughs, often go as deep as the corpus cavernosum penis, and give rise to still more copious hemorrhages.

A surgeon should never be too hasty in pronouncing sores to be chancres; the genitals, the common seat of a chancre, are, "like every other part of the body, liable to diseases of the ulcerative kind, and from some circumstances rather more so than other parts, for if attention is not paid to cleanliness, we have often excoriations, or superficial ulcers from that cause; also, like every other part that has been injured, these parts, when once they have suffered from the venereal disease, are very liable to ulcerate anew." Hunter, p. 215.

Until some of the virus has been absorbed from the surface of a chancre, such sore is to be regarded as entirely a local affection. Unfortunately, the time when this absorption happens can never be exactly known, so that, in the earliest stage of the ulcer, most practitioners are fearful of acting, altogether, as if there were no possibility of the constitution being already contaminated.

Some consequences of chancres will be hereafter spoken of.

Of Bubo.—A venereal bubo is an inflammation of an absorbent gland, and arises from the absorption of the syphilitic virus, which, in being conveyed from the surface to which it was first applied, towards the trunk of the lymphatic system, has to pass through glands, and in doing this, it often makes these parts inflame and suppurate. Venereal matter may be taken up by the absorbents under various circumstances. The least frequent way is where it has only been applied to some sound surface, without having produced any local effect on the part, but has been absorbed immediately upon its application. According to Mr. Hunter, another mode of absorption is where some of the matter of a gonorrhoea is taken up by the lymphatics, and carried into the circulation. A third mode is the absorption of the matter from an ulcer, and is by far the most common. A fourth way is the absorption from a wound. Mr. Hunter, perhaps, with great propriety, used to call every abscess in the absorbing system, arising in consequence of the absorption of venereal matter, a bubo, whether in the vessels or the glands themselves.

As these vessels and glands are immediately irritated by the specific virus before it has undergone any change in its passage, the consequent inflammation must, therefore, have the same specific quality, and the matter secreted in the swelling be venereal.

In considering the subject of buboes, Mr. Hunter di-

vided the absorbent system into the vessels themselves, and into their convolutions, or lymphatic glands.

The absorbent vessels are not so often inflamed as the glands, but when they are thus affected, in consequence of a chancre upon the glans, or prepuce, they generally appear like a hard cord, running from the fore along the dorsum of the penis. Such inflammations of the lymphatics sometimes arise from a thickening of the prepuce in cases of gonorrhoea, that part being usually at the time in a state of excoriation. These cords often terminate insensibly near the root of the penis, or the pubes. In other instances they extend further to a lymphatic gland in the groin.

The lymphatics, thus inflamed in consequence of imbibing venereal, or, at least, irritating matter, often suppurate, and this sometimes in several places, so as to produce as many buboes, or small abscesses, on the body of the penis.

Inflammation of the lymphatic glands is much more frequent than the foregoing affection, and is caused by the venereal matter being carried into them. The structure of these parts appears to consist of the ramifications of lymphatic vessels, which, after branching it, re-unite again. We may infer, from this kind of arrangement, that the fluid absorbed is, in some measure, detained in the glands, and thereby has a greater opportunity of communicating the disease to them, than to the lymphatic vessels, through which its course is probably more rapid.

Since the lymphatic glands are liable to inflame from many different causes, surgeons should be careful to discriminate such swellings as arise from the venereal poison, from others of a diverse nature. They should first enquire, whether there is any venereal complaint at a greater distance from the heart, as chancres on the penis, or, whether there has been any preceding disease in such situation. They should enquire, whether any mercurial ointment has been rubbed on the leg or thigh of the affected side, as mercurial frictions, thus practised for the cure of a chancre, will sometimes give rise to a glandular swelling in the groin, that may be erroneously taken for a venereal bubo. We are also advised by Mr. Hunter to observe, whether there has been any previous disease in the constitution, as a cold, fever, &c. He directs us, moreover, to pay attention to the quickness, or slowness, with which the tumour has formed, and warns us of the possibility of mistaking a rupture, lumbar abscess, and an aneurism of the crural artery, for a bubo.

Some cases seem to evince, that a bubo sometimes does not begin till several days, and even longer, after the virus has been absorbed, the chancres having been healed this length of time, before the gland begins to inflame.

The glands nearest to the seat of absorption are, in general, the only ones attacked. Thus, when venereal matter is absorbed from a sore on the penis, the glands in the groin are in danger of being affected. When the matter is absorbed from the vulva in women, the glands liable to be inflamed, are those situated between the labium and thigh, and the round ligament.

Mr. Hunter believed, that, commonly, only one gland is affected at a time by the absorption of venereal matter, and he suggests this circumstance as a distinguishing mark between venereal buboes and other diseases of the lymphatic glands.

The absorbent vessels and glands, situated beyond the first order of glands, or such as are nearest to the seat of absorption, are never affected. Hence, those near the iliac vessels and back always escape the effects arising from the absorption of venereal matter from the genitals. It is also observed by Mr. Hunter, that when the disease has been

contracted by a cut, or fore upon the finger, the bubo takes place a little above the bend of the arm, upon the inside of the biceps muscle; and that, when such bubo has occurred, none is, in general, produced in the arm-pit, which is the most common place for the glands to be affected by absorption. This celebrated surgeon, however, mentions two rare exceptions, in which buboes occurred as well in the arm-pit as above the elbow.

Mr. Hunter once suspected, that the reason of the second and third series of glands not being affected, might be owing to a change produced in the matter by the first glands, through which the virus passes. Reflecting, however, that the matter of a bubo is infectious, like that of a chancre, and that some of it can hardly fail to be taken up by the absorbents, he perceived that the above explanation failed. He therefore altered his sentiment, and concluded, that the internal situation of the glands, more remote from the seat of absorption than the first order, might prevent the venereal irritation from taking place in them. We may remark, that this reasoning will not account for the occasional production of a bubo in the arm-pit above another at the bend of the arm. It is possible, however, that, in this last kind of case, some of the virus from the chancre on the finger may arrive at the axilla, without being conveyed at all through the absorbent glands, which are situated at the inner side of the arm, a little above the internal condyle.

In men, buboes from a venereal complaint on the penis are situated in the groin. Mr. Hunter, we know, comprehended gonorrhœa among the causes, and, in this case, he thought, that both groins were equally exposed to bubo. When the swelling in the groin originates from a chancre, it is generally on that side of the body to which the fore is nearest, though cases happen which are exceptions to this observation, and admit of explanation by the anastomoses of the lymphatics.

Mr. Hunter apprises us, that the inguinal glands are not constantly arranged in one exact manner, and that, therefore, the course of the absorbent vessels must be subject to variety. Hence a bubo, from a venereal sore on the penis, has been a considerable way down the thigh, or in front of Poupart's ligament, or near the pubes.

As, in men, chancres are almost always caught upon the penis, so buboes in them are commonly situated in the groins; but we have already noticed, that chancres occasionally form in other parts of the body, and, of course, buboes are not necessarily confined to one situation, the nearest external glands, between the heart and the seat of absorption, every where in the body, being liable to share the same fate as those in the groin.

When buboes arise in women, unpreceded by any chancre, it is more difficult to find out whether they are venereal or not, than in men. For, in the latter examples, when they arise without any local complaint, it is known that no such complaint exists, and, therefore, that the bubo cannot be venereal, except by immediate absorption from a found surface. But, says Mr. Hunter, in women, it is often difficult to discover whether any infection is present or not; and the nature of the bubo can only be made out by paying attention to the way in which it began, its progress, and other circumstances.

When chancres are situated near the meatus urinarius, nymphæ, clitoris, labia, or mons veneris, the absorbed matter is carried along one or both of the round ligaments, and the buboes are formed in those ligaments, just before they enter the abdomen. Mr. Hunter believed that they never extended further, and he supposed them to be inflammations

of vessels, and not of glands. When chancres are situated far back, near or in the perineum, the absorbed matter is carried forwards, along the angle between the labium and the thigh, to the glands in the groin. Throughout this course small buboes may occur; or the virus, entering the inguinal glands, a bubo in the groin is frequently produced.

The bubo, says Mr. Hunter, commonly begins with a sense of pain, which leads the patient to examine the part, where a small hard tumour is to be felt. This increases, like every other inflammation that has a tendency to suppurate; and, unless prevented, it goes on to suppuration and ulceration, the progress of the matter to the skin being very quick. There are, indeed, some cases which are slow in their progress: in these, Mr. Hunter thought the inflammatory process was kept back by mercury, or other means; or else retarded by a serofulous tendency, such a disposition in the parts not so readily admitting the true venereal action.

At first, the inflammation is confined to the gland, which is moveable in the cellular membrane; but as the swelling increases in size, or as the inflammation, and, more especially, the suppuration advance, the specific distance is exceeded, the surrounding cellular membrane becomes more inflamed, and the tumour is more diffused. Some buboes become erysipelatous, by which means they are rendered more diffused and œdematous, and do not readily suppurate.

The following is then, according to Mr. Hunter, the true character of a venereal bubo: it is confined to one gland; it keeps within the specific distance, till suppuration has taken place, and then becomes more diffused. It is rapid in its progress from inflammation to suppuration and ulceration. In general, the suppuration is copious, considering the size of the tumour, and the abscess is single. The pain is very acute, and the inflamed skin exhibits a florid red colour.

Where no local disease has existed, the nature of a bubo will always be attended with more uncertainty, than when there has been some disease on the penis. As, however, every inflammation of the inguinal glands is suspected, the patient runs but little risk of not being cured if his case is venereal; but, (continues Mr. Hunter,) "I am afraid, that patients have often undergone a mercurial course, when there has been no occasion for it." P. 266.

The same distinguished practitioner thought, that there were two sorts of buboes arising without any visible cause. One kind inflame and suppurate briskly, as those buboes usually do which arise from chancres, or gonorrhœa. The manner of their progress made him always suspect them to be venereal.

The second kind are generally preceded and attended with slight fever, or the common symptoms of a cold, and they are generally indolent and slow in their progress. If they are more quick than ordinary, they become more diffused than the venereal, and probably are not confined to one gland. When very slow, they give but little sensation; and though the sensation is more acute when they are quicker, yet it is not so sharp as in the true venereal bubo. Besides, they do not commonly suppurate; but become stationary. When they do suppurate, it is slowly, and often in more glands than one, the inflammation being more diffused, and yet not very severe, considering the size of the swelling. The matter makes its way to the skin slowly, unattended with much pain, and the colour of the swelling is somewhat purple, instead of the florid redness which the surface of the venereal bubo displays. Sometimes the abscesses are very considerable; but then they are not painful.

In judging of the nature of a bubo, Mr. Hunter recommends us first to consider, whether or not there are any venereal complaints existing. If there are none, this is a presumptive proof, that the glandular swelling is not venereal. If the tumour is only in one gland, very slow in its progress, and gives but little pain, it is likely to be scrofulous. If the swelling is considerable, diffused, and attended with some inflammation and pain, then, in all probability, a constitutional action prevails, attended with lassitude, loss of appetite, want of sleep, small quick pulse, &c. Such swellings, (adds Mr. Hunter,) are slow in their cure, and are not affected by mercury, even when it is applied very early.

This gentleman likewise adverts to other cases, which he terms mixed, when the venereal matter, like a cold, or fever, has only irritated the glands to disease, producing in them scrofula, to which they were predisposed. In these examples, the swellings commonly arise slowly, give but little pain, and seem rather to be hastened in their progress, if mercury is given with a view of destroying the venereal disposition. Some suppurate under such treatment, while others, which probably had a venereal taint at first, become so indolent, that mercury has no effect at all upon them, and in the end, they either get well of themselves, or by other remedies. See Hunter on Ven. Disease.

With respect to the bubo which arises from gonorrhœa, we believe it is only sympathetic, or the consequence of irritation, though, as we have already stated, Mr. Hunter looked upon some of these cases as actually venereal, and originating from the absorption of the gonorrhœal matter.

Dr. Adams avers, that he is unacquainted with any instance in which the constitution has become affected in consequence of a bubo, without a previous chancre, or gonorrhœa; for the reader should understand, that even a venereal bubo does not imply a general contamination; the virus is only on its way towards the circulation, when it gives rise to the swelling in the groin. Dr. Adams moreover assures us, that he has never seen reason to repent the not having treated such buboes as venereal. "If," (says this gentleman,) "a bubo has been the consequence of an ulcer on the penis, which healed spontaneously, we may be certain that it is not venereal. It may be the effect of a morbid poison, as probably many of Celsus's were; it may be assisted by, and even heal under, the use of mercury; but this will be no proof of its venereal origin." On Morbid Poisons, p. 128. 2d edit.

Some additional remarks on buboes will be introduced when we consider the treatment.

Of Secondary, or Constitutional Symptoms.—By secondary, or constitutional symptoms, are commonly understood those effects which arise from the syphilitic virus being absorbed and carried into the common circulation. It is most likely, that in cases of chancre, the contamination of the system takes place about the beginning of the local complaints; for, in most instances, the chance of such infection happening afterwards is greatly lessened, by the patient having speedy recourse to the use of mercury, which generally acts as a preventive.

The absorption of venereal matter into the system mostly arises from a chancre, and Mr. Hunter joined in the belief, that it may also sometimes originate from a gonorrhœa. We have already adverted to the opinion, that the virus may possibly be observed, in some instances, without there being any fore at all produced in the seat of absorption, that is, where the matter is applied. Mr. Hunter thought, that this might

happen upon a half-internal surface, like that of the glans penis, though, perhaps, not on the sound skin. Venereal matter may likewise be received into the constitution by being applied to common ulcers, although not necessarily rendering these ulcers themselves venereal. Wounds also afford a surface for such absorption, but Mr. Hunter believed, that ulceration was always first produced.

Some parts of the body are much less susceptible of lues venerea than others; and many parts, as far as present evidence extends, seem quite incapable of being affected. Mr. Hunter never saw the brain, heart, stomach, liver, kidneys, &c. thus diseased. This celebrated writer divides the parts which are capable of becoming contaminated, in consequence of the absorption of the virus into the circulation, into two orders. The first order consists of the skin, tonsils, nose, throat, inside of the mouth, and sometimes the tongue. These are the parts commonly affected at an early period, after the passage of the virus into the constitution. The second order consists of the periosteum, fasciæ, tendons, and bones; parts which become diseased less early.

Mr. Hunter, with much appearance of reason, has endeavoured to account for this seeming greater susceptibility in some parts than others, by the manner in which the former are exposed to cold. Thus, he observes, the skin is continually subjected to more cold than the internal parts are; and the venereal disease always more readily affects parts so exposed than others. This may be the reason why the mouth, nose, and skin are affected with particular frequency, and also why the periosteum, and most superficial surfaces of the bones, are most liable to be diseased. The distemper, however, seems to shew some preference to such bones as are particularly hard.

In treating of chancres and buboes, we had occasion to observe, that the matter, in both these cases, partook of the specific quality, and, of course, was capable of communicating the disease. We have now to notice, that this is not the case with the matter of secondary venereal ulcers, or such as arise in consequence of the introduction of the virus into the system at large. Indeed, none of the secondary symptoms are infectious. As Mr. Hunter has stated, this form of the disease has not the power of contaminating parts, not already under its influence, even in the same constitution. Probably, the poison only irritates just after its absorption, and is soon expelled with some of the secretions, instead of circulating with the blood during the whole time of the disease.

Mr. Hunter has concluded one of his most interesting chapters with the following inferences.

First; that most parts, if not all, that are affected in the lues venerea, are affected with the venereal irritation at the same time.

Secondly; that parts exposed to cold are the first that admit the venereal action; then the deeper parts, according to their susceptibility for such action.

Thirdly; the venereal disposition, when once formed in a part, must necessarily go on to form the venereal action.

Fourthly; that all parts of the body, under such disposition, do not run into action equally fast, some requiring six or eight weeks, others as many months.

Fifthly; in the parts that come first into action, the disease goes on increasing, without wearing itself out; while those which are second in time, follow the same course.

Sixthly; mercury hinders a disposition from forming; or, in other words, prevents contamination.

Seventhly;

Seventhly ; mercury does not destroy a disposition already formed.

Eighthly ; mercury hinders the action from taking place, although the disposition be formed.

Ninthly ; mercury cures the action.

Secondary Venereal Ulcers.—These are of a very different nature from chancres, or such sores as originate directly from the application of venereal matter to the skin. They are generally much less painful than the latter, attended with less inflammation, and do not secrete matter, that can communicate the disease to others, or cause buboes in the patient himself. They are more readily formed on mucous membranes, than on the common integuments, and therefore are very frequent on the tonsils, and other parts of the throat. Sores of this description are often of a round shape, though, in certain examples, they eat away the parts, like herpetic or phagedenic ulcers, spreading from one part to another, destroying the skin, and healing on one side, while they are extending themselves on another. Richerand has seen ulcers of this kind, spread in this manner nearly all over the patient's body, producing one vast cicatrix ; and he adverts to a particular species of secondary venereal ulcer, which is of a round shape, and begins to heal at its centre, so that towards the termination of the complaint the sore represents an ulcerated circle, encompassing a round cicatrix. When this variety of the disease makes progress, the ulcerated ring becomes larger, while the cicatrix in the centre undergoes a proportional increase in size. (Nof. Chirurg. tom. i. p. 331, 332. edit. 2.) It may be doubted whether the latter cases are really syphilitic : they certainly yield to many remedies besides mercury, as our own observation has convinced us. They may be cured by guaiacum, nitric acid, a decoction of sarsaparilla, and elm bark, &c.

Venereal Eruptions.—On this subject Mr. Hunter has pointed out to us the following circumstances.

The appearances on the skin generally occur all over the body. The discolourations make the skin appear mottled, and many of the eruptions disappear, while others continue, and increase with the disease.

In other cases, the eruption comes on in distinct blotches, which are often not observed till the scurfs have begun to form. At other times, the eruption assumes the appearance of small distinct inflammations, containing matter, and resembling pimples, not being, however, so pyramidal, nor so red at the base. Mr. Hunter also observes, that venereal blotches, on their first coming out, are often attended with inflammation, which gives them a degree of transparency, which is generally greater in the summer than the winter, especially if the patient be kept warm. In a little time this inflammation disappears, and the cuticle peels off in the form of a scurf. The latter occurrence often misleads the patient and the surgeon, who look upon this dying away of the inflammation as a decay of the disease, till a succession of scurfs undeceives them. Mr. Hunter adds, that the discolourations of the cuticle arise from the venereal irritation, and are to be seldom regarded as a true inflammation, since they rarely have any of its characteristics, such as tumefaction and pain. However, he explains that in parts which are well covered, or which are constantly in contact with other parts, there is more of the true inflammatory appearance, especially about the anus.

The parts affected next begin to alter their appearance, and form a copper-coloured, dry, inelastic, cuticle, called a scurf. This is thrown off, and new ones are formed. Mr. Hunter relates, that these appearances spread to the breadth of a sixpence, or shilling ; but seldom more extensively, at

least for a considerable time. In the mean while, every succeeding scurf becomes thicker and thicker, till at last it becomes a common scab. Then the disposition for the formation of matter takes place in the cutis underneath, and a true ulcer is formed, which commonly spreads, although in a slow way.

These appearances arise first from the gradual loss of the true sound cuticle, which the diseased cutis cannot re-produce. As a kind of substitute for this want of cuticle, an exudation takes place, and forms a scale. The matter afterwards acquiring more consistence, at last forms a scab. However, before the disease has attained this condition, the cutis has ulcerated, after which the discharge is more like true pus. When this form of the lues venerea attacks the palms of the hands and soles of the feet, where the cuticle is thick, this latter part first becomes separated, and peels off. A new one is immediately formed, which also separates. In this manner, a series of new cuticles take place, in consequence of scurfs not being so readily formed as on the common skin. When the disease is confined to the palms of the hands, or soles of the feet, Mr. Hunter mentions, that there is difficulty in determining whether it is venereal or not : because most diseases of the cutis, in these situations, produce a separation of the cuticle, attended with the same appearances in all, and having nothing characteristic of the venereal disease.

When the affected part of the skin is opposed by another portion of skin, which keeps it in some degree more moist, as between the nates, about the arms, between the scrotum and the thigh, in the angle between the two thighs, on the red part of the lip, or in the arm-pits, the eruptions, instead of being attended with scurfs and scabs, become accompanied by an elevation of the skin, which is swollen with extravasated lymph into a white, soft, moist, flat surface, which discharges a white matter.

A venereal eruption often attacks that part of the fingers on which the nail is formed. Here the disease renders that surface red, which is seen shining through the nail ; and if allowed to continue, a separation of the nail takes place, similar to that of the cuticle in the above cases. However, Mr. Hunter states, that there cannot be the same regular succession of nails, as of cuticles in other instances.

Such surfaces of the body as are covered with hair may also be attacked, and the hair separates, and cannot be produced as long as the disease lasts.

Venereal Affections of the Parts about the Throat.—According to Dr. Adams, the venereal ulcer in the throat is always, what may be termed, a foul ulcer. Though its edges are defined, its surface is always ragged and uneven, of a complexion which can never be mistaken for a clean or healthy sore, that is, for a sore disposed to heal. The pus is of various colours, from the ashy-colour to the dusky brown. From the nature of the parts, a scab cannot be formed, so that the ulcerous appearance is never interrupted. Its progress is more rapid than on the skin, as every action of inflammation, ulceration, or healing, is always more rapid in these very sanguiferous parts. It is rarely attended with pain. On Morbid Poisons, p. 167. edit. 2.

When the throat, tonsils, or inside of the mouth, are affected, it is the nature of the disease to make its appearance at once in the form of an ulcer, without much previous swelling.

The venereal fore-throat should be most carefully discriminated from others, a thing that is not always at first very easy ; for sores in this situation, which are really syphilitic, sometimes have much the same appearance as others which

are not so. It is the character, however, of a venereal fore-throat to begin with ulceration of the surface of the parts. Now, as Mr. Hunter has explained, it is the nature of several other diseases, in the same situation, not to produce directly this kind of ulceration. One of these is common inflammation of the tonsils. The inflamed place often suppurates in the centre, so as to form an abscess, which bursts by a small opening; but never looks like an ulcer, that has begun upon the surface, like a true venereal sore. The case, just now mentioned, is always attended with too much inflammation, pain, and swelling of the parts, to be venereal. Also, when it suppurates and bursts, it subsides directly, and it is generally attended with other inflammatory symptoms in the constitution.

Notice is likewise taken, by this most celebrated surgeon, of an indolent tumefaction of the tonsils, which is peculiar to many persons of a scrofulous constitution. The complaint occasions a thickness of speech.

Sometimes coagulable lymph is thrown out on the surface of the parts affected, and produces appearances which are by some called ulcers, by some sloughs, and occasionally by others, putrid fore-throats. The case is attended with too much swelling to be venereal; and, with a little care, it may easily be distinguished from an ulcer, or loss of substance. However, when this difference is not obvious at first sight, it is proper to endeavour to remove some of the lymph, and if the surface of the tonsil underneath should appear to be free from ulceration, we may conclude, with certainty, that the disease is not venereal. Mr. Hunter states, that he has seen a chink filled with coagulable lymph, so as to appear very much like an ulcer; but, on removing that substance, the tonsil underneath was found perfectly sound. He adds, that he has seen cases of a swelled tonsil, having a slough in its centre, which slough, before its detachment, looked very like a foul ulcer. The stage of the complaint, he says, is even more puzzling, when the slough has come out; for then the disease has most of the characters of the venereal ulcer. Whenever he met with the disease in its first stage, he always treated it as if it had been of the nature of erysipelas, or a carbuncle. When the complaint is in its second stage, without any preceding local symptoms, he recommends the practitioner to suspend his judgment, and to wait a little, in order to see how far Nature is able to relieve herself. If there should have been any preceding fever, the case is still less likely to be venereal. Mr. Hunter informs us, that he has seen a fore-throat of this kind mistaken for venereal, and mercury given till it affected the mouth, when the medicine brought on a mortification of all the parts concerned in the first disease.

Another complaint of these parts, which Mr. Hunter represents as being often taken for a venereal one, is an ulcerous excoriation, which runs along their surface, becoming very broad and sometimes foul, having a regular termination, but never going deeply into the substance of the parts, as the venereal ulcer does. No part of the inside of the mouth is exempted from this ulcerous excoriation; but Mr. Hunter thought, that the disease most frequently occurred about the root of the uvula, and spread forwards along the palatum molle. He remarks, that the complaint is evidently not venereal, since it does not yield to mercury. He has seen these ulcerous excoriations continue for weeks, without undergoing any change, and a true venereal ulcer makes its appearance on the surface of the excoriated part. He says, that the excoriations in question have been cured by bark, after the end of the mercurial course, which cured the syphilitic sore.

This author describes the true venereal ulcer in the throat

as a fair loss of substance, part being dug out, as it were, from the body of the tonsil; it has a determined edge, and is commonly very foul, having thick white matter, like a slough, adhering to it, and not admitting of being washed away. Ulcers in such situations are always kept in a moist state, and the matter cannot dry and form scabs, as it does on sores upon the skin. The ulcer is also much more rapid in its progress, and generally has thickened edges. Hunter on Venereal Disease.

Dr. Adams, after reminding us not to consider every ragged ulcer of the throat as certainly venereal, takes occasion to remark, that he has seen more than one of this description, which has healed whilst he has been making up his mind, whether he should salivate his patient. He says, "the only distinction I know between these and true venereal ulcers, is that the former are usually attended with more pain, the edge is also for the most part less defined, and the surface itself is more irregular; the fever too, if any attends, is not such as we have described in syphilis. But the venereal ulcer is not always entirely free from pain, and there is generally some irregularity in its surface; the fever too, we have remarked, is often slight. Happily, this intricacy does not often occur, but often enough to teach us not to value ourselves on a hasty decision, when a little delay will be unattended with danger, and perhaps save our patient a tiresome and unnecessary process. By watching the ulcer attentively, we shall be able to observe whether it continues to spread regularly, though slowly, still retaining its character, and not healing in any part. If this should continue a few days, we shall have no reason to doubt its syphilitic character; but if the progress is slow, there can be no harm in a further delay, the only inconvenience attending which, will be the importunity of your patient. If, as is sometimes the case, from the nature of the part, and the irritability of the constitution, the progress of the ulcer should be quicker, the character in all other respects well defined, and the history of the case leading to a similar conclusion, we may, by using every possible means of introducing mercury, easily accelerate our course. This will rarely be very difficult, because the same irritability of constitution which produces an ulceration more rapid than usual, is for the most part attended with quicker susceptibility of the mercurial irritation.

"The same directions are applicable, whether the ulcer is seated on the tonsils, uvula, or palatum molle, or any of the neighbouring parts, excepting the tongue, in which case the progress is slower, the edges consequently thicker from the structure of the part, and the pain and inconvenience greater from the same causes, and also from its particular offices." (Adams on Morbid Poisons, p. 167, 168.) According to Mr. Hunter, lues venerea sometimes produces a thickening and hardening of the tongue. We have seen a case or two, in which this part has been studded over with large tubercles, or hard lumps, which yielded to mercury. We doubt, however, whether these instances were really syphilitic.

Venereal Affections of the Bones, Periosteum, Falcia, and Tendons.—Nodus-syphilitic Pains.—These complaints are nodes and pains in the bones. A swelling of the parts enumerated, originating from a syphilitic cause, receives the appellation of a node. We have already observed, that Mr. Hunter divided the parts in which secondary symptoms manifest themselves into two orders; the first comprehending the skin and parts about the throat and mouth; the second, the bones, periosteum, falcia, and tendons. These latter structures do not in general become affected till the disease has troubled the patient a considerable time, nor

before it has made its attack on the first order of parts. Mr. Hunter, however, had seen a few cases which were exceptions to this observation, the malady affecting the bones before any complaints of the skin or throat had happened.

When the deeper-seated, or second order of parts become affected, the progress of the disease is more gradual than in the first. The complaints produced bear a great resemblance to scrofulous swellings, and the effects of chronic rheumatism, excepting, however, that the joints are less subject to be affected. At a time when there has been no possible means of catching the infection for many months, a swelling will be formed on a bone, and having given little pain, will not be taken much notice of till it is of considerable size. In other instances the pain may be severe, and yet no swelling occur at all, or be perceptible for some time afterwards. The same remarks are equally applicable to swellings of the tendons and fasciæ. As it is the character of nodes to increase by slow degrees, they are not attended with much inflammation. When they attack the periosteum, the tumour being closely connected with the bone, seems in fact to arise from it.

The malady continuing to grow worse and worse, supuration takes place in the node; but the matter which is produced is not good pus. Some nodes, both of the tendons and bones, last for years, before they form any matter at all. These cases, Mr. Hunter suspected, might not invariably be venereal.

In cases of nodes the pain is sometimes very considerable, while at other times it is hardly such as to deserve notice. In certain instances, the tendinous parts, when inflamed, occasion a heavy kind of pain; and in other examples, they will swell very much, and yet excite no pain worth mentioning.

The pains arising from a syphilitic affection of the bones, are usually periodical, having exacerbations mostly in the night. Rheumatic pains, which the venereal much resemble, are also generally worst in the night. See Hunter on Venereal Disease, p. 328, 329.

Having described the secondary symptoms of lues venerea, as occurring in the first and second orders of parts, it remains for us to notice a few other diseases frequently supposed to be syphilitic.

Warts, Excrecences, &c.—Parts acquire, from the irritation of venereal matter, a disposition to form excrecences, or cutaneous tumours, called warts. These are most prone to grow where chancres have been situated, which sores, indeed, not unfrequently heal into warts. Such excrecences are liable to be hurt by bodies rubbing against them, and often a similar cause will make them exceedingly painful, and bleed very profusely. They are considered, by the generality of surgeons, not simply as a consequence of the venereal poison, but as possessed of its specific disposition, and, therefore, have recourse to mercury for the cure of them. Mr. Hunter observes, however, that he never saw mercury have such an effect, although given in sufficient quantity to cure, in the same person, recent chancres, and sometimes secondary symptoms. We cannot say that our experience is in support of this last observation, though we join in the belief, that warts are never venereal. In St. Bartholomew's hospital, it is the common practice to give mercury for the cure, and it is done with unequivocal success. But then the same excrecences might be cured much more judiciously either with the knife, ligature, or escharotics, according to the shape, size, and situation of them. In all these ways we have seen a lasting cure accomplished, without any employment of mercury. On the whole, therefore, we think with Hunter and Dr. Adams, that such complaints

never partake of the specific nature of the venereal disease.

With respect to other excrecences, those called rhagades, fici, and condylomata, were described long before lues venerea was ever heard of. The first are common in warm climates, particularly about the ends of the fingers, and are never venereal. "There are (says Dr. Adams) a number of soft excrecences about the anus, to which various names have been given. They arise sometimes in consequence of a discharge from the rectum, stimulating the neighbouring parts to ulceration. If such ulcers are prevented from healing by the discharge continuing, or by the friction of the parts, they must either ulcerate deeper and wider, or the cuticle will send out processes to defend them. These, on account of the pressure they receive, grow in various shapes, from which they have acquired their names.

"They will arise from a venereal origin in two ways. If a secondary ulcer is seated in these parts, that ulcer having no power of healing itself, will take the character above described, from the nature of the parts. Sometimes, also, the matter of gonorrhœa, by falling from the vagina along the perineum, will produce ulceration, and the same consequences follow. In either of these cases, the remedy which cures the first disease will cure these local complaints; or, if they afterwards remain, they will no longer retain their syphilitic property, and may readily be cured by topical remedies." (On Morbid Poisons, p. 173, edit. 2.) On this subject we must observe, that we have never seen more reason for considering such excrecences about the anus, as really syphilitic, than for regarding warts on the genitals in the same light. We speak of the excrecences alone, and not of any ulcers which may exist with them. These tumours may always be extirpated without any bad consequences, and mercury is unnecessary in the cure.

Among the secondary symptoms of syphilis, the venereal ophthalmia might be considered; but as we shall have an article expressly on the various species of inflammation affecting the eye, we shall postpone this subject till a future opportunity. See OPHTHALMY.

General Observations on the Treatment of Lues Venerea.—From the remarks already delivered, the reader must be apprised, that mercury is the grand remedy for all complaints unequivocally venereal. This is so much the case, that this medicine is usually regarded as a specific, and the only one to be depended upon for a cure. That mercury is powerfully efficacious in checking and curing syphilitic affections, is a truth as well established as any in the practice of surgery. But whether there may not be other substances which possess anti-venereal qualities sufficiently to be of service, and even preferable to mercury, under particular circumstances, and whether such remedies alone can ever be confided in for a permanent and radical cure, are questions of more difficulty and uncertainty. As long as many diseases present themselves, having nearly the same appearance as syphilitic complaints, and as long as mercury cures not one, but a hundred disorders, there will always be obstacles in the way of an easy settlement of these contested points. All men must first agree, that the cases in which the trial of any medicine is made, are decidedly venereal, or else the experiment will avail nothing.

If it be supposed that mercury is the only medicine to be trusted in the treatment of the venereal disease, of course we can have little more to do than relate the various plans of using this renowned remedy, and explain the principles by which its administration ought to be regulated. We mean, however, to be more impartial, and not totally silent respecting other medicines.

When lues venerea first invaded Europe, towards the conclusion

LUES VENEREA.

elusion of the fifteenth century, the consternation which the new distemper excited may be more easily conceived than depicted. The mode in which the malady was most commonly communicated, the unrelenting fury with which it proceeded from one order of painful and disgusting symptoms to another, and above all, the inefficacy of the several methods of treatment which were adopted by the physicians and surgeons of that period, furnished reasons but too cogent for regarding it as one of the most destructive scourges that had ever visited the human race. See Pearson on Lues Ven. Introduction.

The disease, however, had not raged long in this quarter of the world, when the efficacy of mercury in curing it was ascertained. The Arabian physicians had long been in the habit of applying mercury to the purposes of medicine. Rhazes, the Arabian author, by whom most of the oriental practice was communicated to European practitioners, recommended an ointment, in which quicksilver was an ingredient, for the cure of cutaneous eruptions. It was probably, therefore, from analogy, that Vigo, Berengarius Carpus, Fallopius, and others who practised at the time when the venereal disease first made its appearance in Europe, were induced to try the effect of mercury in the form of ointments and plasters, for the cure of cutaneous complaints proceeding from a syphilitic cause.

That the disease was unknown to Europeans before the return of Columbus from America, appears to derive material confirmation from the consternation, despair, and ignorance of the distemper, which are confessed by all the most learned practitioners of that time. Many of them at first refused to have any thing to do with the unfortunate patients, some of whom were expelled from human society, and compelled to seek refuge in the fields and woods. Fortunately, things did not long go on in this wretched manner. The analogical application of mercury was soon tried, and found strikingly beneficial. Berengarius of Carpi, who was the first that tried the effects of mercury in the cure of syphilis, soon made an ample fortune by the practice of the secret, according to the report of Fallopius. Berengarius and Vigo were almost the only practitioners who were acquainted with the important discovery of mercury being a cure for the new and dreadful distemper, and it was from their success, and the candid representations of Vigo and Fallopius, that mercury became the accepted and established antidote for the venereal disease. The old practitioners employed mercury in the form advised by Rhazes; they used it as an ointment, and, without knowing that the mineral was taken into the constitution by means of the absorbents, they continued the practice entirely from the beneficial consequences demonstrated to them by experience. When patients were afflicted with pains in the bones, the plan of applying mercurial plasters to the parts affected soon became a custom. The physicians and surgeons, at the time when mercury first began to be used for the cure of the lues venerea, were not acquainted with many chemical preparations of that mineral, and indeed, as it was regarded as a poison when internally taken, external ointments and plasters were alone deemed justifiable. The *hydrargyrus nitratus ruber*, however, was known to John de Vigo, who has recommended it as an application to chancreous ulcers. The internal exhibition of mercury was at first generally condemned; and so fearful were practitioners of the effects of this mineral, that even its external employment was conducted with the most extreme caution. In fact, the ointment which was at first used only had in its composition one-fortieth part of quicksilver; the proportion was afterwards increased to one-fourteenth, and lastly, to one-eighth. Besides ointments and plasters, fumigations were

soon introduced into practice; for as it was supposed that mercury produced a cure altogether by coming into contact with the part affected, it was judged necessary to contrive some mode of introducing mercury to sores in the throat, and for that purpose fumigations were adopted.
